Clodix, liex. 1he Gmonere an linglish pret, romanec-writer, and preacher, of consideralle reprytation, was burn at buldin, ahout $175 \mathrm{~s}^{2}$, and educatom at Trinity Callege there. He entered the English Church, and ultimately betanc liector of St Stephenis, Wallarook, Lomlon, Itis first work was a pern, entitled Petris in 181.5 From this time al, to within a short period of his death, which tork place November 24, 1860, hís pen was almost ineessantly at work-on satire, comedy iragely: romance, tales, liography, magazine artieles, and the weightier matters of religion. Few subjects eane aniss to lim, and he exhiliterl considerable talent in the treatment of must that he tonchal upon. Jis best known work is the romane of Saluthiel. C. was also famons for his eloquence as a pulpit orator.

CRO'MARTY, a parliamentary hargh and seapont in the umited eounties of lioss and Cromarty, on a low peninsula between the Moray and Cromarty Firths, on the sonth side of the entrauce into the latter, and is miles morth-north-east of tiverness. It is irregularly built, and its ohler streets and lanes are in the homely Flemish architecture prevalent in the ohl towns of the morth of Sentland. The harbour admits vessels of 400 tons, and the hay afforls execlleat anehorage for wind-boum vessels. Fop, 1988. It has manufactures of ropes, saching, saildoth, beer. The chief industry is the heminy and white fisheries. O, has declinel innch since the rise, on the north side of Cromarty Firth, of Invergordon, which is more contignous to the important districts of Easter and Wester fioss. C. unites with Kirkwall, Wick, Dingwall, Dornoch, and Tain, in returning a member to parliament. In the vicinity of C. are a lighthouse and coast-guard station, and within two miles are some caves, and an arch, called Macarquhar's bed, in the old rel sandstone, which rises in some parts 250 fect. Near C. are remains of ancient chapels and camps. Hurh Miller, in whose memory a monment has been erected in the neighbourhool, was a native of c'romarty.

CROMARTY F1RTH, a lambocke inlet of the North Sea, on the north-east coast of Scotland. just north-west of the Moray Firth, ant enclosed by parts of the comities of Cromarty and Iioss. It forms a noble harbour, 18 miles long, rmumat southwest, 3 to 5 miles broad, and 5 to 85 fathoms decp. It receives several rivers, the Coman, cutering at its upper end, being 35 miles lons. The entrince to C. F. is by a strait between two high wooded sliffs or heallands, the North and South Sutors of Cromarty, ouly It mile acrose, with 12 to 30 fathoms of water, and with the Three Kings Tecf, ahout half a mile off land. Near the Firth are the buwns of Dingwall, Invergordon, and Cromarty. The largest tuet could ride safely sheltered in this fine slicet of water. In the oll red sandstone, near the mouth of the Firth, Jugh Miller discovered the fossil fishes Pterychthys, Ostculenis, \&e.

CRO'MARTYSHIRE, a county of the north of Scotland, intimately connected, geographically and politically, with Ross-shire, and consisting of ten detached portions in the interior, and along the northem horulers of Ross-shire. Area, 34 square
milas, or undur an wheth of linss-shins. Sec lions and Cramany shmas.

CROMLWCH, the name whilh has come to lum generally used amone archwolosists for a muld structure of two or inere unhewn strins, flacma erect in the carth, and surpmonting a larger stonc.alow unhewn, the whole forming an inpwrect lind of chamber or enelosure. The etzzander of the word C. Alocs not seem to lie aseortained, hit it is loclieved to lo Coltic, and to simify the "hont', "Wmanss" 'inclined,' or 'snepeaded' stone. When a where the term was hirst arplient, scems also to be nucertain, but it wouk alliear to have originated amony antinuaries. The namuments which it has buch employed to designate are kown amony the rom. mon puple by cther names, such as "the miant's quace,' 'the giant's limb,' 'the giant's quait,' 'the fairies' table, 'the deril's tahle, 'the mivel stone, 'the old wife's lift,' the hag's leak, and the lako. The name dolmen, a feltic word, which is said to simify a stome taile, is given to them in lranee. Sue Dommes; sec, also, Sepelminat, Duesins.
(romlechs are foum in Englant, Wales, scotlani, Irelami, the Chanacl Isles, France, spain, Cermany, Demmarl, and some other conatries of Limon: in Hindustan and elsewhere in Asia; and in America.

('mmlecin.
They are gencrally without any enclosure; but occasionally they are fened romin with a ring of unlern stumes. in a gom many instances, cromlechs hare heen discurved in the heart of earthen mounds or barrows. Insuch eases, the rude chamber or enclosure of the $C$ ' is foum to contain sepulchral remains, sum th as skcletons or urns, together with weapons or ornanents genurally of stone or bome, fragments of pottery, and hones of ammals. similar remains have been foum in the chambers of cromlechs not kuown to have ben at any time covered by liarows. These facts have led modern arehacologists to believe that the C . was a sepulchral momment. The theory of the older antiguaries,
that the C. was a Armilical altar, is withont any fomudation in what has been recorded of the druidical worship by trustworthy writers. In Flanders, a 1 . containing lioman remans has been dug up in the midule of a limman cemetery ; and in a
 and frugments of urns were disenvered, along with Foman cuins of the emperss Clanlins Gothicus (268-207), Constantine the Grent ( $2(06-3: 37$ ), Comstantine the Vonnger ( $337-310$ ), and Yialentinian I. (36t-375).
tmone the more remarkable cromlechs in England are Kit's ('oty Honse in kent, Wayland Smith's Cave in lierkshire (commomorated liy Sir Walter Seott in Kemiporth), and (Clom (unuit in Cornwall. The weight of the llat stome in this last ( 1 , is estimated at alomet twenty toms. Th the Marguis of Anglesey's prank at I'las Newgild in Wikes there are two cromlechs close bosile each other: in the larger, five erect stones summt a flat stme about twelve feet long. ten feet wile, and from three feet and a half to fome feet amb a hali thick. Cromlechs ate comaratively rare in seotimul. The bust among the well-ascertained examples is perhaps that called 'The Anld Wife's Litt,' near ('raigmedan dastle. in the parish of Haldernock in Stirlingshire: the recumbent stone, a mass of basalt, is eighteen feet lous, eleven feet wide. and six or seven fect thick. and the two stomes which smport it are of mearly the same size. It may bedoulted if the partioll edevation of the 'Witch's Stone" at Romminatom Nains, near latho, in the comnty of Elinbmy, has not ben frulued by matural canses. Among the hrish cromlecls, one of the most striking is that of kill teman, alant six miles from Tullin: the recmment stone, which rests un six lucks, is twenty three fect and is half long, sepenteen feet wide, and six feet and a hadf thick. A eromech called "The Broadstam,' in the comaty of Antrim, is surmmded by a circle of stamling stmes, or erect mhewn pillars. A crometh in the l'hemix f'ark, Dallin, was disconered in lsous in remorine a laye larrow: specimens of the sepmlehral remains finm in it are shewn in the Insemm of the Doyal Irish Acaleny.

On the retnin of the amy to Landm, the Ireslyterians, who werestill inimily temprising with the king, to the number of mome than 100, were driven out (1) ectalar libtb) liy the process known in history as 'I'rim's P'mere' 'Thun that which ('. thought cmald alone end the strif." happencel. In January lote, the kine was tried, cimdemmer, and exeched. The aloblition of the Homse: of Lords fohlowed spectily, and C. Decame a prominont member of the new Comell of State; and in the aruy, thmuh still mory limutemant-generall, he hat really much more influence than the commander-judin f. The royalists bumig still strong and rebellimes in lreland, C. went thither in Aurnst, with the title of lord-lientenant, and commander-in-chicf of the army there : and ere nine months had passel, he had subulum the comentry so fir, that it might le safuly luft to the keging of his sno-in-law, Iretom. ( $\because$ measures for crushing the hrish pedels were imken severe, aul ceen samginay, but, nevertheless. puate and presperity followed in a dengere manmwn lufare in the history of that manapy comentry: Alfans in Sentand now elanmed (e's attombion. Sowth commissimers hat been negentiatins with tharles 11. at breda, had urged hime to come ammue then and take the covenant, and they womld crown him ling over them at least, and din what fore of anns conld do to make lim kine of Endend alono Charles arrived in the moth of sentlame on the 231 June 1620; three hitys thereafter, '1anmed
 the lreshyteriansenteh was apminted ommanaler-in-chaf of all the parianment fores. "Wa the lath of July, Charles stant had signel the lonemant, and was fully acconten as king. (ha the :at Geptember following, $C$ ronteri the senteh army at Dunbar. 'harles, whth what force momanen, aud other aecessions, afterwats marched simthwant, anil lad dunctrated to Wherester, when ('. cane up with him, and utterly orrethew the royalists on the amiversary of the Battle of Dunbar. This hattle phated (. aromerly at the heal of phlic affairs in Enuland, and to werte his brorraldy from this time unth his death, would be to write the history of the Commonweaith. The Long I'arliament harl now degenerated inter the 1 immp-hal become in truth, an migarchy. given to hom and uecless discussions abont mere techasalitios-intoleradle to the conntry
alike for the extranminary power it possessed, and for the weak, pusillanimons way in which it exercised it. C., therefore, dissolved the [ump, 20th Apri] 1650, and henceforth he alone was ruler in England. Ife immerliately summoned a parliament of 140 persons, 138 of thom assemiled on the sth July, lant he found it wecessary to dissolve it on the 12 th December; its one great work having been the legal investiture of C . with the surreme power and the title of Lom Protector, a position upon which the pincipal foreign powers hastened to enogratulate lim. C. now neted in a rery arbitrary manner, so far as his parliaments were concerned, calling them and clismissing them at pleasure: but his home poliey, notwithstanding. was just ani liberal towards the mass of the peonde, and conducive to the prosperity of the comtry; while his forcign policy was such as to secure England a position among nations more commanting than any she had ever oceupied lefore. Uuder C.'s rule, swift retribution followerl any indignity or injury to Englishmen, no matter by whom or where perpetrated; and religions persecutors on the continent, in terror, stayed their bloody swords on the stern summons of the Lord Protector. He died September 3, 1658, the anniversary of some of his most important vintories. C. was huried in Westminster Abley; but on the 30th January 1661 (the anniversary of the death of Charles I.) his grave, along with those of Ireton and Bradshaw, were broken open, the eoffins draggeil to Tylnum, where the moulderinge bodies were hanged, and then thrown into a deej, hole under the gallows, while their heads were set upon poles on the top of Westminster Mall. Such was the saerilegions bintality of the ling and clergy (for the decd was dome ly their anthomity) towams Eugland's greatest ruld. It was lung a fashion with historians, content to rely nyon the ealumnies and falsehoods of royalist writers, to rewesent $C$ as a monstor of crnelty and hyy wericy--a man with a natural taste for bloml, what main use of religions fhraseolngy merely to subserve his own ambitions ends; but after the researches of carlyle and Guizot, the eloquence of Nacaulay, and the elear statement and sombl sense of Forster, such a ficw can wo longer the mheh. U's religion was no mere profession, it was the very cssence of the man: liy nature, he was mut a lifol-shember, and when neecssity demanded the grim exorese of the swort, lio masheathel it with relnctance. Nejer was a rcligions man less of a liggot; he wonl not, in so far as his iron will could edfect his purpose, permit any ane to be persecuter fur religions mminos. Ile dehivered Bidale, the foumder of Englishe 1 Tritrianism, wat of the Lands of the Westminstu divines. Ite would hase even given the dexpisen ank perswented Jews the right hand of citizonship. He erasped lower, and dispensed with the formality of parliaments, only because he smucht to pronnte, in the specdiest possible mammer, the $\mathrm{p}^{\text {rosperity, }}$ happiness, and ghory of his native lami.

CROMWELLE, Richaien, son of Oliver (romwoll, 1 mod I'rotector of Eugland, was loom at Huntinglun, October 4, 1626. In carly life, he was noted chiolly for lis imdulence and love of pleasme, gualities that miterl him more elosely to the cavahers than to the party of earnest men of which his father was the chicf. When Oliver attained the dimnty of Lard Protector, he called his sma from the olscurity of a country-lonse, and his firle-spurts, to have him clected for the coments of Mommonth and Southamptom, alpointml him Fimat lomd of Trule and Navigation, aml mate him 'hancollor of Oxforl. In none of thess capreitios did lichard 6 . exhibit any aptitued: anl his failure as I'rotector, to which high ofiow
(being the eldest surviving son) he sucected. on the death of his father, Seltember 1605-was still more conspicnous. With a mediocre intcllect, and no enerry, hardly a friend in the army, and the first parliament he called against him, the result could not be atherwise than it was-his demission (April 1059)-little more than seven months after lie had assumed the sceptre of the Commonwealth. He retired to Hampton Comt, from whence parliamentary stinginess and pressing creditors soon drove him to the contiment, where he resided for a considerable period. At length, returning to Englanct, he hai a house provided for him at Cheshmot, near Loudon, where he resided in strict privacy natil his death, in 3712.
Cromiwelds, Tionas, an emment English statesman and ecclesiastieal reformer, of the reign of Henry VIIf., was born near London in very humble circumstanees, lis father being a backsmith, about 1490. Aiter receiving but a very meagre education, he went to the continent, and bocame clerk in a factory at intwer 1 , where he deroted his spare time to the accuisition of languges, in which he beeame very proticient. In 1510, he went into Italy, where he appears to have resided until about 1517 , when he returnel to England; and, after some time, was received in to the household of Wolsey. That prelate, speedily recognising his abilities, made him his solicitor aud elici agent in all important business. As a member of the Honse of Commons, C. warmiy and successinlly defenked the fallen minister, his master, agninst the bill of impeachment-proof enough that he was not the heartlessly amlitions man that his enemies have represented him. Hemy, arbming his chivaby, and appreciating lis talont, made him his own secretary; kuighted him in 1531, and mate him a privy-councillor. Honoms rapidly dowed in upon him; pratly in consequence, it is said, of lis liaving suggested to Henry the desirableness of throwing of the piapal yoke altogether-an idea which suited well with the king's impetuons nature -but chiefly, no innlot, on aceomit of his great abilitics. In 1534, he had become chief Secretary of State, and Master of the liolls; in the following year, he was mule Visitor-general of Enghish Mon-asteries-which he afterwards suppressed in such fashion as to olitain for himself the designation of Mallews Monachomm-and keeper of the privy seal in 15:it. In 15:3-to pass over a variety of minor thanens of royal approhation - he had risen to be Earl of Essex-having had some thirty monastic manors anl estates given to him to keep up the dignity of his title - and Lord Chamberlain of England. C. took the lealing part in establishing the doctriucs of the liefomation, though he seems to have done so less on religions than on political grounds. The destruction of the Pope's authority, and the estallishment of the supromacy of the king in Eng. land, were what he Ialoured to effect ; aml with this viow, lee pomulgated the articles of the new faith, had Enchish Eibles phaced in the ehurehes, and the youth of the nation taught the Creed, the Ten conmandments, and this Lad's Prayer; and ordered the removal of all images from the altar. In this matter of ecelosiastien pulity, he has, says Mr l'ronde, in the thiri volume of his Mistory of Englemel. 'Ifeft the print of his iarlividual genins stamperl imlelilly, while the motal was at white hoat, into the constitntion of the country. Wave after wawe has rolled over his work. Comanism fluwed lack wor it umber Mary; Puritanism, under anothor evon grander. Cromwell, overwhelmed it. Bat limmanisn chued agan, and loritanism is dead, and the polity of the Chureh of England romains as it was loft ly its ereator.' In all that eom"emmed the state, in its vastest and most
complicated foreign mlations, as well in the smallest matiers of sanitary refom at home, (1) tomk an active prosonal interest. Lind the stom, almust samate manner in which, in the earying ont of his prolicy, he disposel of all whonpmosel him, hol tomany amd lour complaints, which damarend som what his poph-
 gromat, le was zealons in pernotine the marriage of It ary with Anne of blowe, from whon, on acomat of her known Latheran temberies, he "xpented strong support. 'I'he suceess of his effints in this matter provel the ntter min of C., fore the kins, early concciving is strong aversion to his monely fucen, extended that dislike to the minister who had so strenonsly promotel the mariage Cumplaints against (. poured in thicker and faster, and the royal car was not muwilling to listen now. C'hames of malversation and treason were made, and low was arrester and thrown into prison (10th June 1540) : a lith of attainder was spuckly drawn up, ane passed the two Mouses of I'mliament with little dillieulty; and on the 2Sth July following. C. laid his head ou the hloek on Tower Hill. A statesman of undonbted genius, he saw what was hest for his comntry, and did it-not certainly in a way commending itself to the judgment of the present time - lnt, jerhaps, among the best and only sure morles that could he devised in his age. Ite was undoult. edly unscrapulons, and wery hanghty towards the ligh; but the pour and weak found hime casily aceessible, and, when wronged, a wam defenter; and though he was rapacious, the humgry had, nevertheless, to thank his generosity for many a meal.

CRO'NSTADT (Hmagarian, Pre(rso), a town of Transylvania, romantically situated amin the East Carpathians, at an elevation of 900 feet above the sea. Lat. $45^{\circ} 36^{\prime} \mathrm{N}$, long. $29^{\circ} 33^{\prime} \mathrm{E}$. It consints of an inner town, surrounded liy walls, and of three petty extensive suburls, the poplation being ahout 30,000 . The centre town, which dates from the 13 th c., is well and regularly luilt, and contains some handsome maidings, the chicf of which is a Gothic Protestant claweh, built in the 14th century: This part is almost exclusively imhahited by Saxons. The sulturls, surrounded with gardens and orchards, with here and there the hoary ruins of some oli castle, or the sloping romfs of some modern vill:i, rising alove the trees, have a pleasant anl pieturesque appearance. The suburs are chinly ncemped ly Wallachs and Magyars. Iinens, cottons, coarsc woollens, hosiery, paper, \&c., are manfactured here in considerable quantitics. U. was the first town in Transylvania where a printimgreps was established, and the first issues from it were the dingsiony Confassion, and the works of Luther.

CRONSTADT, a strongly fortilied scaport, abont 20 miles west of St Peterslourg, on a narrow calcareous island of about five miles in length, at the narrowest part of the Gulf of Finland, and over against the mouth of the Nevi. Lat. (of cathedral) $59^{\circ} 59^{\prime} 46^{\prime \prime}$ N., long, $29^{\circ} 46^{\prime}-38^{\prime \prime} \mathrm{E}$. C. is at onee the greatest naval station and the most flowishing commereial port of Russit. It was founded by leter the Great in 1710, the island having been taken from the Swedes hy him in 1703. Its fortifieations. which protect the approach to St letershurg, have been an object of great attention to the Tinssian government. The batteries are very mumerons, atefending every part of the channel ly which vessels can enter. 'llicy are all huilt of granite, and armed with the heaviest ordnance. The place, indeed, was considered by the Pritish admiral who recomoitred it during the Fussian war of $1854-1855$, so impregmable, that it would have heen utter mandess to make any attempt upon it. C., which is the seat
of the Rusman Achanaly, has threc harlours: the coist, intumbel for vosisults of war, and capable of
 harlome, when wessels are fittel up amd repuired,

 merchant-shipminer, with capacity for fofo vessals; all are adminally dofonden, Not only the trake
 Dut that of a great part of the intorm of lanssia,
 and camals. (', matains many well-hailt houses: the permation in winter, when the plase is almant

CROOK, belomging to musical instruments, surh as the Frouch-hom or trumpet, is a circulat tulu. which fits into the end of the instrmment next the mouthpiece, for the parpose of making the pitch of the instrument suit the kry of the masic ; the nothes of the parts for these instruments leing alway: written in the matural key of 19 , witl the nam of the key of the picee marked in letters.

## Cliook, Shermerd's. See Pastoral Stafe,

CROOKED ISLAND, one of the Lahmas, contains lfousquare miles, and aloont 1 sef inhabit ants. It lies to the sonth-east of long lsland, of which the north-west extremity forms urarly the midille point of the chain. lin common with sone "thers of the group, it is valuable charfy for its salt In the exportation of this article, $\because \mathbf{I}$. appars $t$ stand thimi in order, its share havinge in 15.51, ammutcel to 112,578 lonshels. The Bahama Salines are all the more important frum the fact, that, for the curine of ish, salt oldained hy solar evaporation is preferred to that procurel from mines.

CROI', or OUTT- ROOP, is the edge of a stratum where it rises to the surface, or, as the miners say, comes ont to the day. The line of cut-crop of a leod along a level surface is ealled its strite; it is deseribed lyy its redation to one or other of the points of the compans.

CROSLER, a staff summonted lis a cross, which is carried before a hishore on solemn oceasions, it is ahont five feet long, is senerally malle of tin. and is hollow, Crosiers are generally silt, and are oftern richly omamented. 'The C. differs entirely from the pastoral statl? with which it is oftem nevertheless com-fonmer-the latter having a circular heal, in the form of a cronk. sulyninel is an illustration of Archhisluy. Warham's crosier (1520) from Cantembry Cathedral.

CROSS The ( C . was a common instrument of capital $p^{m m i s h m e n t ~ a m o n e r ~}$ the aucients; and the death of the $\mathbb{C}$ : was estemel so dishommande that miy slaves amd malefactors of the lowist class were subjected to it ly tho Rumans. It was enstomary to proclam the mane amd offence of the person crucitical. on to allix a taluct (nlomm) to the C., (m) which they were inseribel. Dalefacturs were sometimes fastench on a simple upright stake, and sin left to die, or they were impaleal num it, and to this uprighit stake the Latia name crux was originally and more strictly applicable: lnat verr gencrally a cross-piece (patilulum) was addal to the stake, to which the arms of the eriminal were tied, or to which his hands

## cross

were nailed. When the crosspiece was fastencol at right angles below tho summit of the wright stake, the C'. Was called omer immisva; when the crosspiece was fastened at right angles across the top of the wright stake, the ('. was crux commisace; ant when it wis formed of two leans crossing one another miblipuly, it was comr derussatu. The C. was erected with ont the gates of towns, lat in places of frequent resent. 'l 'lee prison ermeitied often liven for days upon the cross. The death of (heist ha crucifixion led floristians to remand the $[$. with pemliar feelings of resernoce, amd to make ne of the sion of the (') as a holy amt distinguishing sign. 'The custom of crossing, in honour and commemoration of closest, can le traced back to tho 3 l century. 'The Emperor Constantine, after attaining the victory offer Maxestins, through the influmes-as he believed-of the sign of the ('., consed crosses to be set up in public places and upon public holdings ; ant the veneration of the ( $C$. increased, partiendarly after the Invention of the ( C , or intine of the alleged true C' of ('heist in Jerusalem by the Empress Helena. See Chose, Invention ur. The desire for reties was gratified, and mmalerless portions of the trio $C$. were given away, without its being diminisherl. Iconoclasts and iotlues contended in vain against the prevalent worship of the ( $:$ : and the cromitir (11. v.), a $(\therefore$ with an image of the Savior affixed to it, was lionomed more than any other image. 'The sign of the C' is made not only ley Roman ('atholies, lat ley the members of the Caster churches also; there are, however, distinctive differences in the manner in while it is made. It is admitted by the Lutherans as a commemorative sion of the atoning death of Christ, but by many Protestants is rejected as a haman invention in worship, and as tending to super ratition. It was very generally used chang the middle ages, ant still is among the less enlightened peasantry in some Gammon ('athotic countries as a Sort of cham, or as alluring some smarty, like an amulet, against all evil, and particularly against evil spirits and witeleraft.

It appears that the sign of the $C$. was in use as an emblem, having certain religions and mystic moanimes attached to it, loner before the ("histian era; and the spanish eomplerons were astonished to fine it on oljocet of regions veneerstron among the natives of central and south America. lie this as it may, it was carly moment? as a symbol by Christians, withe express reference to the central fact of then reliequm, ane it has lean extensively used as an moment in ('haristian arehilecture, and in the groumbpan of ehmrehw (f. v.) The C. of the lissmmetion is

 national amen of the linglish previous to the mann with scotland. 'Itu C. nf St Andrew altered
entirely in form from the Latin or Greek cross. This C., nu ram decussutif, consisted of two shafts of equal length crossed diagonally at the middle, as in the annexed cut. According to the legend,

## Greek Cruse. Latin Cross. St Andrew's Cross.

this was the form of C. on which St Andrew, the national saint of Neotland, suffered martyrdom. As the Sentish ensign, it is now blended with the C? of Nit Conroe in tba" l non lack.

Many very beautiful crosses exist in England, upon the points of gules of churches, on gravestones, ami in other situations, as also in heraldry. Among these, the ( ${ }^{\prime}$. most commonly sen is called the $\mathbb{E}$. cross lot. In this figure, as seen in the amexerl cent, the extrematies are intersected. so as to make several small crosses. When employed in ecelesiastical architecture, the figure is usually carved in a flow il or highly decorative style. When the C. crosslet is pointed at the lower extremity instead of loving crossed, it is in berahlry said to be fitchool, or , fitehou. It is of frequent use in blazon.

Sienctury, Boundary, or Monumental Crosses, as they are called, consist of an upright flat pillar or obelisk, covered with sculptured devices, and set in a socket level with the ground. Occasionally, they appear to have marked boumlaries, but more freefluently were moments over the graves of heroes, kings, bishops, \&e. In some instances, they probably marked the verge of a sanctuary. The alder of these crosses are said to be scandinavian or Danish, and such are known as litenic Crosses, the term rune simplifying a superstitions invocaton. We are told that the islam l of Tons st one time possessed :36" crosses, lat all are now destroyed or dispersed except once called st Marin's ('ross, standing in the mimes of the cathedral. It is a collat of conspact mica schist, If fore b high, 1 s inches lond, ant (i) inches then k, and is fixed in at prescal formed int of a massive lonely of real manat, allan, B frt high. The gramier market $\therefore$. cunsistal of a tull stome shaft, such as just desmoloch, hat instead of steps, it sparg from the centre of an inuminys sub-structare. This strac. ture was ciroular, hexazonal, or wetawnal, ami from 10 to 16 feet high. The thpe formed a platiorm, which was suroundel with an ornamenter stone
larapet, aud was reached liy a stair inside. The sides of the hilding wore decorated with pilasters, amd lure various berallic and other devices. Such were the crosses of blimburgh, and such is the renorated C: of Alerdeen, the sides of which, however, are open. Losing their religions eharacter, the Scuttish mariet-crusses were employed for royal and civic proclat mations, and as places where certain judicial writs wero executel. The general removal af these ancient and interesting structures has been often matter of lamentation. The oldest C. of Edinburgh, which was the seene of a number of incidents connected witn Scottish listory, stood in the centre of the High Street, nearly opposite the entrance to the Parliament Syuare. it mas removed in 1617, to make way for a royal pareant, the procession of James VI., on his first visit to lidinburch after his removal to Englamh. A new market- was then ereeted a short way further down the strect, un the south side. We give a sketch of this $(.$, which consisted of an octangular sub-structure 16 foct across, with a harndsume stone shaft of abont 20 feet in height; its removal in 1750, by the civie authorities, is indignantly refermel to ly suott in his poom of Mermion. Nince its removal, royal proclamations, \&e, are male on the site, which for these and other fimposes is technically the maket-C. of Edinhurgh. With a better :1preciation of objects of archatogical interest. than prevalled in the lsth e, the re-arection of the (:. has been recoutly agitated.

the C , a miracle readily determined whel wis the proper object of reverence. An order of friars, fonmed in honour of the lnvention of the Cross, and carrying in their hand a stati, on the top of which was a C ., receivel the name of Croisiers (Fr. crois, cross), cormpited into Grouched or Crulched Friars. They came to England in the 13th $\mathrm{c}_{\text {., }}$ and liad monasteries in London, Oxford, and Ryerrate. The festival of the Elevation of the Cross (luth September) commemorates its re-erection in Jernsalem by the Emperor Heraclins in 62s, after it Lad been carried away by the Persiaus.

CROSS, The Order of The, originally a spiritual orler of linighthoot, which sprang up in Palestine in the time of the Crusardes, and was then called the Bethlehernite Order. After the commencement of the 13 th c., the knights of this order adopted the momastic life, settling clicefly in Austria, Bohemia, Moraria, Poland, and silesia. Pope Gregory 1X. confirmed the order in 1328. Its prineipal seat is now in Bohemia, and its members generally hold ecelesiastical preferments or professorships in the nwiversity of 1'rague. They are elistingrished by a U. of red satin, with a six-pointed star under it, and are sometimes called Stellifini.

ClOSS. The Soutuern, the most conspienons constellation in thesouthernhemisphere, situatel near the Antaretic Circle, aud therefore never visiblo to our latitude. It consists of four loright stars, to which the fancy, aided loy (hristian associations, readily gives the crnciforn shape. The two britliant stars which wark the summit aud foot of the U. have nearly the same right ascension. The constellation, therefore, is almost perpendicnlar whem lassing the moridion, and these two stars act as pointers to the Antarctic pole.

CROSS, Tictorn. The peculiarities of this decoration, which was instituterl on the temmination of the Crimean eampaimn in 1556 , are, that it may be granted to a soldier of any rank, aud for a single act of valomr. The $C$. of the Legion of 1 Lonome, as was felt divims the Crimean campain, surved a purnose in the French arny which was served by none of our clecorations, and it was in mitation of it that the Victoria $O$. was foumded, with the inscription 'For Vabour,' and which can be given to none lut those who have perforncel, in presenee of the ernemys, some signal act of valour or devotion to theil eountry. The cenural listribution of the crosses earned in the 'rimean war towk

Victoria Cruse.
Mace in llyde lark on the soth June 185\%. The recipients were 6\% in number. The Vieterit Cross is in the form of a Malteso cross, formed from the cimuon captured at Tobasto[n]. In the contre is tho royal crown, sumbonted by the lion, and below, on a seroll, the words, 'For Falour.' 'The ribbon is blue for the navy, and red for the andy. On the claspare two hranches of lamel, and from it the eross hangs, sulpurted by th" initial "V.' The decoration is accomphaied ley a prosion of $x l 0$ a year.

## CROSSBHLL=CROSS-EXAMINATION.

claim or defence which could mot le maintained in the original suit.

CROSSBHIT, (Loxit), a family pringillide, mach rasombling bullfindhes, limets, \&c, except in the bill, whimh is altore ther singuter the twomalides-whinare rather long, thick at the base, aml much "urval -rossins cwh other at the points, when the bill is closiol. In different indiviluals, even of the satre species, the upper and lower mandibles are fonme varionsly directed to the right and left, This emformation was rashly characterised by builon as "an error and defect in mature, and a useless cleformity ;' whereas, it is an oumirablo adaptation to the wants and hatrits of the hints, and other peculiarities of their structure leantifully correspond with it-the linl being articulated to the head in such a mamer that the mandibles are capable not merely of vertical

Crossbill (Loxia curvirustret).
but of lateral motion, and nuseles of extraorimary power, in comparison with the size of the hiri, being provided for moving them. The result of all this is, that the crossbills readily olatain their principal fool, the seeds of firs and dines, hy tearo ing mp the cones. They loring the points of the mandibles toge ther-which they can do so as to piek口1) a very small seel-and insert them into the conc, when a powerfil lateral movement witens the opening quite sutficiently, ant the tongue, which terminates in a singular movable scoop, formen of a home articulated to the os hyoides, or ordinary bone of the tongue, is inserted to detach the secel. The power of the bill is such that it can be emphoyed in its lateral movements to tear wool to picces, and crossbills in confinement seen to take a mischievous pleasure in so employing it, and by this means, and pulling at wires, soon destroy any ordinary cage. An apple is cut to pieces almost in an instant, in orter that its seeds may be reabeled ; and flocks of these birds sometimes do great mischief in orchards. Only three species are known, all of which have been found in Britain, althourh only one, the common C . ( $L$, curvirostra) is of frequent occurrence. It sometimes occurs in considerable numbers, lat in most years is scarcely to be scen. It is a native of Lurope, Asia, and North America, dwelling chiefly in pime forests, and extendinit as far north as they do, not dreading the coldest cimates.

Crossbbow, See Arbalest, Afchers and A Echery.

## cross mrembing. Sce Brfeding.

CROSS BUNS, a small eake specially prepared for Gool Friday, and in many towns of Englant cried about the streets on the morning of that day as 'Itot-cross buns.' Bun, means simply a romel cale-properly, a lump, being from the same root as bumion, Ital. bugno, a bump or knob; allicel is the Gacl, bonnach, a eake, a bomoch: Good-Fritay buns
were aprontitcly marked with the cross, and hence the name, "lhe oryin of the practice is obschere.

Choss chosslat. Ser Crast.
CROASF, Anmma, a rentukable exprimenter
 Hills, sumersetshiee, June 17, 1781, was educaten at bristol and brasenose Collpge, Oxfort, and in 1 sha - Isia, settled on his paternal eatate, where lat began to devote himself to the study of andricity: Hapmening on one vecasion to examine a catron near bis residence, lfe fuam reason to conclume that the crystallisations on the walls and roof were fartially, at least, the chect of the opration of this subtle aroncy. In 1807, he commencel experiments with the riew of forming artificial crystals by electricity. Ine took home some of the water which dropped from the roun of the cave, and exposel it to the actim of a voltaic battery for ten clays, when he found crystals of carlonate of line forming on the nergative platinum wire. C's endeavours tu form crystals if various sonts were very successful. After Sio years of quict research, huring which perion the remained tutally unknown to the leamed workl, he oldained no less than 24 ninerals, crystals of guartz arragonite, carbmatus of lime, leal, and copler, besides mure than on rither artificial min+rals. Explaning his disenveries at the mectime held ly the British Assuciation fur the Alwancement of Nicience, at bristol in $180 \%$, he recuivel high praise from its most distinguished memhers. On this wecasion, he also expressed his belicf that every kind of mineral would yet he formed liy the ingenuity of man. lint his most startling discosery ocemren a for months after. While experimentinn with some hishly coustic solutioms, out of contact with atmuspheric air, there appeared, as if gradually growing from specks letween the pros of the voltaic circhit, certain animals of the genns acerus. C. nevrr affirmed that he had developel animal life out uif inorganic elements, hat simply that under cortain physical conditions he coud make acari appar, and not otherwise. The 'discovery' made a great noise at the time. The possibility of the fact was, of course, lenied by all those persons who 'take the high miore road,' and have made up, their minds as to what facts alone are lossible; lut Faraday declared that he han seen, during the same year, similar alpearanees in his won dectrical experiments. C. was accused of "impicty, and of beine 'a reviler of our holy religion,' ind although a very pious man, was actually compelled to defernd himself against such pitiable charges. it is humiliating tu state that, in spite of his defence, various honours to which he was justly entithel, were lust to $C$. in consequence of his discovers. C. also inventel a method of purifying sea-water by electricity, improved wines, spirits, and cilder ly the same process, and shewed that it might be usefully aprlied to regetation 1 Te died July 6 , 155.5. An excellent memoir of him was published by his widow (153.).

CRO'SS-EAAMINATION. The cxamination of a witness by the party against whom he was addnced. In England, the following are the princinal rules affectinit C.: 1, The witness may be cross-examined on the whole case, and not mercly on the points on which he had been examined in chief. 2. Leading questions may be put in cross-examination. 3. Irreleraut questions may often be put, but if
for the mere purpuse of impeaching the witness"s credit. they are inammissible. 4. For the furpose of impercheor the character of the witness, he may alwas fre asked whether he has been gillty of i irme, but he is nut always bomel to answer. 5. Evidenee may be lirought to contraliet the answer Liven an C... on relevant facts, lont not an irrelt. Fint, maless the irrelevant fact be the conviction of the witness of a felmy or misnlememour. 6 . A witness may be cross-examinet as to any previous statement made ly him relative to the trial (cxeept matter of mere opinion as to the morits of the (ase), ame evidence may afterwards be loweht to contralicet him. Sec Ebilenie.

CROSSOPODIA, a remis of ammelids letermind from maklines on the surface of Silmon slates. Nothing exhibisting structure has been abservedthe surface of the shate is mot eren darkencd ly the organisms, which the matimes shew to lave heen nereinfise worms of some six inches in length. The extraodinary lenorth, 'prolonlyy many yards, which was ascribed to thes ammal, has been shewn her Alexamter Diryson tu he fomment on a confusion of the looly with the track formed ly the passare of the creature thanterl a erisp rathor than a slimy mmi, the track having heen illed up witl dry lifown Thot, which gives it an aphearance and structure cliferent from those of the surounlinis matter.

CROTALA'RIA (Gr, botetom, a rattle), a gemas of plants of the natural order Loguminowe, sub-orider Popiliomarer, leriving its name from the inflated londs in which the serils rattle when ripe. Th, specios are momeroms; ammal, peremial, ami Shouling pants, natives of the wam pants of the world. Nany of them have lomes. stiaight, slemeter stems and branches, and some of these vield valuable fibre, partienlarly ('. juncod, the Suxs ( $1 . \mathrm{v}^{2}$ ), or Simn Itenj of lmbia, an anmal species the fitre of which is now an important article of commerce. JCemblpure llemp, alss an important filore, and regarkel as stronser than sum, is the prombee of S' temuifolie, a prommial specte about nime feest high, a mative of the sumth of laidia, which, when mowing in almmiant sproce, throws ont many hranches; but when sown thick, grows with hittle lranchinis. ( ${ }^{\prime}$. liakhir, which naturally grows in very ariti places, is also entivated in sinflu for its fibre; and that of $G$ refose is emplosed in the

parts of Ancrica, inhabiting sawamas and open pastures, partieularly those which are occupied by eattle or horses, and feeding chictly on insects, partly also on lemries. It uses the sharp ritge of the lill in opening out earth, rlung, \&c., in search of insect prey, It often perches in the laacks of horses or eattle, to feed on ticks, and may he seen elinging to a eow's tail; the important service which it renders being apparently well appreciated.

CROUP, a severe and fatal disease of infants, known from a remote period, luat first scicontifically described by Dr Francis Home in 1765, as a suffucative affection of the breathing, depmeling upon the formation of a false membrane or fibrimus deposit on the macous membrane of the wind pipe or Larynx (q. v.). It is proper to remark that the intlammatory disease nesuriberl by dome has been frecuently cenfomided with a purely spasmodic affection of the larynn, the asthma of Millar, or hermgismus stritutus of Dr Mason Good; anl also with Diphtheria ( $q$. v.), in which a false membrane is formed on the pharynx and palate, as well as in the larym. C., in the more restricted sense, berins with symptoms resentiling (atarh ( 1.7 . ), but liffering in the greater degree of feverisluness and hoarseness. In a short time, the respiration becomes diticult and noisy; a very peculiar hissiner somd is heard accompanyiag the drawing of cach breath; the enugh is barsh and brassy; the countenance is injectol, the expression very feverish aml anxions, the voice entirely lost, or very much alterel. This state is soon followed by nene of suffination, unless the little patient is reliever by expectoration, which, however, frequently takes place in the midst of vomiting or coughing, a quantity of memhranous shreds being irought up from the wintpipe along with glairy mucis, amil sometimes streaksof lloon, In the worst cases, the spasms of ineffectual coughing, and the constantly increasing obstruction to the breathing, are most painful to witness; and a leriod of tossing, extreme suffering, and anxicty is succeeded either hy gradual insensibility; or ly convulsions, which are very soon followerl by death. True $\because$. is marely seen after the age of pubcry, and is rathry nommon before the termination of the first year of life. It may oceur, however, at any are, and has essentially the same charaters as are abose deseribed. It is supposel to be due in some measure to Endemic ( 1. . v.), and fartly alse
tor bindenic ( (f. v.) causis. It is most common in colld and moist climatus and sorasenis, and in bows lying, hut expowi situations. The variations in its prevalrnee, howswre are by no means fully explinid. The treatment of 1 Prequres to le vary atctue and ducidel, and yot free from rashness. In casisus of liashly inflammatory type, and in robust Chikim, it may la' [rosur to take blowl from the arm, or to phace ne or mare leches (averaline to the a we of the childif wor the top of the liveast bome. In remetic shaphal itho be given as som as possiblh, composed of a full dose of tartaremetic or of ipera. cuanha, or loth toge ther. Some prefer sulphate of copper giveli in reprated duses: in America, a [mfernce is given to alum and homey mixel into a 1nister, and given in teaspoonful doses. The an tic may be repeated, if necessary, every two or thren hours, and the chilh should at intervals be placed in the warm lath. It meeds harlly be alded that medical advice slould he proenred without a mument's delay, whenever it is within reach, for the disease is ons of extreme lianger, and almost all the most effective remedies require experionced hamls fur their safe aduinistration. In extreme cases, Tracheotomy (4.v.) has been resorted to with succerss.
ClioW (forcus), a genus of lirds, the type of the family Corvide (4. v.). The largest species of this Henns is the Raven ( $q . v$. ). The Ionk ( $q$. v.) also Belongs to it. Besides these and the Jackdaw (q. v.), there are two other slecies fomme in Britain, the ('ommos or Ehmetos C. (C'eomon), amit the Fiovston C. ar lloomed (: ( $C$ comic). They liffer from one another chitfly in eolour, the C'arrim $C$. being black, the Ilooted C. gray, with llack head, throat, wings, and tail. The Hoordel C. is also rather larger than the Carrion (., which, in size, nearly agrees with the rook, lut which may readily leo distinguishel from that speeics by having the base of the bill and the יuper part if the throat not nakich and rough, lout closely featherel. The name Hooled $a_{\text {a }}$ is derived from the alpearance of the black heal, contrastel with the gray body, but in some parts of scotland is, withont any show of reason, popularly transferrel to the Carrion C., under the form IIoody. Both of these species have habits mueh more resembling these of the raven than of the rook; they selitom or never associate in flocks, and not only prefer carrion to worms, insects, or vegetalle from, but watell aul attack sery weak animals, such as youncr lambs. On this account, a premmen is in many places given for their destruction, aml gamekeeprer relentlessly pursue them on account of their robbing nests, from which they take either the "ggs or the help. less young. Their own nests are kult in trees, or if these are not to be foum, among high rocks. They both necasionally freiuent the sea-coast, feeding on shell-fish, \& : Poth are willely distribnted over Europe and the northern parts of Asia.-The C. of North America (". Americemus) is very similar to the Garrion C'. . lut rather smaller, and, after the lorecting seasm is own, congregates into great Hocks: it is also partially migratory, ureat numbers from the more northerly parts moving to the south on the aproach of winter. Its habits are otherwise intermeatate between those of the C'arrion C. and the rook. - The TisII © ( (C.ossifrapus) frequents the coasts and southern rivers of the Cniterl States, feeding chiefly on fish, which it catches with great dexterity. It also sometimes assails gulls, and compels them to disgorge their prey.-The Jabbering ( $\because(!$. Jumatonsis) of the Blue Monntains of Jamaica is renarkable for the resemblance of its voice to human speech. which some of the other ispecies of this guas, as the raven, it is well known,

## CROWBERRY-CROWN.

can be taught to imitate. Sir J. E. Tennent gives an interesting account of the small glossy $\mathcal{C}$. of Ceylon (C. splendens), which frequents the towns, feeding on offal, and boldly entering rooms through open windows, to snatch some morsel from the dinner-table. Habits of pilfering are more or less prevalent among the different species of erow. The accompanying eut of the leads of the raven (fig. I) and the rook (fig. 2) illustrates well the

prevalent characters of the lill in this genus, shewing also in the raven the bristles which, as in most of the species, surround its base, but which are wanting in the rook; and contrasting the greater strength of neck, head, and bill which helongs to the more camivorous as compared with the more frugivorous species.-The Red-LEGGED C. is the Chough (q. v.) - The mame Carrion C. is given in America to the Black Tulture. See Vulture.-The Piping C. of New South Wales is a Baritail (y. v.).

CRO'W BERRY, or CRAKEBERRY (Empetrum nigrum), a small procumbent shmul, of the natural order Empetracea, a native of the northern parts of the world, abundant in the moors of Scotland aud the north of England. The order consists of a few heath-bke shrubs, which, however, are regarded as having a botmical affinity to Suphorbiacece (Hpurges, \&e.), with small unisexual llowers in the axils of the leaves, the fruit a small berry seated in the persistent calyx. The berries of the $C$. are nearly black, surroumd the branches in crowded clusters, and each contain 6-9 bony seeds and a watery reidulous juice, which is sometimes felt to bo not unrefreshines; but they are generally little estermed. A fermented or vinous lignor is prepared from them in some northern $b$, fruit cut open; $c$, fower.
the preparation of an acidulous liquor, which is used as a drink in fevers.

## CRO'WFOOT. See Ranunculus.

CRO'WLAND, or CROYLAND, an ancient town in the south of Lincolnshire, on the Welland, in a low flat district in the Fens, 48 miles south-south. east of Lincoln. There once existed here a large abbey, built about 1200 , and there still exist the remains of a chorel foumded by King Ethelwald in 716. At the confluence of the Welland and the Nene, there is a curious triangular bridge, built probably in the 14 th $c$. on the site of an older one ereeted about 860 . Ingulfus, the historian, was abbot of Croyland. Pop. $\triangle 166$.

CROWN (Lat. corona, Wel, crwn, and Gael. cruinm, round). Crowns were originally garlands of leaves; and in this form they have probably been used as an ornament for the head by almost every people. They were much used by both the classical nations on joyous and on solemn occasions. Among the Greeks, the C. (stephanos) was sometimes used as an emblem of office, as in the case of the arehons; sometimes as an ornament for the heads of the victors in the pablic games; and sometimes as a mark of distinction for citizens who had merited well of their coumtry. Crowns of the latter class were made at first of twigs of lavrel, but latterly of gold. The Fomans made use of crowns to a greater extent than the Greeks, chiefly as rewards for valour. The most highly prized was the Corona obsidionalis, which was bestowed by a beleaguered garrison or army on the general who reseued them. It was made of grass or wild-flowers, gathered from the place which had been enclosed by the eneny. Next in order was the Civic $C$., a garland of oak-leaves and acorns, which was given as a reward to any soldier who had saved the life of a Toman citizen in battle. For the soldier who wore it, a place next to the senators was reserved at the public spectacles, and both the senate and the assemblage rose up on his entrance.

Not only he, but his father and paternal grandfather were free from all public burdens; and the person whose life he had saval was bound ever after to shew him the chaty which a son owes to a father. The civic $($. is sometimes used in heraldry.

Another of the lioman crowns was the Corona muralis, which was bestowed on him who first scald the wall of a lesieged city. It was a golden ring summomed with turets or battlements. It is often used in modern heraldy.

The Corona triumphalis, which was of tlyee kinds, was bestowed upon a general when le obtained a triumph.

But there was a totally different class of crowns, which were mot lonorary, lut emblematical, and which were not regnlated by law, like tho former ones, lut by custoni. Of these, the most important were: 1. The Corome sacerdotalis, worm liy tho priests ami hystambers when engaged in sacrifice, with the exerption of the pontifia maximus. It was sometimes of olise leaves, sometimes of ears of com, and sometimes of gold. 2. Corona funcbris or
sepulchralis, with which tho dead was crowned, a custon which prevailed both among tho [irerks and Jomans. A law of the 'Jwolve Tribles provinod that if any one laul been crowned while: living, the C. should be placed on his hand when ciarierl out te burial. Crowns were also plamed on the bier, and seattered from the windows under which tho procession passed. In firome these crowns wore commonly of parsley. B. Aoront commintis. The ruston of weamis wreathe on festive oceasions, which, like most of the lioman customs, was drvivel from Greece, is supposed to have originater in the habit of tying a woollen fillot round the head, to mitigate the effocts of intoxication. As luxury incratsed, they wore made of such tlowers and slumbs as were supposed to prevent intoxication, roses, violets, nyrtle, ivy, mal even parsley. of. ('orwa moptialis, or bridal-wreath, made of thowers plucked by the luide herself, and mot bought, which was of bad omen. Amongst the liomans, it was nuade of verbena. 5. Comone matuliter, a chaplet suspumded over the door of the vostibule in which a chilel was born.

Several other classical crowns are mentioned in the very elaborate artiule on the subject in Smith's Dictionary, to which we lave been indubted for much of the preceding information.

As the cmblem of sovereignty in modna Enope, the C. was borrowed rather from the Diarlem ( $1 . v$. ), than the crowns of antiquity. This decoration was originally Oriental. Alcxander the Great alopterd it from the kings of Persia ; and Antony assunned it during his luxurious intercourse with Cleopatra. According to some, its adoption for the gods originated in the fillet, which was assigned to Bacchus for the purpose mentioned as that which led to the use of the convivial crown. In morlern states, erowns were of very varions forms, till heralds devised a regular series of them to mark the various gradlations of sovereignty, from that of the emperor down to what are now called the coronets of counts and barons. The pope also had his triple crown. See Tiara. So entirely was the $C$. regarded as the symbol of sovereignty, that the word came often to le used as synonymous with the monarchy-a sense in which we still speak of the C. of England, and the domains and possessions of the crown.

The erowns of kings and emperors are closed above, whilst the coronet of a woble is merely an open circlet surrounding the head; hence, to close the $C$. has been the ambition of princes desirous of shaking off the authority of feudal superiors, and assuming a complete sovercisnty.

The royal C. of Great Britain is a circle of gold enriched with stones and pearls, and heightened with four crosses pattée, and four fleurs-de-lis alternately. From these rise four arch-diadems, adorned with pearls, which close under a monnd, ensigned with a cross pattée. The C. used at the coronation of Queen Victoria was adorned in accordance with the taste of the present time.

The coronet of the Prince of Wales is a circle of gold, set round with crosses pattee and fleurs-de-his, but has only one arch, decorated with pearls, sur: mounted with a monnd and cross, and bordered with ermine. In addition to his coronet, the Prince of Wales has a cognizance consisting of three ostrich feathers, argent, quilled or, enfiled with a prince's coronet of the last, with an escrol azure, whereon are the German words Ich dien (l serve). For the traditionary origin of this badge, see Wales, Prince of.

The younger sons and brothers of the sovereign wear as coronct a circle of gold, bordered ermine, beightened with Henrs-de-lis, crosses pattée, and strawberry leares alternately. Nephews of the

Bnod-royal have strawberry leaves on thear coronets, wheqe the sons and brothers lave fleurs-delis. J'rincesses-myal litwe a eirche if gold, bordered with ermine, and leightened with crosses pattie, fleurs-de-lis, and strawbrry Iaves alternately. For the commets of the dillerent orders of nobility, see thair titles.
fras Crown is a torn ,ften rmployal to signify the state, aml the matters mular control of the excentive autlority. Thas, in the interests of the state there are C. ministers, C. lawyers, C afficers, C. Kands, \&e- - lloe tern, in no instance, latin's mny surcial councetion with the sovercigu persenally. In Sootlami, certain lish crimes are technically called Pleas of the Crown. These are four in momber-murder, robbery, rape, and wilul fire-ratisins-and fall within tle jarisoliction of the: High Court of . Iusticiary. Likewise, in Scotlami, there is a functionary styled C. agent. Hu is a practising law-arent or solicitor, who, under the Lord Advo. cate and his deputes, takes charue of criminal proceedings. Ilis duty is to receive from tha. procurators-fiscal of the different counties the precognitions which they lave taken, and to lay these brecornitions before the laweres for the crown, that they may determine whether there is grommel sufficient to call for a prosecution. He also expedes indictments and criminal letters, and otherwise discharges the duties of an acent in proparing and assisting in the conduct of trials hefore the Hish Conart of Justiciary, which axe generally superintended or conducterl by the Solicitor-general. The appointment of the C. A. is with the Jord Advocate, and ceases with the administration.

CROWN DEBTS. It is a progative of the crown to take precedence of all other creditors, and in England, to recover its delots by a summary process ealled an extent. By 33 ILenry VIII. c. 39, this preference is given over all creditors who have not obtained judgment for their debts lefore the commencement of the crown's process; and the act 6 Anne, c. 26 , extended the law of England in this respect to Scotiand. The rule in Scotland, however, was limited to movable or personal property, and the crown has no privilege over a subject in a competition for heritage. It olstains, how. ever, as opposed to the landlind's I Iypothee ( $\mathrm{i} . \mathrm{v}_{\mathrm{y}}$ ). Nercantile sequestration has no effect arainst the erown. The sanctuary of Holyrool House affords no protection to the kingr's dellur. See ExTENT, Exchequer.

## CROWN IMPE'RIAL. See Fritillafy.

CROWN LANDS. The demesne lands of the crown are now contracted within narrow limits, haviug been almost entirely granted away to subjects. Fing William III. so impoverished the crown in this manner, that an act was passed, 1 Anne, c. 7, s. 5, the effect of which and of subsequent statutes is, that all grants or leases from the crown of royal manors, or other possessions connected with land, for a leriod exceeding 31 years, are void. At a much farlier period ( $145 \overline{5}$, c. 4t), a Scottish statute hal rendered the consent of marliament necessary to the alienation of the froberty of the crown; hut neither it, nor the subsequent statutes, which were passed with a sumilar object, succecded in checking the practicc. The superintendence of such property as still belongs to the crown is now vested in commissioners appointed for the purpose, called the Commissioners of Woods, Forests, and Land Revenues. See Woods and Forests.

CROWN POINT, a post village im the state of New York, on the west side of Jake Champlain, about 75 miles north of Albany. Being within the
basin of the st Lawrence, it formed part of French Canala. With the view of briding the English on the sonth, it was male the site of a fort fanms in the American war, hut of which the rinus only now remain. The immediate neighbourhool is now a township of alout $\mathbf{Q} 500$ inbabitants.
rROWY SOLIClTOR, the solicitor to the Treasury, who, in state prosecntions in England, acts as solicitor for the crown in preparing the prosecution. In Ireland, there are erown solicitors attached to each circuit, whose duties correspoml in sume olegree to thuse of the I'rocurators-fiscal (q. v.) and Crown Agrat in Scotlani. See 'Eows. Th England, there are no analogous wficers, and prosecutions are eonsequently conducted by solicitors apminted either ly the parish, or by private parties lomal over by the macistrates to prosecute. lint in cases of great inuortance to the publie, such as unusual or monstrous crimes, it is of frequent occurrnce that the Solicitor to the Treaswy takes charge of the case and iustructs comsel.

CROWN-WORK, in Fortification, is formed to strengthen a weak front, or to ncoupy ground which mint facilitate the enrmy's ererations. It consists of two faces inclinad to cach other at an angle, with a hastion in the midale, and half-hastions at the two ends; and it is cunnectel with the main bouly

of the work by two lome sities. One form of $C^{\prime}$, is shewn in the annexal cut, where linN1's is the C., in front of and protecting the ravolin O. lath of these wonks are entirely beyonl the man ditel of the plac", lut each has also a ditch of its own.

CleOW'SFEET, in Siege Operations. soe Cabtheor.
CROW-STONE, the top stone of the gablerm? of a building. See Comban Sters.
('ROS'ION (Fr, sroie dune, chalk-hill), a town in the north-cast of Siurser, on the Lombon and brighton lailway, $10 \frac{1}{2}$ miles sonth of Lumdon lirider. It lies on the edtre of the chalk and flantio "lay, near the Pansted Thwns, at the source of the Wiandle. The chiof strect, a mile lung, fomms part of the main raml to brightom. The prin"ipal trabe is in cerm. Tha" fletobur fair is also
 of 'anterlury hal a palace here till 17,0. This patiach is now at fictory, and the summer seat of the archbuseres is mow at Aldinetom, I miles mast

 spoines Shmit a mile from $(\therefore$, is Addiscombe

Honse, at one time the residence of the first Earl of Liverpool, hut purchased by the East India Company in 1sin. When enlarged by other buildings, it leeame a Military Acalemy, at which cadets were educated for the Artillery and Engineer services of the Compray. At a later clate, the Tnfantry calcts also received their professional education there. In 1855, when the government of India was transferral from the Company to the Crown, Addiscomle Academy was transferred in like manner: It is now called the Thyyal India Military 'oollege. It was in 1860 divided into two portions, a 'Sinior ur Scientific Deprartment,' and a 'Junior or Infantry benarment," both open to officers intemind for the India service. $C$. has one of the linest Cothie churelees in the county.
©CROZETV IRLANDS a voleanic group to the south of the Indian Ocen, lie letween Korguelen's Land on the east and I'rince Edward's 1slands on the west, almut midway letween I'atagonia and New Zoaland. The most easterly link of the chain is in lat. $46^{\circ}-27^{\prime}$ S. and long. $52^{\circ} 14^{\prime} \mathrm{E}$.
 same genus with the Carl (r.v.) froun which it diflers in the want of larbules at the mouth, in the much greater depith of lody, and in the alnost square tail. 1t attains a considerable size. It inhabits lakes. ponds, and slowly flowing rivers, in the north of Europe and of Asia. It is callen Kirmss in sweden. It exists in the Thames, although race, amd is called the Gramon (itp, but las perliaps been introluced. It is an exc. Hent article of food. The introduction of the C. into some of the waters of the northern parts of Britain seems particularly desirable.

CRU'CIDLES are vessels em. ployel for the heating and fusing of glass, metallic ores, \&e., and are
 generally made of materials capable of resisting high temperatures, such as fire-clay, black-leal, porcelain, platinum, and silver.

CRITCHFERE (Lat. eross-earrying), an important natural order of exogenons plants. including abont 1601 known species, anil correspouding with the class Tefretynamio of the Linnean system. See Botiny. The ilowers lave a calyx of four sepals, which fall off after flowering; ant a corolla of four petals, which are placed in the form of a crossWhence the name (:-and alternate with the sepals. There are six stamens; fome long ones in opposite pairs, and two short ones lnetween the pairs of long ones. The ovary is sumerior, and there are two stimmas. 'The fruit is cither' long and poollike (a silique), or a short and rumndish pouch (silicule); on". collod, or (usually) spuriously two celled, ly the prarictal placontet (sce Poweata) moting in the miduln, and forming a kind of Dissepiment (ef-v.) : and contains cithor one seed, ur many in at single row. Linnas divided his class Tetrmbmemian into the orrows silliqueser and sitiontese, aceorting to the form of the fruit, and thesp maty alson lne regated as forming sulathens of this batural outor; leat amother hivision hats mome recently hern alopted, fommide on the charactere of the Cotyle dons (1. v.), and the maner in which the radicle is foldel upon them (condaions rerambent, incumbent, or condupliceti). The gencral character of the orier is antiscorloutic and stimulant, with more or less acridity. It contains many plants cextonsively eultivatel fir the fons] of man :mind of doneste animals, or valuable in

## CRUCIFIK-CRUIKSHANK.

l'leasure, \&c. The dye-stuff ealled Woul is powduted ly a plant of this order. It includes also a number of garden-flowers hichly estermad for their beanty and fragrances, as W:dflowner, Nock, Loceket. \&e. The pungeney and arridity of the 1 . serms to depend on a volatile oil, or on dillerent volathle sils of very similar characta, presut in very warions degree in different specion. of in the same spereins monder different eireunstances, and in different parts of the sam" plant. 'fhis diversity is very woll illustrated in the common turnip; in the differnt qualities of the root, ass to swectuess and arridity, in different soils or seasons, and in the difference between the flesh and the rimi. The seeds of the C. contain a fixpl oil, which is extracted from some (hare, Colza, in Europer ; Mpognam setiman amd Erysianun perfoliatum in Japan), to be nsed as a lampoil and in the arts, and the oll-wake is raluable fen feceling cattle. The phants of this order helons mostly to the temperate parts of the work, and particularly abound in Furne. Comparatively few are foum within the tropics.

CRU'CIFIX (Lat. char, the cross, and figo, I fix), a cross with the effigy of Chmist fixerl to it. The mineipal C. in Toman Catholic churches stands in the centre of the high-altar. It overtops the tapers, and is only removed at the devation of the host. In well-appointed chorchess the altar crneifix is generally either of gold or silver. Crucifixes are used in Lutheran chmeches, and in l'russia they are often made of Herlin iron. The C first begin to take the place of the plain cross in the time of Constantine, lut it was never pulticly acknowledged by the Greek Clureh, and did not come into general use in the Last till towards the

ent of the sth century. It was not till the Carlo. vingian age that it became general the Latin Church. On the earlier erucifixes, C'mist is repre. sented as alive, with epen eyes, and generally clat, and fastened with four, not three nails. We uller a representation of an ancient fom of C., with the body of Christ elothed, and four mails as fastenings, also the slory or nimbus romm the head. - Fairholt's Dictionary of Torms of 1 trt. In later times, all these cirenm. stances varicd. Christ was often represented as dead, naked, except a eloth round the loins, and fastened with three nails; i. e., the two feet fastened together by one nail. The earlier artists usually represented the figure of Christ as haggard, aml his comutenance as sorrowfil in the last dergee; lut latterly the custom was introdnced of represuntiny him as the inleal of human beanty, amb of throwing into his comntenance an expression of rapture and beavenly joy, See Cross.

CRETDEN, Alectioer, was born at Aberlecn, 31 st May 1700 , and educated at Marisehal College. with a view to the eburch, lont havimg exhibited decided symptoms of insanity, he was for some time placed in confinement. On his release, le left

CRU1RSFINK, Gicorge, the most celepraterl of living English caricaturists, was horn in Limdon about 1792. His father was a mative of ithordeenshire, and the son of a person who hal fought for I'rince ('harles Stuart at C'nlloden. ('. at first thourht of the stage as a profession ; but some of his sketches laving come undur the notice of a publisher, he was induecd to engage in the illustration of children's bouks and songs. When about twenty years of age, a publication, callad The Srowre, afforderl scope for the disulay of his satiric genius, and from that time forth he has contimued to pursue with remarkable suceess this his true vein. His illustrations for Mr William Hone"s pulitical squibs and bumplets attracted much attention, and sent some of them through no less than fifty editions. lout these political caricatures, many of which were personal, were not altogether to U'"s taste. For, moled, in this narrow warty field did he fimd weres: emomerh for the full exhilation of his rich fund of hamoner and atepth of moral sarcasm. He consequently abandoned this style alout 1s2d. In I'oints of IIumons. und the designs for Grimm's Giromen Tertis. Tom Thumh, Peter Schlemihl, I'ande and dmly, M! Nketrhbook, Los, Glieq Thist, and the éomir Almanke, his comic genins first fomul ampla manifestatinn ; while in his simuluy in London, his Gim-shop, The Ipas Trae, anil "specially" Thes Bottle, he shewed himself a mome teacher possessed of a grim 1 Logarthian earmestness and force. The Dottle consisted of a series of eight Large-sized plates representing the varims stanes in a dmukard's career : and throngh the instrmmentality of the temperance societies. as well as on account of its own merits, the work has lanl inn enommons circulation. Latterily, (. has devoted himself to oilmainting; and in his pictures. " Dressing for the bay, 'A limaway K゙muck," Tam O'Shanter,' and ' Disturling the Congregation,' he combines humomr and artistic skill. It is pleasant to add regarding a man of true genius, that his personal character has gained fur him the respect and affection
of all who know him-s' in wit a man, simplicity a chide.'

CRUI'SER is a small war-ressel, employed chiefly in watching an enemy by sailing about in a suspected latitude, or in any other defined portion of sea.

CRUITHNE' (Lat. Cruithnii, Cruthini), the name given, from the 6th to the 9 th c., to a people who immbited the southern half of the county of Autrim, and the greater part of the county of Down, and at one time established themselves also in the connty of Meath, in Ireland. They were otherwise called Dalaradians, and their country, Dalaradia. Their name of $\mathbf{C}$. is snpposed to be derived from the Celtic cruit, colour, and to have been arplied to them hecause they painted or tattooed their skins. It is the name by which the Irish called the Piets of Britain, of whom, indeed, the Irish C. are believed to have been a branch. See Dilimadia and Picts.

CRUJVES ASD ZAIRES are contrivances erected upon rivers in Scotland for the purpose of eatching salmon. They are of great antiquity, and consisted of a 'kind of hedge formed by stakes driven into the ground, the interstices being filled with brush, and the mode of capturing salmon being similar to those employed by bag and stake nets;' the earliest statute now in furce, the 11th of the first parliament of James J. (1424), heing entitled, 'Of Cruives, Zaires, and Satterdaies Slop: This act is interpreted by 1477 , c.73, 'Anent cruives.' and both acts refer to an 'old statute male by Kimg David,' requiring that "ilk heck of the foresaidis cruves be three inch wide.' The existing arrangement, by which the stakes or leeks which prevent the passage of the larger fish must lie so far apart as to permit the young salnun or fry to pass through freely, is thus as old as the time of the great founder of our Scottish monasteries and catheirals. The Saturday's slop or opening is effected by drawing up the hecks to the height of an ell from the hottom of the river, in which position they must remain from Saturday evening at sunset till Monday morning at sunrise. C. and Z. are prohibited in those parts of a river in which the tide ebbs and flows, and it is proposed to abolish them entirely ly a bill now (186t) before parliament. See Salmon-fisinng, state-nets.

CRUSADES is the name given to the religions wars carried on during the midule ages between the Christian nations of the West anil the Mohammedans. The first of these was madertaken simply to vindicate the right of Cluristian pilgrims to visit the Holy Sepulchre. On the conquest of Palestine, howerer, the ohject of the C. changed, or at least eularget, and the efforts of the subsequent crusaders were directed to the rescue of the whole land from the Saracens, who had repossessed themselves of it. From an carly period in the history of the Chureh, it was consibered a pions act to make a pilurimage to the Holy Sepulchre, and to visit the varions sperts which the Saviour had consecrated hy his presence. Whan Palestine was eonguered ly the Arads in the 7the co, that fierce hut gencrous pende respectard the religious spirit of the pilgrims, and :lloweal them to build a church and a hospital in Jorusalum. Under the Fatimides of Egypt, who rompural Syria abont 980 A. D., the pusition hoth If the native 1 hristian resilents and of the pilgrims berame less favomalle ; hat the subjuation of the comutry, in 1065, hy brutal hordes of Seljuk Turks from itic "aucasus ramerea it intolerahle. These harbarians, bat recontly ronverted to Mohammandasm, were marly is ignorant of tho Koran as of the seripturs. They hardly knew their tollowereligionists, and aro said to have wreaked
their vengeance on the Mussulmans of Syria, as well as on the Christians. The news of their atrocities produced a deep sensation over the whole of Christendom. The first to take alarm were, baturally enough, the Byzantine monarchs. In 1073, the Greek emperor, Manuel VII., sent to supplicate the assistance of the great pope, Gregory VII., against the Turks, accompanying his petition with many expressions of profoumd respect for his Holiness and the Latin Church. Gregory-who beheld in the supplication of Mannel a grand opportunity for realising the Catholic unity of Christendom-cordially responden? ; lut circumstances prevented him from ever carying the vast designs which he entertained into execution, and the idea of a crusade died gradually away. It was, however, revived by his successor, Urlan II., an able and humane man, whose sympathies were kindled by the burning zeal of Peter the Hermit, a native of Amiens, in France, who had made a pilgrimage to the Moly Land, witnessed the cruelties perpetrated by the Turks, and was now traversing Europe, preaching every. where to crowds in the open air, and producing the most extraordinary enthusiasm by his impassioned descriptions of how pilgrims were murdered, robbed, or beaten, how shrines and holy places were desecrated, and how nothing but greed restrained the rufian Turks (who made the Christians pay heary taxes for their visits to Jcrusalem) from destroying the Holy Sepulchre, and extirpating every restige of Christianity in the land. As soon as the feelings of Europe had been snfficiently heated, Urban openly took up the question. Two councils were held in 1095. At the second, held at Clermont, in France, a crusade was definitely resolved ou. The pope himself delivered a stiring address to a vast multitude of clergy and laymen, and as he proceeded, the pent-up emotions of the crowd burst forth, and cries of Deus vult (God wills it) rose simultaneonsly from the whole audience. These words, Deus rult, by the injunction of Urban, were made the war-cry of the enterprise, and every one that embarked in it wore, as a badge, the sign of the cross; hence the name Crusald (Fr. croisale, from Lat. crux, a cross).
First Crusade.-From all parts of Europe, thonsauds upou thousands huried at the summons of the pope to engage in the holy war. 'The most distant islands and savage countrics,' says William of Nalmeshury, 'were inspired with this ardent passion. The Welshman left his hunting, the Scotchman his fellowship with vermin, the Dane his drinking-party, the Norwegian his raw fish.' It is said that in the spring of 1096 not less than $6.000,000$ souls were in motion towards Palestine. This, however, must be a huge exaggeration. What we do know pmsitively is, that previons to the setting out of the great hosts of European chivalry, four armies-if disorderly and anarchic multitudes, the mere dregs and refuse of Christendom, descre that name-amounting in all to 975,000 persons, had departed for Pillestine. The first consistel of 80,100 foot, and was commanded by a burgundian scutleman, Walter the Penuyless. It marched through Innuary, but was cut to pieces by the natives of Budgaia, mily a few, among whom was Walter himself, escaping to Constantinople. The second, cosisisting of 40,000 men, women, and chiklen, was led by Pcter the Ilermit. It followed the same ronte as its predecessor, and reached Constantinophe greatly raducel. Here the two united, crossud the lhasprus, and were utterly defeated by the Turks at Nice, whe capital of Bitlyynia. A third rxpedtion of a similar kinsl, composed of 15,000 Gumans, leal ly a pricst named Gottgchatk, was slanghtered or dispresed in thungary; which also proved the grave of the fourth, in terrible horde,
consisting of about 200,000 wretches from France, England, Flinders, aud Lorraine, who had swejt along through Germany, eommitting lorrible ravages, especially against the $J$ wws, whom they mutdered without mercy. Nou", lowever, the real erusulers made their appearanes: the gentry, the yeonaniry, and the serfs of feudal Jurope, mater chices of the first rank and renown. Six armies sppeared in the fiell, marehing separately, ant at "onsiderable intervals of time. Their respective leaters were Godfrey of Ponillon, I ukic of Lormine ; Ilugh the Great, Count of Vermandois, and brother of Philipre, king of France ; Robert Curthose, Dhake of Normanly, the son of Willian the Conqueror ; Count liobert of Flanders; Bohemond, Prince of 'Tarentum, son of the famous finiscard, under whom was 'lancred, the favourite hero of all the historians of the elusule ; and lastly, Count laymond of Toulouse. Tho jlace of rendezvons was Constantinople. The Greek emperor, Alexins, afrid that so magniticent a lost-there were in all not less than 600,000 men, exclusive of women and priests-might be indueed to conquer lands for themselecs, cajoled all the leaders, excepting Tancred and Count liaymondinto solemnly acknowledging themselves his liege. men. After some time slient in feasting, the crisaders crossed into Asia Mlinor (aecompanied by the unfortunate Peter the Hermit). Here their tirst step was the siege and capture of Niee, the capital of Sultan Sohman, 24th June 1097. This monarch was also defeated by Bohemond, Tanered, and Godfrey, at Dorylæum. Baldwin, bother of Godfrey, now crossed into Mesopotamia, where he obtained the principality of Elessa. After some time, the crusaders reached Syria, and lairl siege to Antioch. For seven months the eity held out, and the ranks of the besiegers were fearfully thinned by famine and diseasc. Many even brave warriors lost heart, and began to desert. Nelancholy to relate, among the list of cowards was the poor enthusiast who had planned the enterprise. Peter was aetually several miles on his way home when he was overtaken by the soldiers of Tancred, and bronght back to undergo a publie reprimand. At length, on the Sd of June 1098, Antioch was taken, and the inhabitants were massacred by the infuriated crusaders, who were in their thrn besieged by au army of 200,000 Mohammedans sent by the Persian sultan. Ovee more famine and jestilence did their deadly work. Multitudes also deserted, and eseaping over the walls, carried the news of the sarl condition of the Christians back to Europe But again rietory erowned the efforts of the besieged. On the 2sth Jume 109S, the Mohammedans were utterly routed, and the way to Jerusalem opeued. It was on a bright summer morning (1099) that 40,000 crusaders, the miserable remnant of that vast array which two years before had laid siege to Nice, obtained their first glimpse of Jerusalem. The emotion was intense, the seene sublime. On the I5th of July, after a siege of rather more than five weeks, the grand object of the expedition was realised. Jerusalen was delivered from the hands of the infidel. Eight days after the capture of the city, Godfrey of Bouillon was manimonsly elected king of Jernsalem. His kinglom, at first comprising little more than the mere city of Jerusalem, was gradually extended by eonquest until it inchuded the whole of Palestine. A language resembling Norman Freneh was established, a code of feudal laws drawn up-Terusalem was ereeted into a patriarchate, and Bethlehem into a bishopric. The best part of Asia Minor was restored to the Greek empire, while Bohemond became Irinee of Antioch. For nearly fifty years, the three Latin principalities or Lingdoms of the East-Edessa, Antiveh, aud

Jernsalem-not only maintaincl themselves against the attacles of the Dolianmedans of Eqyet and Syria, lout greatly incoosed in size, power, ame woaldh. At Jerusalen wre fommaled the two famons ordiors of the Kruights Ilusputallers of St John and the Kinights 'T'emplarm.

Sccome Crusale.-In $11 \cdot 1$, the principality of lidessa was confuered by the limir of Mosul, and the Christians Manghterel. His son, Nouredilin, ind vancerl to destroy the Jatin kingrlons of Syria and l'alestine. lurope once more trembled with excitement. A reeond crusade was preached by the famons St Bemard, Abbot of Clairvanx, in Clamplagne; and early in 1147 two enormons armies, wader the command of Louis VII., king of france, and Comrad III., emperor of (xermany, marehed for tho 1 loly Land. Their united numbers were estimated at $1,200,000$ fighting-men. The experlition, nevertheless, provel it total failure. The Greek emperor, Danuel Comnenus, was lostile; and through the treachery of his emissaries, the arny of Conrad was all but destroyed by tho Turks near Ieonium, while that of Louis was wreeked in the defiles of the Pisidian mountains. After a vain attempt to reduce Damasens, the rebies of this mighty host returned to Europe.

Third Crusade.-The death-blow, however, to the kinglom of Jernsalem, and the power of the crusalers, was riven, not ly Nouredim, but by Salah-Eddin, commonly called Saladin, a young Kurdish chief, who hat made himself sultan of Egypt, and who aspired to the presidency of the Mohammedan world. He invaded Palestine, took town after town, and finally, in Octolver 1157, compelled Jerusalem itself to capitulate, after a siege of fourteen rays. The news of this led to a third crusalle, the chiefs of which were Frederick I. (Barbarossa), emperor of Germany, Philippe Auguste, king of France, and Richard Cour-de-Lion, ling of England. Barbarossa took the field first in the spring of 1189, lut accidentally lost his life by ferer caught from lathing in the Orontes. Ilis army, much reduced, joined the forces of the other two monarchs before Acre, which important city was immediately besieged. In vain did saladin attempet to relieve the defenders; and after a beleaguerment of twenty-three months, the place surredered. But the crusaders mere not mated among themselves. Philippe soon after returned to France ; and Richard, after aecomplishing prodigies of valour, which exeited the admiration of the Saracens, concluderl a treaty with Saladin, by which the people of the West were to be at liberty to make pilgrimages to Jemusalem, extmpt from the taxes whinh the Saracen princes $1_{1 a r}$ in former times imposed.' This, as has been previonsly noticed, was all that had been claimed hy the first crusalers. On the Dith of October 1102, Richare set sail for lurope.

Fourth Chusade.-'ritsading menfortunately now beeame a constituent of the papal policy ; and in 1203 a fourth expedition was determined upon by Pope Innocent 1I1., although the condition of the Christians was by no means such as to call for it. It assembled at Venice; lut how entirely secular crusading hal liecome, will lie scen from the fact, that the army never went to Palestine at all, but preferred to take lossession of the Byzantine mplire. The lealer of this host of /iseulo-crusoders, Baldwin, Count of Flanders, was seated on the throne of the East in $1 \mathbf{2 0 4}$, where he and his suecessors maintained themselves for fifty-six years.

Fifth Crusculd.-This was commanded by Frederick 11., emperur of Germany. It began in 1228, and terminated in a treaty betwcen that monarch and the sultan of logrt, ly which Palestine was eeded to Frederick, who, after being crowned king
of Jerusalen, retrumed to Eurme, leaving his new possessions in a state of trancuillity.

Nixth Crusule - In 1241, a new race of Turks burst into Syria, and onee more the Holy Land fell into the hamls of these ferocions baburians. Jerusalem was homed and pillaged. in 1249, Lous AN. of France (St Lonis) headel a crusade against them, lut was utterly defeated, and taken misoner by the sultan of Eapit. By the payment of a large ransm he obtained his liberty, and that of the other prisoners. On his return to Einope, he was regardech as a sort of martyr in the cause of Clmist.

Seventh Crusnde. - This also was primarily undertaken hy st Lowis, lat he having died at Tunis in 1270, on his way to P’alestine, Prince Edward of Englant, afterwards Edward I., who had originally. intended to place himself under the command if St Louis, marchel direct for Palestine, where his rank and reputation in arms gathered round him all who were willing to fight for the cross. Nothing of consequence, howerer, was necomplished; and Elward soon returned to Eagland, the last of the crusaders. Aere, Autioch, and Tripoli still contimued in the possession of the Christians, and were defendel for sume time by the Templars and other military knights : but in 1291 Acre capitulated, the other towns soon followed its example, and the knights were glad to duit the eonntry, and disperse themselyes orer Eurne in quest of new employment, leaving l'alestine in the undisturbed possession of the Saracens.

Effects of the Crusales.-While we cannot help, deploring the enormous expenditne of human life which the $\mathbf{C}$. oceasioned, it is impossille to overlook the fact that they indirectly exercised a most beneticial inthence on modern socicty. They seenrel for humanity certain advantages whieh it is diffieult to see could have been othervise obtained. M. Guizot, in his Lectures on Europern C'ivilisction, endeavours to shew their design and function in the destinies of Christendom. 'To the first chroniclers,' he says, - and consequently to the first crosaders, of whom they are lout the expression, Mohammedans are oljects only of hatred: it is evident that those who speak of them do not know them. The historians of the later crusades speak fuite differently: it is clear that they look nunn thom no longer as monsters; that they have to a certain extent entered into their ideas; that they have lived with them ; and that relations, and even a sort of sympathy, have been estahished butwon them.' 'Thus the minds of both, lint partienlarly of the crusaders, were partly delisered from thuse prejndices which are the offspring of ienurance. A step was taken towards the rufranchisement of the human mind.' Secondly, the crnsaders were brought into emanct with two civilisations, richer and more advaned than their won-the Greck and the Saracome; and it is legond all 'fuestion that they ware minhtily struck with the wealth and emparative refinconent of the Dast. Thirdly, the cluse relatimaniju betwem the chief laymen of th. West ame the elnuch, werasimed by the C., enallad the former ' $t$, inspert more narrowly the palicy and motives of the panal "omrt.' The result was vary disastrous to that spirit of vencration aun berliof on which the charch liwes, and in many cases an uxtrambinary frodem of judgment amd hardienel of opinion were indued
such as bimme had nerer lufure dremed of. fourthly, great social hames wore brought about.
 :and towns- the early homes of liberty in liurope
 "Lave martime ommeree blu strongest impulse if hall wer remivel.' The mated illect of these thang, again, in prodisposing the minds of men for
ar reformation in religion, has often been noticed. Other causes midoubtedly co-mperated, and in a mere direct and decisive mamer, but the influenee of the (. in procming an andience for 1ather, camot be werlowed by the phiksophic historian.

## cRUSCA, Academil bella. See Acadear.

CRUSHERS, on LlUURELS, are implmonts used for reducing to small fragments eurn, beaus, linseed, oil-eake, and other similar hard food of horses, oxen, or lougs, in ordor that it may be more thoronglly subjected to the action of the gastrie juice, and that no part of it may pass through the animal undigested. Seerls which euter the stomach with their husk or outer pelliele unbroken, often resist its powers, so that they contribute mothing to nourishment; and this is the case to a very large extent with corn given to old horses; lut mastication is never so perfect, how. ever good may be the condition of an animal's tecth, that the previous crushing of hard fool will net be found useful. C: are of different kinds, and those intended for oil-cake are somewhat different from thuse suitable for aram; lut the essential part generally consists of tontherl. grooved, or otherwise roughened eyliniters, revolving so as to bruise the food either against each other, or against a fixed phate of similar roughess,-Cloi-cresuer is the name of an agricultural implement, which may be generally deseribed as a toothed or roughened ruller ; and will be found noticed, with its uses, in the article Rollen.
CRUST OF THE EARTH. It heing generally lelieved liy wologists that the interior of our glote is in a state of fusion from heat, they have given the name of crnst of the earth to the external solid covering. Man has been able to penetrate but a short way into the crust, amb he cannot safely reason on his olservations made at or near tho surface regarding the condition of the crust to a ureater depth than a few miles, at the most ten-all heyond is little more than gness-work. The materials of the crust are not thrown confusedly together, lint distinet mineral masses are found to eccupy definite spaces, or to exhibit a certain order of arrangement. All these may lie elassibied in reference tither to their origin, which is Aqueous (see Aqueots liocks) or lgmeous (q. v.); or to their relative arr, as l'rimary ( $\mathrm{q}, \mathrm{v}$.), Sccondary ( $\mathrm{q}, \mathrm{v}$.), and Tertiary (4. v.).
CRUSTACEANS (Crustacect), a elass of artienlated amimals, ayreeing with insects, arachnida, and myriapoda in having articulated limbs; lat differins from them in inpurtant respeets, and particulanly from all of them in the adaptation of the organs of respiration to an aquatic life, even those of them which live on land leing gencrally inhahitants of danp places, and lireathing ly akind of gills. Some of thu lowest and minute aquatic '.., indecd, are not provileal with gills; lort the aeration of the blow is supposed to talie place through the surface of the body:

The (' Therive their name from the hard armon Which in most "if them cavers the whole hody, forming fur it that sort of framework which is sontimes, mot very conrently, callod an cestemal Skollom: and which, in those of highest organisation, is wry comples in its structure, and contains a larce amoment of calcaroms matem-carlomate and fincrinate of lime, so that it is in its sulstance internealiate lutworn sholl and bone-whilst in many of tho lower and smallor kinds it eonsists principally of hifine, aml romesponls more nearly in its nature with the integuments of insects. Tho berly of : constimem is compussed of rings (see Abri(canat), grocally twonty-one in munber, and the
crustaceous covoring corrosponds with it in this respect; the rings, alikn of the homly aml its armone, beinge in some cases very distinet, whilst in others some of them in a greft lumbure enalosee or are consolichated torether, of whole tho thorax of it crab alloms an excellent examplo. 'Tlue first swem riness are regarderl as fommothe thent; the next seven, the thorax ; amd the remaineler the ablaman, comossponding with the locid, flmand, suml alolomen of insects. The ernstaenome cosoring is enasiderent ans at peculiar epoldemis, hawing hencoth it at the skin, from which it is an inorsmic evolathon; aml, like the epulemis, it is east wif from time thtime, that its place may he suppled anew, as thr stowth of the animal requires mare foom for the interasl suft parts. In this moultinf, or castimer of the shell, the animal divests itself of its covering not in sejrarate parts, but in une piece, inclarling the covorings of the limbs, and even of the antemer, althonerh the membranes which connect the hard plates are split and torn. A period of apparent sickness precentes and agitation accompraites the process ; man the thick muscular parts of the limbs of crabs and lobsters become soft and flaccid, so as to be much mure easily extricated from their hard coverings. 'The loss if a limb, which sometimes takes place on such an oceasion, and is otherwise a frequent vecurrence. is easily rejaired, for a new one grows in its stend; but it is a curious circumstance that in order to this reprotuction, the limb must be lornken otf at a praticular joint, the second from the lowly, thus leaving only a short stomp; and when a limb is broken elsewhere, the avimal itself exereises the remarkable power of throwing it ofl by this joint.

The principal organ of locomotion in many ( $\because$ as in the bonster, shrimp, \&e, is the alulomen, temminating in fan-like appendages; by bencling the alodomen suddenly down under the thorax, they dart bockwards in the water. The limhs-whieh are connected with the thoracic rims-are, in some, organs of swimminer; those of others are used for walking at the bottom of the water on on dry grouncl. Some have what are called fulise lum or pro-leqs attached to the alblomen, often very diflerent from the thoracic legs. 'The legs of some are fitted for burrowing. The first par of legs is not unfre. quently transformed into a pair of jowerful claws or pincers-the last juint lint one beinge protonged su as to oppose the last joint, which lecomes attreched as to the siete of it ; and these are used fur seizins and tearing foml. The limbs of the tirst thoracic rings are, in many C!, or, quas still more intimately connected with the month, and have recoived the name of foot-jaws, the transition from the true mandililes and maxille to the organs of locomotion being often very gradual. The month of some small parasitic (. is, however, formed fur sucking, and not for tearing and masticating foud, "lhe digestive organs are very sinmle in all : there is a short hut capacious gnllet, a large stomach, aml a straight and simple intestinal tube The pyloric region of the stomach, however, is furmisher with a remarkalle apparatus of hard tulereles or shart teeth for grinding of tearing fook, supplementary to the external organs of the month. Almust all of the $C$ : feed on ammal food, and they are very voracions. A fow feed on vegutable form. The nervons system of $C$ agrees generally witl that of insects, and exthbits many gradations of division and eonecontration. C..in gencral, appear to jussess all the tive senses. Their eyes are cither sinple (stemmatic). angregrate (consisting of several stemmata under a common cornea), or componnd. The compound eyes are often on foot-stalks. The gills are varinnisly placed; in the internal cavity, muler the cortouctthe enlirs rement of the plate of a single rinst, which

It is in menory of him the white tlaf with the blue cross (Dutch, hruis) still thonts from the linssian men-of-war.

## CRYOLITE—CRYPTOGRAPHY

CRY'OLITE is a double fluoride of aluminium and sodimm $\left(\mathrm{NaF}, \mathrm{Al}_{2} \mathrm{~F}_{3}\right)$, and is important as a source of the metal Aluminium (q. v.).

CRSO'PHORUS (Gr. kryos, colk, and phero. I cary) is an instrument consisting of a glass tube with a bulb at both ends. A little water is present in one of the bulbs, and when the second bulb, containing only water-vapour, is Ilaced in a freezing mixture, the vapour condenses, which causes more vapour to rise from the water in the first bulb. The result of this vaporation from the first budb is the abstraction of much heat, and nltimately the remaining water passes into a frozen state.

CRYPT (Gr. krypto, I hide), a vault under a church, eitber entirely or partly under gronnd. Crypts do not generally extend beyoud the limits of the choir or chancel, and they are often of mneh smaller dimensions. Cryphts were formerly used as chapels, and proviled with altars and the other furniture requisite for the celebration of religions services; and they were also very freguently used as places of sepulture. It sometimes happens that

Crypt of York Cathedral
a new charch has heen erected over the C. belonging to the old one. One of the largest ergets in England is that under Canterbury Cathedral; but there are few finer specimens of the 0 . anywhere than that under Clasgow Cathedral, which has been recently freed from rubbish and restored. Crypts seem to have originated in the enstoms of the early Christian ages. The tombs of the martyrs were first used as churches; and then churlies were buit above thens.

CRSPTO'GANOUS PLANTS (Gr. kumtos, concealet, and game, marriage) are those which have no true flowers, and no known mato or fomale organs of fructification, and whose seeds, ealled sprores, consist only of a single cell, and contain no cmbryo, lont germinate indifferently from any point ; and which Jussien therefore designated Amotpedomous fints (q. v.). The name C. R. was inventerl by linnets, and the Crymtogamie form a class of his sexual system, very distinct from all the rest. See Jonday. Jany C. P. lave no leaves; some lave wot even a root, and those which are lownest in organisation enusist only of a single cell. Many are prasitic. Many lonk as if dead in a dry atmosphere, and are revivified loy rain, They are the lowest in organisation of the vegetable kingetom, and are divided into filions (Ferns), Afersilemeer,
 tinls), Wasci (Nosses), Mruation, Lichens, Fumgi, - harmertr, and Alye.
(:RYP'YOC:l:AIPly, the art of secret writing, num: commonly called the arb of writing in ciphor (from Arathe siff, roid), tats leen in use from an Firly date: in corresponflone between diplomatists
and others engaged in important affairs requiring seerecy. In modern times, it has been the subject of learned eare to Lord Bacon, the ingenions Marytus of Worcester, Dr Wallis, Bishop Wilkins, Thicknesse, Falconer, Blair, \&e. In our own history, it has at no time been in greater requisition than during the civil war, and among the politicians of the 17 th century. And eren now, when there is happily less need for mystery among our statesmen, the need for a perfectly imdecipherable mode of secret commumeation has again had to be looked for, in order that information may pass by the electric telegraph without being understood by the officials in connection with the apparatus.

One of the most simple methods of C. is to use, instead of each letter of the alphabet, a certain other letter at a regular interval in advance of it in that series. Such was a mode of secret writing used by Julins Cosar. As a variety upon this plan, the alphabet is used invertedly-z for $a, y$ for $b, x$ for $c$, and so on. Or, while the first seven letters are represented by the second seven, the next six may be represented by the last six. And many other rariations may be adopted. But for all modes like these, there are modes of decipherment far from difficult. It is only necessary, in general, to bear in mind certain peculiarities of the language presumed to be used. Say it is the English. We readily remember that $e$ is the most frequent letter; that ea and ou are the double vowels which most frequently oecur ; that the consonants most common at the ents of words are $r, s$, and $t$; \&e. We also know how a single letter must be either the pronoun $I$ or the article $a$; how $a n$, at, and on, are the most common words in two letters; how the and and are the most frequent words in three letters; se. By taking advantage of these few obvious principles, a tolerably skilled decipherer will read almost any sueh piece of cryptographic writing in five minutes. The Times newspaper often gives, in its adrertising columns, correspondence on delicate subjects, even assignations for elopements, written $i \mathrm{~m}$ this manner, the writers of which are of course little aware how open their secrets thus become to socicty.

Politicians and important yersonages eonducting affairs of difficulty became long ago sensible of the necessity of using ciphers of greater abstruseness. The celebrated letter of Charles I. to the Earl of Glamorgan, in which he made some condemming concessions (elsemhere denied) to the Catholios of Ireland, was composed in an alphabet of 24 short strokes variously situated upon a line. Other letters by the same monarch are to appearance a mere series of numbers of two and three figures, divided by semicolons. 1 n such cases, it was mecessary that the two parties in the correspmolence shomld have previonsly concerted what worls each mmber was to represent. lineon devised what he thought a not easily penctrable cipher, in which be employed only u anil $b$, arranging each of these, in groups of tive, in such collocations as to represent all the $2 t$ letters. I'hus, arolueb ababa bublay ennvicyed the wond Fly. The ereat philosopher thought that preconcertment wond hare be necessary; lat in reality any cleser monlorn donipherer would have fomud no elifficulty in reading imy lorg lettor composed in snch a manger. The unfortumate barl of Arygle, when preparing his experdition agranst the tyrmmioal moverument of James Il., nsed a modo of secere writing which consisted in setting down the words at cortain intervals, whiel he aftorwamls tilled up with other words, making on the whole something intelligrid)le, but inditlerent. In our day, such a mode would not have ham fommi poof acranst the ingennity of those who have sturiod the nuans of decipherment.

Thero are many other moles of secret writing, which it does not seem mecessary to retail, as the art has become little more than a maiter of curiosity. One of the ablest and anplest treatmenty of the sulpject is an article by $\mathrm{Dr}_{\mathrm{r}}$ William liair in Recs's Cydopadia. See also ('humhers's Joumul, No. 506 (Second Series), umler 'Secrets lixposed,' and Nos. S7 and 115 , under 'Cyyptographes.'

CRY'STAL ISLANDS. See Coral Islavis.
CRY'STALLINE ROCKS, it name given to all rocks having a erystalline structure They are found belonging to every division of the crust of the eartli, but are especially abondant in the nost ancient aroic rocks; the greater proportion of intruded igneous rocks also possess this structure. When attempting in the laboratory to produce crystals, it is known that the bulding material must exist in a fluik condition, and this is obtained either loy huating to fusion or by solution. It has been asserted that all C. R. have been produced inder similar circumstances; and no one can doubt that lavas and more ancient rocks having a similar origin, have assumed this structure while solidifying from a condition of igneons fusion, while rock-salt is as certainly obtained from a saturated solution of salt. There are, however, many rocks, sneh as some fossiliferous limestones, in which this structure occurs, where it is not possible to conceive of their being in either condition. It is known that crystallisation takes place in solid material, as in the axles of railway carriages, or in the crystals of pyrites in the chalk, where the iron has been gathered from the surrounding material while in a solid state. We know not what is the force that induces such a change in solid materials: it may be called metamorphic or molectuar action, but these are names that mean nothing, and simply hide our ignorance. That such a force, inducing crystalline structure in amorphous masses, has been and is now at work on the solid strata of the earth, cannot be dombted.

CRYSTALLO'GRAPHY. A crystal is a piece of matter that, by the action of molecular forces, has assumed a definite cremetrical form of some kind, with plane faces. Thore is a great variety of crystalline forms, each form luing characteristic of one or more substances; and C. is the science which classifies the forms and slews the relations that subsist among them. The great majority of substances are capalile of undergoing the 1 rocess of erystallisation, the exceptions being princilally complex organc substances which tend to assume a globular or spherical form approaching that of organised structures. The most farourable condition for the crystallisation of any substance is from its solution in water or other liquid. A liquid usually dissolves more of a salt when warm than when cold; and when a warm saturated solntion is allowed to cool, a portion of the salt deposits itself in crystals. This process is that which is generally followed in the crystallisation of saline substances. A sccond process resorted to in the case of the metals, such as bismuth, antimony, \&e, and sulphur, is to fuse the material in a ressel, and when it is cooled down, so as partially to solidify the mass, the crust is broken through, and the bquid still remaining is poured off, when in net-work of crystals is obtained. A third method is to vaporise the substance, which on condensation resolves itself into crystals. Examples of this class are the formation of snow crystals from the watervapour in the atmosphere, and the minute hack crystals of iodine obtained by allowing its vipour to condense in a cold vessel or on a cold surface.

Many circumstances affect the crystallising power
of sulustances. Thus, water maty be cooled down below ity frcezing or crystallising point ( $32^{\circ} \mathrm{F}$.), provided it be kept perfectly still, withont becoming solid; but on subsequent agitation, it instantly erystallises. Sinilary, a hot saturaterl solation of sulphate of sodia, or glatulers salt, if cooled down in a still place, lues not crystallise, but inmediately doces so whan the ligpuid is agitated, or is fragment of any sulid substance is introduced into it. Tho size of the crystals oltainable from any divid deperals much on the rate of cooling, and the state of commotion of the liquid. The nore slowly the solntion cools down, and the more quictly the process of crystillisation is allowed to proceed, the larger are the crystals obtained; whilst, when the liquid is rapidly conlen, and agitation is kelat ul, the erystals are comparatively small, and graterally not completely formed. The reason of this will be at once apparent, for a large crystal is constrmeted of a multitude of smaller crystals, hilt up regularly so as to coustitute a compound erystal of the same form as the more minute crystalline atoms; and when a licuid is cooled slowly in a state of rest, only a few minute crystals are produced at first, and these are gradually built round on all siles by successive layers, till large, wr.ll. defined erystals are the result; while, when the liguid is rapidly lowered in temperature, and espe. cially when agitation is kept up, mancrous minute crystals are formed at onec, and do mit alliere together. In either case, the liquid from which the erystals have separated is called the mother-lipuor, and is a saturated solution of the salt.

The external forms of erystals amount to several thousands, but they may all be regarded as belonging to six different systems.

The regular system (otherwise called the cubie, octohedral, tesseral, tessular, spheroidul, or equi-a, red system) is characterised by having three axes or straight lines lassing through the same point, of equal lengtlas, and placel at rioht angles to each other. The best illastration of this system is the cube or hexahedron (tig. I), which has six square faces or planes, and the three equal axes (prmted in bold lines) terminate in the centre of each of the square faces. The planes or squares are symmetrically arranged, so that each is perpendicular to one axis, and parallel to the other" two. The crystals have each six square faces, with twolve equal edges, and eight equal angles. Examples of

Fig. 1.
Fig. 2.
substance which crystallise in the form of the clube or hexabedron, are-common iron lirites ( $\mathrm{F}_{1} \mathrm{~S}_{2}$ ), common salt, "r the chloride of sodium (NaOl), fluor spar (CaF), galena, or the sulphuret of lead (Pls), and the metals goll, silver, platimm, and eopuen: Anothar important crystalline form belonging to the regular systen is the octohendron (tig. 2), where the temninations of the axes are in the angles of the crystals, as represented in the figure ly the bold lines. It has eirtht faces, all of which are equilateral triangles, and twelve edges, with six ancles, each of which has four faces. The diamond (C), alum, zinc-hlende (ZnS), sal ammonia C. ( $\mathrm{NH}_{4}(\mathrm{ll})$, magnetic irom ore $\left(\mathrm{Fc}_{3} \mathrm{O}_{4}\right)$, fhor spar $(\mathrm{CaF})$, and
chrome irm wre, are exmmples. There are varions secoulary forms lelouging to this system, derivable from the culie and octohedron, such as the thombic rlodecahedron (tig. 3), which has twelve faces, and is the form in which the garnet crystallises.

The squme mismmtic system. (known as the myramidul, tetragonel, or puerlortic system) has threc axes piaced at right angles to each other, of which two are of troual length, bont the third may be longer or shorter. To this belong the right stuore prism (fis. 4), in which the lateral axes temmate in the contre of each sinle face, and the perqumlicular axis, is lonser than the two lateral axes; and the ritht spmere-baspl ocfohedron (fig. E), which resembles two pyramids placed

Fig. 4.

Fig. 5.
hasp to liase, and having eight faces, which form isosceles triangles. Examples of smlsstanecs which crystallise in this system are-yellow mossiate of peitash, native linoxide of tin, zircon, apophylite, calmmel, \&c.

The ritipt prismutic system (utherwise known as the right thombsidel, or ractomyular mismatic system) is characterised by having three axes, all of mernal or different lengiths, but placed at right angles to each other. The rayht rhombic mism (tig. 6),

Fig. 6.

Fig. 7.
 froms included in this elass, ant examples of materiaks which erystallise in this form are-sulphar, arsenical iron pyrites, nitrate uf potash, sulphate of putash, sulp, inte of haryta (heasy spar), thenz, arragonite, da.
'The whliqu' prismatic systen (ohlique' rhumbsilht, or rectunguler prismatie) lias three axes, which may

Fig. 8.

Fig. 9.
lue atl of murgual lomertha, fwo of which am plated at rinhte :unhes to whe wher, whilst the third axis is so imelined iss to be perendientar to ane of (3)
the two axes, and oblique to the other. To this belong the oblidue rhombic prism (tig. S), and the oblique rthombic-based octahedron (tig. (1). Many salts exystallise in this form, such as green vitriol (sulphate of mon), borax, sulphate of soba, carlomate of soda, phosplimate of soda, realgar (native bisulfhuret of arsenic), \&c.

The donbly oblique prismatic system has three axes of mequal leugth, which intersect obliquely wath each other. The forms are very irregular, which render them very prazling to make out satis. factorily. Vitrate of insmuth, sulphate of capper, sulphate of mandancses, qualroxalate of potash, and pyrotartaric acid. are examples.

The whombohetral, or the regular hearagonal system, is known hy the presence of fonr axes, three of which are in the same plane, and inchined to each other at an angle of $G 0^{\circ}$, whilst the remaining fourth axis is perpendicular to the three. So this belong

Fig. 10.

Fig. 11.
the reqular sir-sinlal. prism (fig. 10), and the rommoheilrou (fir. 11). Jxamales of this system arecalcareous spar, ice, quartz or rock crystal, nitrate of sola, beryl, arsenic, antimony, and apratite.

CRYSTALLO'MANCY, a mode of tlimination by means of transparent bodies, at one time very pupmlar. A precions stone, crystal globe, or other transparent aljeet, was employed, lut a beryl was eleemed most effective. In using it, the operator first muttered over it certain formonlas of prayor, and then gase it into the hands of a youth or virgin-mone others were pure enough to discern its revelations-who beheld in it the information required. Sometimes the desiderated facts were conveyed ly means of written characters on the crystal; sometmes the spirits invoked appeared in the crystal to answer the tuestions asked.

Csindi a town of Hungary, 7 miles sontli-south. west of Inkes. It is well built; some of the houses are even very tlogent. $]^{\prime}$ op. 93,100 , with a trade in grain, wios, and cattle. The women are also noted for their skill in making sacks and matresses.
csin A' , the name of two towns in Hungary, both situated on the Maris, the one with a popula. tim of 5000 w GOOO, and the ether with a popalation of 8000 , who are engageal in agriendtural pursuits.
('SAT, of CSATLI, a market-fown of Dumgary near the 'Theiss, and about 15 miles sontle east of Minkulez. lap. bonos.
 seholar anl travellor, whose nome in his own langinare is writton kiorise ('soma sandor, was born athut 1790 at Korios in 'I'ransylvania, amd equcaterl first at tha* wolleng of Ning-Enyenh, and sulosequantly at Ciattinion, where he itevoten himself with great zoal to thu' sturly of the Oriental tongues. "llu" drean :uml inspixatum of his hoyluond was the hope of ato dey diseostring the original home of his Migyan ancesturs ; and as lue grew ny, it lecame the sinfle thonght and passion of his life. In 1820 , he sut out on lis visimary pilgrimagro. After is year's intorval, hid friunuls gat a letter from him,
 that the ohject of his seareh would speedily be
ohtained. Leaving Teheran, $\mathrm{l}_{1}$ wandered nortlerast throngh Little liokhara, and at lenoth reachen 'libet, where he spent about foner years ( $15: 27$ 18:30) in the Rindohist anomastery of Kimam, stulying Tilectan. He soon discovered that there was little combection between that langutura and lis mative onn , lant still lo loped to make use of his resiarchers, abse soe ont for f'alcatta. Were ho leaned, to his dismay, that the literature of 'Tibet was simply it translations from the Sanserit-a lingmue he mieht nasily have acpurad a knowledge of at lanu. Hiswhole latatur secmed to lawe been in vain. Fortmately for $1:$, the library of the Asiaties sexioty of Benual com-
 no one comble catalone. ('. momertook and swecessially "xoenterl the task. Hy the great AngloImbian schoslars, l'rinser', Wilson, and othors, lee was very generonsly treated. He next prepared, at the experise of the government, a 'Tibetion grammar and dictionary (Calcutta, 1834), which was the first really aceurate and valuable Earopean work on the subject. It is still a standand treatise, ami lias been the guide of all grool scholars sinece U. wrute many articles on Tilnetan literature in the Asiotic Hesearches, but still haminterl, as of all. hy the hope of discovering the early home of the Nagyars, he once more set out on an experlition to the western confines of (lhima, lut alierl on the 11 th April 1842, at Dorjeeline, a sanitary station fur the British troops in Sikikm, 318 miles north of Calcutta.

CSONGRA'D, a market-town of IImgary, situated on a neek of land at the contluenee if the Theiss and the kiorios, 70 miles south-east of Pesth. The inhahitants, 12,600 in umulber, are chielly engaged in the raring of eattle, and the cultivation of the vine.

CTE'NOLD FISHES, an order of fishes, acenrding to a classification wroprosed by A qassiz (set Fishes), characterised by chenoid sealps, i , e. imbricated scales, generally rounded or avoid, with teeth or sharp projections on their hinder baresin. The name is from the Greek Rteis (gela, litenos), a comb. The scales of $C$. ${ }^{3}$. are horny or bony amd unenamelled. There are sometimes humerous rows

Ctenoil Scales.
of teeth or little spines, sometimes only one row, the rows sucessively wearing off as new mes are formed in the enlargement of the seale. Living C. F. are numerous, fossil ones comparatively few. Perehes, lomders, and tubot may lo mentioned as examples.

CTESI'BIUS, a Freek who lived ahout 250 years de. c., was born at Alexandria, and was famous for his inventions in mechanies. We owe to lim and his jmpil Hero Alexandrinus, the pump, the loent siphon, and also the discovery of the elastic force of air, and its application as a motive jower,

CTESILIMON, now Al-Madain, was a city of Assyria, on the eastern bink of the Tigris, the common winter residence of the Farthian kings, and finilly the capital of the Porthian lingiour. Its ruins still attest its former magnificence.
( $\mathrm{U}^{\prime} 1 ; A$, tim linenst ind mont westerly of the Antilles (IV.v.), anm tha must immurtant of the trans. marine: [mssemsions of Sjain, lics betworn the Carib. Jatan Sea me the si, and the Ginlf of Moxico, Ginle

('., though chiefly of primary formations, nunst yet havo land its structure mamifiorl by voloanie action, for limestone is fannol himh among the momontains, and carthunakes are still freducat. Josides racky rofos amil mumly shab fows, whish bescet almat tworthirels of thre corast, depuondent islets, of whinh los l'inos on thas sontla is tha most considerable, ara very numerons. In many lowahios, linwever, the sea is heep tor tho very shore, oflorines many exerllent havens, anal those, too, situatar on the buniest thomonghiaris of the western homisplaere. Not to montion the ports of lessur note, such as Matamzas, Sintiono, \&e., the Mrevout (in English, the M(embur) may elaim, alike in fosition, and entrance, and commomionsmess, to be one of the most eligible in existane. Berinming from the south-east, the (n)per Howntains ran nearly the lengetly of the island, culminatin" at an altitude of $65!0$ fect. With so lofty a watersherl on so seanty a wittle, the rivers ire necessarily small, so that very few of them are navigalele evon at their munths. Put such as they are, they fow all the year round, fur every nomenth yields its own supply : and thus they are enostantly awailable fur purposes of irrigation. At the lIavana, the ammal raindall is said to be 0066 inches, mol more than doulde of that in the opposite parts of Florida. With regram to atmospheric tendencies in reneral, ('. is sinurion to must of the West India lslands. Hurricanes are understomi to he less frement and less violent, at least un the land; and the climate, more especially amil the elevaterl gromuls of the interior, is at once pleasanter and more salubrious. With the exception of the central range of mountains, the country is more or less level, its spreading plains and swellines valliys being interspersed with lagoons and marshes. The cultivated portions of the lower tracts-a small part of the whole-produce abumdantly maize, rice, yams, bananas, sugar, coffee, tobaceo, cotton, cocua, and indigo ; while the uncultivated ilistricts of the same rear countless herels of cattle. For wheat and Hour, which have no place in native husbaudry, the colony is indubted to the mothercountry through a monopoly, wheh most mfavourably affects both the price and the quality: The elevated reginas of the ("rrper Nomntains, besides teeming with the metal from which they derivo their name, and here and there producing gold, silver, and iron, are corered with dense forests, in which, besiles ship-buiding timber, palms, the Mantain, and the mahogany are consplicuous. In addition to llarana, the eapital. 1 . contains 22 cities anıl towns, with $20-1$ villages and hamlets. Many of these rlaces enmmmnieate with each other hy railways, of whieh the ollest dates from IS3S. Of most if these works, Havana is the common terminus, being juined even with latabano on the south or opprosite sille of the island withont the ainl uf a tumel.

In 18.0 , the $[$ "inulation mamberel $56 t .608$ whites,
 together with an unemmerated suldement of eastern coolius. Dach of these classes demands separate remarls. With the exception of a few foreiguers,
whose presence is tolerated merely imder security for gool-behaviour, the whites may be divided into old suaniards and Spanish creoles. The former engross all the offices and favours in the gift of the government; and the latter conduct most of the agriculture and commerce of the island, being in this connection the main supporters of all 'internal improvaments.' Representing, in some measure, all the generations of immigrants from the days of Columbus, the Spanish ereoles, vastly outnumberiner the old Spaniards, form a great and growing majority of the inhabitants of Ewopean Dlood. In 1855, only 9000 white children, being clearly under a tenth of the full tale, were attonding school. The condition of the negro, not merely in U., but through Spanish and Portuguese America generally, does not render its possessor an ontcast. Men of colour are permitted to serve in the colonial militia, and the foremost literary character in the island is, or at least in 1855 was, a mulatto poet. Even the slaves themselves are not destitute of legal rights. They may, if they can, buy their luberty, being entitled to secure even partial exemptions from their toil in return for partial payments of their value; and, meanwhile, their domestic relations are recognised, and their corporal punishments restrictel to five-and-twenty lashes. That such legal rights, however, must often be a dead-letter, one may safely infer from the fundamental fact, that many, lerhaps most, of the slaves are wrongfully leld in servitude. Under a treaty with England, to euforee which a court of mixed commissiou sits at the Havana, Spain has long been bound to abolish the slave-trade; but neither the court nor the treaty has availed much, on account of the interested connivance of the local authorities. Nor are the national rulers themselves above the suspicion of complicity in this organised piracy. As regards the eastern coolies, the immigration from Asia is fully as hideons as that from Africa. It is well known to be, too often, equally involuntary in its origin; it incritably encounters, for a longer periul, the horrors of the middle passage; and lastly, it is apt to result in the collusive sale of such of its apprentices as may not have been worked to death during their term of indeature. The aboriginal population of C. has been exterminated by the sword, the scourge, and the blood-hound.
In 1492, this Queen of the Antilles was discovered by Columbus during his first royage. He called the island Juano, and Velasquez afterwarts named it Fernandina, but neither supplanted the native name Cuba. In 15l1, the island legan to be permanently colomised, becoming, within ten years, the base of all the various operations against Mexico. While, in the first quarter of the present century, every continental portion of Spanish America established its independence, C. remaining, like I'orto liieo, faithful to the mothereountry, larsely protited by the intestine broils of the revolted $p^{\text {roncinces, }}$ for, when the oll Spaniards were cxpelled in mass from the mandamd, many of them naturally took refuge in the still loyal islands, andiching them with their capital, and energy, and skill. C. has lond been eoveted by other nations. 1 In 1762 , the Havania was captured by a liritish armanant, but was restored in the following year. During the present age, the islind has been an whect of cupindity to the United States - a cupidity chackol more !"wwerfully ly jealousy on the part of Frimut: and Enthand than ly Spain's own resources: and, in fact, it has hern twice attacked in 1850 and $18.51-\mathrm{l}, \mathrm{y}$ individual Amerieans without sucerss. They wore commanded by a Spaniard of the name of Lupha, who, leing taken prisoner, was exceuted ans a traitur.

300

The government is understood io be thoroughly corrupit in all its departments. It seems to be as costly, too, as it is worthless. The taxation, according to an apparently antlientic statement, is estimated to be equivalent to $2 \frac{1}{2}$ per cent. on a collective ralnation of $500,000,000$ dollars, the actual burden reaching $£ 4,000,000$ sterling. The army ranges between 13,000 and 28,000 men; while the nary consists of 4 frigates, 15 steam-ships, and 32 small-craft. The imports, withont reckoning the illicit eargoes of 'live-stock' from Africa, are salted fish, bread-stuffs, and manufactured gonds; and the exports consist mainly of sugar, coffee, tobacco, wax, cotton, cocoa, indigo, molasses, and num. Excepting the importation of slaves, which is almust exelusively carried on by some of the 'free' states of the American Union, this external trade, in both its branches, is carried on with Spain, the United States, Germany, England, France, \&e.-the first tro countries being nearly on a par as to value, and either of them being vastly ahead of any of the others. Ever since the epoch of the general peace in 1815, the material prosperity of $\mathbb{C}$. has rapidly advanced. Between the year last mentioned and 1827 , the cnstoms of the Havana swelled from $1,725,963$ dollars to $4,383,262$ dollars. Between 1827, again, and.1850, the exports had more than donbled in amount. having grown from $13,111,416$ dollars, to $26,684,602$ dollars. In 1855 they amomed to $£ 7,395,600$. Such progress, so exeeptional in a Spanish community of recent times, has been, in a great measure, owing to extrinsic events. Among these, the wost prominent have been the independence of Hayti, the emaneipation of the haeks in the Eritish West Indies, and the abolition in England of those differential duties which han operated as a premium on colonial production.

CUBA'GUA, an island in the Caribbean Sca, off the north-east coast of Venezuela in Sonth America, is situated in the department of Maturin, betreen Nargarita and the mainland, about 30 miles north of the town of Cumana.

CUBE, a solid with six square faces, each of which is paralle to the one opposite to it. It is a form of frecunent occurrence in nature, especially among erystals. See Cfystallografiey. In arithmetic, the C. of a number is the prodnct of its multiplication three times by itself. This use of the term arises from the circumstance that the solid contents of a C. may be expressed by the third power of the number which expresses the length of one of its edges. Thus, if the edge of a C. be a lime of 4 inches, its sulid contents are equal to 64 cubic inches. Conversely, the C. root of a number is that number which, multiplied three times by itself, produces the first number. Sce Doubling the Cobe.

CU'BEDS, or CUIADB PEPPEL, the dried berries of Cubeta officinalis aml other species of C'ubcha, a , ronus of climhing shrubs of the natural orter Fiperacea, very closely allied to tho true peppers, but distinguished at onee by the contraction and elongation of the herrius at ihe hase, so that they appar to he stalked, upon which account C. are sometimes called liper cumbuth, or tailed pepper. Cublube uffeimatis is an native of Penang, Java, Now Guinea, \&co, and is sail to he extensively cultivated in some parts of Java. Its spikes are solitary, opposito to the leaves, and usually produco about fifty berries, which are glohnlar, and when dried, have much resemblance to hack pepper, except in their lighter colonr, and the stalk with which they are furnished. Cubplec canine, a native of the Sunda anl Molucca Islamds, is supposed also to yiede part of the (. of commerce, and the berries of $C$. Wallichii
possess similar propertios. (. are less pungent, anl moro pleasautly aronatic tham black prper ; they are nsed in the lase as a comdinmat, lint in Fimpore chictly for medicinal promeses thoy ate ats a stimulant, and are sometimes fommi useful in cises of indigestion, also in ehmate "atarms, int in many affections of the mucons membranc, paticnalialy those of the urino-renital systenn. C. dontain it principle called Cubebinesuralomons to that containerl in proper (piperine). (! appear to have leen kanwn in Whrope from anciont times. In [30 mranted to the conporation of Iomsan the pown of levying a toll of one farthing on "revy pmanal of $P^{\prime}$ prissing over London Billue.

CUBBC TOQTAT1ONS. A chbicernattion containinf but one umknown quatity, is one in which the highest exponent of the quantity in any term is ? livery such equation can be reduced to the gemerial form $n^{3}+\mu^{n}+q=0$, in which the coetlicitnt of $t^{3}$ is 1, and that of $x^{2}$ is zero. Evcry cubice eyuation of this fom has three roots, all of which may lie real, or one only may be real, and the other two imarinary. 'The roots will all be real, when $p$ is essentially nega. tive, and $\frac{p^{3}}{27}>q^{2}$ numerically. One roat only will be real when $p$ is essentially positive, or when it is negative, and $\frac{p^{3}}{27}<\frac{q^{2}}{4}$ numerically. If $p$ is csseutially negative, and $\frac{P^{3}}{27}=\frac{q^{2}}{4}$, two of the roots are equal. When one of the roots nuly is real, the equation may be solved by the following furmula, Known as Cardan's formula:
$x=\sqrt[3]{-\frac{q}{2}+\sqrt{ }\left(\frac{q^{2}}{4}+\frac{p^{3}}{27}\right)}+\sqrt{-\frac{q}{3}-\sqrt{ }\left(\frac{q^{2}}{4}+\frac{p^{3}}{27}\right)}$.
When the roots are all real, this formula fails to give their values. Nethods of solvinir (C. E. are to be found in most books on trigonometry and algebra. They are all troublesome. The reader will find the theory of their sulntion admirally dis. cussed ia Young's Thoory of Eiputions. See also EQuations.

CU'DICAL NI'TRE is a commercial mane applied to the intrate of soda (NaONO $)$. See SODA.

CU'BIT (Lat. cubitus), a measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the nidule-finger. The C. of the Romans was alount $17 \frac{1}{6}$ inches, and tlat of the Hebrews 22 inches, but its length is now generally stated at 18 Enghist inclies.

## CUCKING-STOOL. see DreniNg-stool.

CU'CKOO (Cuculus), a gents of birds of the order of Climbers ( (I. v.) ; the type of a family: Cuculicho, which contains a large number of suecies, mostly confined to the warmer regious of the globe, although some of them are summer visitants of cold climates. the beak is compressed and slightly arched, and the tail long and rounded, the wings rather long, the tarsi short, two toes directed forwards, and two backwards, the outer hind-toe capable of leeing brought half round to the front. The feet are thus alapted for erasping and moving about upon braches, rather than for climbiner, and the long tail is much used loy many of the sprecies for balancing the body, as they hop from branch to branch in the thick tropical woods which they frequent. The name ( 1 . is derised from the note of the male of the Common C. (Cuculus ctomus), which, although monotonous, is always heard with pleasure, being associated with all that is delightiul in returning spring . A similar name is given to the lird in many languages. The $C$. is a very widely difiused hird; it is foumd in India and
in Afriea, anel mifrates northwaris in shanaer, even to Laplami and Kinntchatkat. It appears in Britain in $\Lambda_{\text {pril }}$, and all exopet the youne lirds arre lowlieven to misrate senathwards arrain hedome tha minkle of August. It frequents both cultivatul distriats and

Common Cuckoo (Cuculus cinoray).
monss. There is no pairing or continned attach. nent of the male and female, aud the fromal, generally, if not always, lays her egres in the nost of some other smaller hird, isually one egg in a nost, leaving the egos to be hatched and the young one to be fed by the proper owners of the nest. 'Thac egry of the C . is very small for so large a lird, about equal in size to that of the skylark; lut the young one soon acquires size and strensth enough to cject from the nest any eges which may remain in it, or unfortunate young lirds, the true oftsuring of its foster-] wrents, and it seems restless and nneasy till thes is accomplished. It works itself under them, and then jerks them out by a motion of its rump. Its back at this early age exhibits a peculiar depression between the shoulders, so that an egg or a young bird can ensily be got to lie upon it; but this depression soon disaprears, and along with it the siugular instinct with which it is supposed to be conmected. The hedge-sparrow, the yellow-hammer, the pied wagtail, aud the meadow pipit, are among the linds must frequently selected by the C. as its substitutes in inculation and the care of its yommAmong the Cuculider of North America, one of the most interesting is the Yellow-billed American ! ?, sometimes called from its note the Cou-cou, or r'oubirl (Coccy/us Americanas), which, in its summer migrations, visits all parts of the country from Lonisiana to Labrador. It is among the rarest of British birds, but several instances are recorded of its occurrence in the British islands. It does not lay its egres in the nests of other birds, hut buidds and hatches for itsclf-exhibiting, however, a remarkable preculiarity in laying its eggs at such long imtervals, that a very evilent difference of age aljuears among the young in the sime nest.

CU'CUMBER (Cucumis), a genus of plants of the natural order Cucurbitacece. The Conmon C. (f: sativus), distinguished l,y heart-shaped, acmminately pentangular leares, which are rough with hairs approaching to bristles, and oblong fruit, is a native of the middle and sonth of Asia, and has been cultivated from the earliest times. Its fruit forms an important article of food in its native regions, the south of Eurore, Re., and an esteemed delicaey in colder commtries, where it is produced by the aid of artiticial heat. Many varieties are in cultivation, with frnit from four inches to two feet loug, rough, smooth, \&e. Young cucumbers are much used for pickling, and are called gherkins. The C'. is cultivated in fields even in the south of England, for the supply of the London market; but in the northern parts of Britam, the aid of a hot-bed is required
even to produce fruit fit for pickling. The $C$. requires a sunny situation, and a free rich soil.-To this genus belong ather species valued fur their datibe froit. (: Anpurio is a West Inchan species, witlı fruit about as large as a pullet's egg, much esteemed as an ingredient in somps. The Sxake $\mathrm{C}^{\prime}$. ( $C$, Maxuosus) grows to a great length, and is similar in iquality to the common cucumber. C. serotimes is cultivated in Turkey, C. mucrocurpus in Frazil ; the Cononon ( $C$. conomon) is much eultivated in Fapan. The Melon (C. melo), Water Melon (C. citrullus), Cbate ( $C$. chute), ank Kankoor ( $C$. utilissimus), are noticed in the article Melon; the species yielding colocynth, in the article Colocrath.-The Dodam ( $C$. dulum) is very generally cultivaterl in gardens in the East for the fragrance of its fruit, which, bowever, is almost tasteless. It is supposed that this plant is sometimes meant in the Ohl 'lestament, where the Lioghish version has mandrokt The spiming C., squiting (., or Wide (., which yielts the bug called Elaterium (y. v.), beloogs to an allied genons.

CUCURBETACEF, a natural order of exogenous plants, consisting chiefly of herbaceons plants, natives of the warmer rerrions of the globe, having sncculnent stems which climb by means of lateral tendrils. There are some shrubloy species. The fruit (pepo) is peculiar; it is more or less succulent, has a thick tleshy riul, and the seed beariny $1^{\text {narietal placente cither surrounding a }}$ central cavity, or sending prolougations inwards. The sects are flat and ovate, embeddel in a sort of fulp, which is either elry or juicy:-This orler contains about $3: 10$ species, very many of which yield fruits much used for forcil in warm climates, and some of them are cultivated in colder regions as articles of loxnry. The fruit of some attains a very largen size. To, this order belong the Cucumber, Mclon, Gourd (of many hinds). Pumplain, Squash. Vequtable Harrow, Enttle Guncl, \&e. The young shorts and leaves of many species are also used as potherls; and the roots if sume aboumd in a hand fecula, and are elible, as those of Momondich divica amel Iryonic umbellativ, East Indian plants. Yet acridity is a jrevailing characteristic. of which the Spirting Cuember (see Elaterica) of the south of Europe, anl the (immon Bryosy (q. v.) are examples. These are not without their use in medicine. bat still more impurtant is the Colocystar (I.v.).-Among the more interesting spocies of this order is Hodusoniu heteroclita, a gigantic species, which is fomil in the Ilimalaya Mountains, ascemt. ing to an clevation of 5000 feet. The scerls of some ( $\because$ are used as almonds, anil yidil oil by expression, as those of Trfivirice pedato, an A fricau plat. Brymum dioica is the mbly liritish species, and does not extend to ficotland.
 anil litmus (g.v.), and olitained in the same manner from lichens liy the a ction of anmoniacal liquiels. It is chietly emphoyed as a purple-dye for womblen yarn, lut the enlour is rather fugitive. The mame Co, of Clenes is often appropriated to chu particular speccies of lichen, Lefmome tarterea, whets is abmulant on rocks in the Highlands of Sentland and in the Apine amd nurthern districts of Furope, and frow which the dyestutl ( 1 . is usually whtained hy nacration for tou or twolve days in urine with wator cum clalk. Tho pane is a corruption of Gollatot, ame is deriven from that of lor cuthbert Ciorton, under whase managenent the manafacture of this dyystutf was bugn in leith alwut the yar 1877, by N1r Mamentosh of (ilasgow. shields. It is somotimes called Ihthen bicelish Moss, being largely importel] from Sweden.

CCDDALO'RE, the chief town in the southern division of Arcot (\%. v.), is one of the few seaports m the Coromandel, weast coast of ITmulustan. It is situated on the estuary of the Southern Pennaur, a considurable tributary of the Bay of Pengal. heing in Iat. $11^{\circ} 43^{\prime}$ N., and long. $-9^{\circ} 50^{\prime} \mathrm{E}$. It is 15 miles to the south of Ionclicherry, and 100 to the south of Mudras. Though the river itself is beset by a bar, which admits inly vessels of moderate size, yet there is good anchorage off-shore at the distance of a mile and a half. The site is not more than 5 feet above high-water mark; but notwithstanding this apparently insaluhrious josition, the climate is sain to be peculiarly healthy. C! was at oue time a place of great strength; and in that respect it was frequently an oljject of contention in the wars which. during the latter half of the 1Sth c., so long desolated this neighbomhood. In 1758, it was taken by the French from the English, who had held it for 77 years ; and, after varions intermediate vicissitudes, it was finally ceded to its original possessors in 1783.
$\mathrm{CU}^{\prime} \mathrm{DD} A \mathrm{PAII}$, a native town with a military cantonment in the presidency of Mabras, from which it lies about 140 miles to the north-west. It stands, at the height of sut feet alove the sea, near the right or snuth bank of the Northern Pemaur. which flows into the Bay of Bengal. Lat. I4 $32^{\prime}$ N., and long. $78^{\circ} 52^{\prime}$ 1. The native town itself claims nutive merely as the capital of the district of its own name; and the military eantomment, pleasantly wromging the Fogawanka, an anxiliary of the l'ennaur contains larracks fur Europeans, aud spacions lines for seluys.
('tDDOMPAII, the listrict mentioned in the prombine artich, extends in lat. from $13^{\circ} 12^{\prime}$ to $16^{\circ} 199^{\prime}$ N. and in long, from $\because 5$ to $70^{\circ} 45^{\prime \prime}$ k, containing 12,960 squar miles, and $1,451,921$ mhalitants. Shomg towards the tiay of bemeal, the comery ramus, in its womal clevation alove the sea, lutwect 11 s2 amb hiol fuet. (' is traversed in its length from north to sonth ly numerous paralled rilowe, which constitute a part of the fastern Ghats-sme of the peaks mang :300 feet above the sea level. Their old possessions -among which were seven town-lands containing 1403 acres, seven rectories, and four vicarageswere, in 1634, bestowed upou the vicars choral of the cathedral, who still enjoy them.

There were at least seven other houses of $C$. in Irclanl, viz., at Clommacnois, Clondalkin, Devenish, Clones, Гopull, Monanineha, and Sligo.

If tradition could be trusted, the first appearance of 6 . in Scotland shonld be placed about the midde of the 9th century. A lenf of the Register of St Andrews, written about 1130, relates that Brude, the son of Dergard, the last limg of the licts (who ceased to reigo alront 843 ), gave the island, sinee called St Serf's Inch, in Lochleven, to God, St Servan, and the Cuhbe hermits serving God there. They were governed ly an ablot; and abont the Sear lols, durins the rule of Abbot Ronan, they gave up their ishand to the Bishop of St Andrews, on condition that le shand find them in food and raiment. They had grants of lands or immunities frum all the lings of the Scots who reigned between 1039 and $115: \%$, the roll of these royal henefactors being headed lyy the renowned Macbeth (1039-1056) and his wife cruoch, the daughter of Bodhe. They havl a grant of a church from cach of the thrue bishops who riled the see uf st Andrews between 1040 and 1093 ; and about 1120 , they had a grant of lands from one of the soms of King Maledm Camore and St Darguret-Ethelrel, Earl of Fife, and hereditary lay-ablout of the Culdee munastery of Dunkeld. A fuw years afterwards, the Bishop of St Andrews gives their island, and all their possessions, inchuling their chureh restments and their books, to the newly fommded Cinoms Liegnlar of St Andrews, in order that a prory of that rule mirght supplant the old ahhey if C."in St Rerf's Inch. About 1140, the hishop's grant was enforced by a charter from King Davil, in which it was ordered that such of the C . as chose to live canonically and peacefidly maler the new canons shonla remain in the ishmi. - If any one of them refuse so to do,' says the king, - my will is, and I command, that he be cxpelled from the island.' We hear no more of the Culdee hermits of Locheven. The C'anons Regular who eane in their place continued till the Buformation, anl we are indeltal to one of their priors, Anlyew Wyntun, wha died about 1490 , for a valuable mitrical Chronicle of Soutland. A catalogne of the books of the Culdee ablicy, when it was bestowed iumon the Canms liwgular of St Andrews, about 1i.11, has hen preserved. The number of volumes Waw not quite twonty. They were-a Pastoral, a (ifmulal, a Missal, some of the works of Origen, the Sentences of int lernard (who was still lising), a Treatise (n the sacraments, in three parts, a part of the Bible, a luetionary, the Acts of the Apostles, the Ginsule, the wonks of Prosper, the lwoks of Provern, Declesanter, and (Gatieles, a Gloss on thu: 'anticles, a work called Intorpretationes Diclimum, a collection if sintences, is Commentary on (enesis, and in 'reatise on the Exceptions frum licelesiantical liules.

The (: vi st Ambews were of more importanee, and nut ferlaplos loss antiguity, than those of [ondheren. 'Tlie death of an ahmot of St Andrews is chanicled by the: Trish amuals in 747 . It is not salisl that he was : ' 'ulder: lat in !ll, when Constantine, the hing of soots, exchamed his crown fir a mumbes comb, it is recorded that he became 'ahlut of the Culder of St Andrews.' No more is lsand of them till :hmut the millite of tho leth centary: A miay of C'mons linghlar had now

## CULDEES

been phated beside them, and from its rowors we bearn that in the churd of it Ambew, wheh as it then was, there wre thitwon $!$ ?, hombing
 aceming to their own hasme and the tranlithons of mon, than after the rulas of the hilly fathers:' that some few thious of little imphatano they persessen in common: that the rest, indorting What was of most value, thery hehel as the in arivate property, emph enjoyins what he got from relatives and kinsmen, "f from the landoldone granted on the tenure of pure frimblshe, or othorwise: that after they becme d, they wore forbiditen to have their wives in their honses, of any wher women of whom exil sumpicion cond arise; that the altar of St Andew was left withont a mimister, mu' was mase celelmated there except on tho rare necasion of a wisit from the kine or the bishop, for the $(\because$ satid their own otlice after their own way in a corner of the chureh. 'Ihe attempt to supplant the 4 '. Iy Gamens Regular, which had succertal at Lochleven, was repated at St Andrews, mat failed. The (1. Kegt their own church-st Mary's, or the kink of the Thengh-and has a voice along with the Cunons hegular in the clection of the hishop. Their ahbot disamears about the midde of the 11 the c ; and soon alterwats their 'prior' exchanses that tithe for the nume of 'provost.' 'Thein distinctive character was gradually passing away; before the and of the lith $c$. they lose their share in the election of the bishop; their name of Cuhde is hearl no more; their church, alont the same time, takes the nane of the Kimg's Chapel-myat ; ant benceforth there remains nothing $t u$ distimgnish then from the secular priests of other colleniate churches.

The C. of the church of St May at Mmymnsk, in Aherdenshire, appear to have heen fomidel ly the Bishop of St Ambrews towards the eme of the Ilth century: In the liegiming of the 13th e. they are found making clam to le regardel as Canons hegular. The chim was resisted loy the Bishry of St Amrews, and in 1211, after an appal to Rome, the dispute was settled ly a compromise, which poridel that there shomble thirteen C. at Monymusk, of whom one to he chosen by the bishop) Trom a list of three presenten by the other C.shonld be the master or prior ; that they should have a refectory, a conmon domitory and an matory, lat mo ecmetery ; that they shmale net alont the monastic or canonical life in rule with. ont leave of the hishop: and that when he eme to Monymusk, he shombl be reeeived by the (. in solemn procession. Before this agrecment is 50 years wh, the name of C. dixappars from limymusk, and their house is recognised as a piory of Canons lecgular.

C are foum at themethy, in strathearn, atome 1120. In the cad of that century, than fussessions apar to have bem diviled betwen their hemeditary lay-ablot (the fromder of the noble family of Ahernethy) and the prim and ( $!$. 1 y whem the burden of the ecelesiastical offices was lwome. In $1: 73$, they Were transformed into Comos lieghlar. The same partition of the ('uhlee reremnes which apmears at Aberncthy, is fomul alsor at lirechin. A layman. who is abhot only in mane, inlerits a large share of the culdee patrimony, and transmits it $t$ ohis descembants, who seon lose even the name of abhot. The prior and his C., memwhile, are absorled inte the chapter of the new hishmric, fombled at lirechin ly King David I., about 1145; in less than a humdrel yoars, the name of C. disappears, and the chapter is one wholly of secular camons. The sane silent chance of ('. intosmeular camens. which trok phace at Brechin during the 13the, took phace also at Dumbane, at

or corn-plants amonis erasses; but with these are botanially assuciated other specius-usually far move numerous - to which mo great value has even heen attached, or which are objects of interest to the lootanist alone. It may be that, in some instances, the original preacence of certain species was accidental, anl that their present superiority over certain others is merty owing to the improvements etfectel by cintivation; hat we are no more entitled to assume that this has been ordinarily tho case, than that man has in lis seleetion exbansted, or nearly exhansted, the resomrees of nature. Some plants are known to have been cultivated from the most remote historic ages; some have hint recently become the objects of human care, which yet are leservelly estemmet; aml, in some instances-e. g., sea-knle-these have not been introduced from regions newly explomed, lut are natives of the very comatries which have been the seats of ancient civilisation. I'monbly, in the earliest ages, plants useful for forl alone were cultivated, and of these only a lew kimls, as is still the ease among savare tribes; it may prehaps be coubted whether plants yieldins filre for clothing and cortage, or plants from which alcoholic beverates or narcotics cond he procuren, were most likely next to "ngare attention.- (I. l'.. lilants affording articles of haman foul are certainly the most impurtant, as well as the most mumerons class. through no necessity of elimatic mapiation, hut rather from want of interemuse among mations. Thas, some of the finest ornaments of our preennouses and gardens, recontly introluced into Linope, have heen diligently coltivated from time immemorial in China and Jipran, in which countrics also many useful plants are cultivated still ahmost unknown in other parts of the world. The antiva tion of useful aymatio plants is practised in ( dhina to a desree wapromehen in any other montry.

The changes proxuced by cultivation present an interesting and ditheult suljeet to the student of vegetable physiology. Increase of hoxuriance and size is a result which might have lem rxpmoded from almodant nutriment and favomate circmo stances of growth; but the determination of the strength of the phant in its vegetation to particular parts, and their greater promorionate incrense, is a more remarkalile phenomenon, although of common occurrence, as is also the consideratle mondfication of jnices and qualities. 'To these effects of cultivation, perpetuated in the progeny of the plants, and increased from one generation to another, we owe many of the most useful varicties of cultivated plants. Our cabbages, turnips, earrots, \&e., slifer very much from the wild plants of the same species; there is little, for cxample, that is catable or nutritious in the root of a wihl turnip, and the acridity occasionally to be observed even in enltivation exists in it to a mueh greater degree. Wild celtry is poisunons, or almost so. How far the eflicts of cultivation can be extended, is a question not yet decided in general, nor with reference to partichilar sprecies.

CULITVA'TION. The term includes all operations for peparing the soil for those exops which man speciadly selects for his ust. The spade, the hoe, and the flongh, have been the primary iniplements of C. among all nations as far Fack as their cisilisation can he tracel. All these effect much the sime encl. Hy their means the soil is stimed and inverted, whelis keeps under the verectation that is snpulanted, and loosens the suil to admit of the ronts of the sown plants to rom throurh it. The barrow e rake, on the "ther hamd, is empluyed to smooth the surface and coser the seal. Tho allow of the (1) of the creps when they are growine, in many cases the sechs are flanted or som in rows Coreals, for instance, ars, with this view, wften sown with a drill in rows from six to nine inches apart; and the namm rows are cithor enltivated by the hemel or horse hup. Again, tumips, potatoss, and cther green erols are sown at wider intervals, from 24 to 30 inches, and are caltivatend during thein growth by horse-hoes of varinus leseriptimes. The implements usel in O . will be luest treatel under their special names, and under the different erops the jeculiarities of their cultivation will be considered. A fow general principles, however, whel onglat to be kept in view in the C. of all erops, may be here stated.

The soil, in the first place, should be as completely inverted as possible, simec it is an important object to smother or hury the surface-plants, and bermit them to decay within the soll and yich fomd for the plants to be sown. In the secoud phace, it should be rembed as loose and comminuted as possible; for earth in this state both allows an excess of water to lase thongh it mome easily, and it also retains a larger supply within it for the wants of resetation when the weather is dre. Land that is tilled in antomn may be left open, romgh, and cholly, as the frust of winter will lowsen ant pulverise it by spring. In a dry and warm climate, the desired state of the smil is secorent by abnntiant plonghing, rolling, and other opera-
tions. In a wret and moist climato, theso must be nowe sparingly resortell to, as a monduately mond mould facilatites the hraining away of excassive rains, and provents the soil irom lecoming eronsoliditatel liy such exeress.

We mow proced tu give what may he called the reants of the inventigations of the cuncifom character in general, np to this pesent munent; lont we mast wan the reader beforchand, that thongh mach has lecen done, more remane to be done, and that a fow years may change the whole aspect of cumbifom :thines.

C'meffom writing, as we sumb hofore, was used for mommental recorls onls, a cursibe writing from right to left-leing used for records of minur inpurtince. The iuscriptions are mostly fomed in Hhere parallel columns or tahlets, and are then trandations of each other in different alphabets and langmages, catled respectively l'ersian, Al dian, amb Assyian; the Achamenian Kings being whiged to make their lecrees intelligithe to the thre principal nations under their sway, as in our days the whah of Persia would use the Persian, Jurkish, and Arahe l:mguages, in orler that he might be understood in lonedad and Teheran.

The first of the three, the Persian-first, in so far as it always holds the place of honour-comxists of 89 to It letters, and is the most recent of the three, the must ancient leing the Assyrian. It is distinguished by the olligue stroke which divines its worls. Its letters are compused of not more than tive strokes "w wedres phaced side by side larizontally or perpendicularly, or both, never-with one exception-crossing each other. The lanmage
 to he as near shansuit as prossible, althemghot so retine tanl tu be the mother-language of mandem lemsian. It is only twice fomm $\mathrm{h}_{\mathrm{y}}$ itself; all the other inscritions ire trilingual. The thane of its
 whost instance of its cmphement is an incriptime
 that of Artaxumes Uchus at Perscpelis. 'The mast important is that of Darins 11 ystanpis. in the ereat macripion of Pehistun, which contains, linilns frombidenal reents, a description of the witent it his furwer, the leadins inchents of his riene,
 t. . the bailding of the palacos-the last tiwn sulajents menerally forming the maly contents of the other lersian inseriptinss. 'The inseriptinn of Artaxerees ochas is impontant, in sor far ats it trame hes wigin to the Achamenide, thenuch Arsames, gramefither of Darins. Most of thas
 linstan, and llamadun.

Thes swond bind is ealled the Dlalim, lnewnse it t.alios the second phan in the trilingal matertions,

 in that ribtion th thase two mations, that man was sidnotal. Ameller mume, "'cy thic', las been

 similar to the attempt of rempstructing samerit
from some detached aud wery dontitul lrench and linglish worls. These inscrptions never oweur ly themselves (nme instance agam exechted) and being tramsations of the Persian recoris, alnat ninety nanes bitre bech ascertained, and an appathet of abont 100 characters-combinations of as syllatio nathre-has been established. The principal investhators of this character are Westergand, De Simuley, Bincks, Norris, aml Oplert. Cinfimean holds the hagragre to be ffuzvaresh, a mixtme of hanian and romitic.

The thind and most important is the Assyrian portion of the emeiforms. 'The trimgual reents Gave the first che to the decipherin: of this character ; lout many miginal, more than a thamsumb years older, docmonts have since leen foumd in Lhalon, Nineveh, and other places near the Fmphrates aml Tigris, an! even in Egyt. Alnut fofi diterent signs lave bea distinguished on slabs, eylinders, harrels, pisms, if a phouctio, sylubic, and iblegraphic nature. Irmer names are preceted hey mongrans, which give the same hotp to their reatings as cartowhes in hisroglyphics. of those fol signs, however, hardly one-tenth are known for certain. I'roper names were foum varied to about dive times, and the characters themselves are loth hommphoms (same somed expressel by variuns signs) and polyh honons (same sigu with varions sombls). Five and more dialects have heen distinguished in the langate, which is decilady Somitic (Gromean takes it to be simply Arabic); and these dialects are surposed to have belonged cither to different tribes or subsequent perimis. It is this alphabet about which the greatest mertainty and confusion prevail, for endess sublivisions, and even certain assumed grammatical forms, do mot constitute a certainty. There is, however, is lope of its crentually being fully deciphered. A few years ago, the Asiatic Society sulmittel a eylinder of Tiss lath-1'ileser to four prominent insestigators of the subject, and they imberendently real it nearly alike, with exepption of the proper names, where they widely differed. As a prow of the enormons importance of this character for history, grammar, law, mythongy, archemosy, and antiguties generally, we will name some of the recorts of whifh Jiawlinson, a fow years are, polnsed the pullication (now
 laricks from Kilehsergat, of the ealy lings of Assur ( $12-3-1100$ ), in is character approaching the
 Smals of sardanapalus, of shamas, father to the hiblical Pul, of the biblical l'ul and Semiramis, his wie, of Sargon, Sematherib, Assur-hani-1al, som if Esarhadhon; ('ylimder of Nehmehatnesar ; 'ylimhers entaining the motice of belshazar, \&e.: hesibes swhalmius, vocalmbaries, mathematieal and astrommical tablete, colmhlars and registers, ant mare tham foem mythagical tallets. Nity, if the liars-ximrul really stame on tho fomelations of the wh tower of lalinl, we minht in the hridks exeatwath at these very fomblitinns read the lathence xuken at the time 'whon the whole carth was of one sperch.'

As th the mbing of the character, we will brielly st:ite, in convinsin, that mollimes cortain is kinown, or is likely to be known hor sume time, it is not makely, howerer, that it was hioroglyinic, althongh mither tha tishes nom the berewhide these
 have monc in thair fabour than the woms, whel were said th he their meromstious anthers. The frullowing is the apmon of hawlinson on this print: - That the amplogment of the cumeiform character miginatal in Sosym, whila the systom of writing th which it was abponel was horrowed from lagyt,
will harlly abmit of fumstion. Whather the equri[omm Jetters, in thair prismitare hapmes, wope intamdel

 (1) whether the prent al Appothre was fron the

CU'RRACH, COURACH, of CORACLE [frlt. comeg, cerach; Lat. neweco chrorinem, sumbus), the nance given in the British islames to a monne on twat, made of a slender frame of wool, owvered with skins. Skifls of this sort, as well as cannes hollowed cout of the trunks of oaks, were in use among the Brituns in the earliest times of which we have reconl. Julins Chesar, who lmilt some of them after the British morlel, tells us that the keel ani gunwales were of light wook. and the sides of wicker, coverel with hilles. Similar descriptims of the (' are given by Miny, Lacan, Solinus, Festus Avienus, Sidmins Apollinaris, and others. The first ocenmence of the name scems to be in Gilhas, who wrote in the 6th e.: he speaks of the ('. as in use amone the reots and the licts. A long royage in the North Sea, marie in a $e^{\text {. during the sane century, by ome of the }}$ companions of St Comma, is commemoratel by

Modern Coratle. Adamam, who died in 70. In 578 , three lrish missimaries sailed in a ( ${ }^{\circ}$. from Ireland to Comwall; the vopare ocenpied seven lays; ant the size of the $C$. is imlicated by the remark that it was one of two skins and a half. An whid life of St latrick sueaks of a 1 . ' of one skin, with neither helm nor oar.' The C' of a larger size had a mast and sail. The C. still contimnes to be usal on the Severn. and on many parts of the Irish coast, especially on the shores of Clare and Donegal. The last C. known to lave Inen used in sentland is in the musemon at Elgin. It was cmplayed on the Spey, towaris the ead of last century. Shaw, whose Histony of Monely was publisheql in 1725, when the (. hanl become rare, thus describes it: 'lt is in sluape oval, 125
notr three feet lroal, and four lngz ; a small kel rums from the hand to the storn; a fow riles are phived arrose the kerl, and a rime of pilald wow aromet the lif of the machine. The whold is covered with the rough hide of an ox or a horse: the seat is in the middle; it carring but onn person, rir, if a seemil gnes into it tu be waftol wer a river, he stands behime the rower, leanine on his shombors. In flotiner timber, a rope is fixed to the float, and the rown holds it in rase ham, and with the other manares the patile. lle Fereps the that in dep water, and hrines it to shore whon he will. In returning home, lue carries the mithine on his sloolders, or on a horse.' (he whon fiesures in the Imatiol-Aarm Hill the pret-ly shewing the Strathapey Highlankers how to make their timber into a navigalde raft, hastrnes the disapperarace of the ('. from Sentland. A description if the 1:, as still nsed in Treland, will lue fomen in
 lonat of lisom skin, essentially the same with the liritish coracle. is in use among some of the Indians of Nurth Ameriea.
('U'RRAN, Juhe Pumpot, a celdrated legal and promentary oraton, bom at Newmarket in the comnty of Cork, lrelan?, July $-\frac{1}{2}$, 770 ; was calucatel at Trinity Collece, 1)nblin; and in $172 \cdot \mathrm{H}$, having resolved to adont the law as a profession, wont to Lombun and enteres himself at the Dinhlle Temple. Two years after, he was called to the lrish har, where his humorms. Howery, and sareastic spopeh secured him immodiate success, which his attractive sucial qualities did much to extenct. In 1752, he oltainel a seat in the lrish parimmont as member fur Killegean, his renerat policy heine in unisom with that of Mr cirattan and the fow other liberal members who were then in the Homse. In dehate. 1 . was usually chargel with the reply to muments, for which importiant cluty his realy speech and cuttins retort almirahly analition him. But his sareasm led him into several inels, in which fortunately little ham was elone on either side. In 1785, he was in fasmor uf the fomation of lrish roluntcers: and in subsempent years, he was constant and doquent in his appeals to government to alopt a different !ulicy towards lrelame as that which it was pursuing was likely to drive the pende to rebellion. (arvemment gave uo heel, amt the robllim of 1 g!9 was the consempence. C. hat retirel from parliament lufore the Enion, of which he was a warm opponent. ILe was apprinted Naster of the Rolls in Ireland in lsug, an office be held until 181:; when he resigned. He died in Lamdon, October 14, 1517. (\% is best remembered fur his wit and gairty, of which mayy excellent examples are preserved in the varions Memoirs, Recollections. \& co. of him which have been published.

QUliliANT, a name origially belonging to a small kind of erpate (sce Ctrimists), and transferyed,
in consequence of the similar size of the fruit, to many species of the wenias Pithen, the most impurtant and almost the whly wemus of the matal order Gimsathermear. 'The species known as chmonts are Arstitute of slines, and have the flowers in racomes: the spiny species are known by the mame (oosedenis (il. . . ). Among the fruit shruhs most generally cultivaten in whr garilens is the Ken C. (Li. rulimen), (roosselle of the Pronch, a mative of woods and thickets in the south of Europe, fonn alsu in some parts of Asia anl of North America, perlaps rather a naturalised than a truly mative phat in lirtain. It has long been cultivateel, although it does not appear that it had a plare in the garkens of the ancient Greks or hamans. The herries, hesides being used for lessert, and to a much greater extent for pies, and for making jully; are usel also for making an agreathe and refreshing heverage, called in France Eitut de Grusseilles (mane of the juice uf the fruit, water and sugar, strainel, and iced), and a well-known fermented hquor called Curent Jline (4. 3.).-The Whire ( C is a mere varicty of the Rem, the result of cultivation, with fruit less aciul, and more fit for lessert, generally also rather larger. There are many sub-varieties, ant many intermediate shales of colour. Both the Fell and the White Currants are either trained as stanlard bushes, or aginst walls, the latter treatment producing larger and finer fruit, and buth are sometimes trained on a nortl wall, to retard their ripenimg till after the molinary season. They grow readly, like the shruls of this genus in general, from cuttings. - The Buats C. (f. nitrum), Cusis of the French, grows in moist wools, and on the banks of streams in Lurope and the north of Asia. The front is much larger than the leal C., and cultivation bas lately moduced varicties remarkable for size. There is a raricty fonme in liussia with yellow herries. The Black © is not sor much enltisated in Cermany and Honlam as the leed, and is comparatively nembected even in England, hat is to be foum in almost every garden in sontland. The jelly and 1 reserve mule from it are very useful for sure thrats, as is also fluck (? I'ineyter, male in the same mamer as liaspherry Vinegar. In linssia, the berries are gathered in large quantities in the weors, and dried in ovens, to be used in pies. They are tonic, and also shightly duretic and sudorific. A liquenr, called Lampeur de Cowis, is prepared in France from the Black © . . the manufacture of which has recontly aequired a great importance in the roite dor and neiphbouring delpartments. The town of Dijon contains more than thirty manufactories, and prouluced, in 1509. not less than 220000 gallons of this ligueur, the whuldsale price of which-of the best quality - is quall to 2s. od. per quart. large tracts of land are planted with the Black C. to supply the liqueur manufactories. It has very reasonally been suggested that the experiment of the introluction of this manufacture should le mate in Scotlind, and even in the: Hebrides and Shetland Islams, where the Black C. perhaps grows as luxuriantly, and bars frnit as abumantly as in any part of the word. - Dany other spewes of $C$, probucing brries sommewhat similar to those of the suceres so extensixely cultivatul, and some of them proh. ably dospring of attention and cultivation, are fonmi in tomperate and cold climates in ahmost al! parts of the world. One with heantiful red brras, larger than the larmest English liend 18

 1.wive athl trained an walle, frolacing in Aprol a profurn of drepprat flowers in large drapung racmen, is a native of the noth-west of America,
amb was introlnced into britain in 1806 . Its bhisb. hack. mueikgineus, insipid berries are met. as is
 (urrum), also a very ornamental shrub, from the same reginas, has a tulular calyx and long golden yellow flowers. Its fruit, which is either yellow or lhack, and of fine tlavour, is not fredy produced in Britail.-The name Native C 6 , or Australian $C^{\circ}$. is given in Australiz to the herries of different shruls, particularly the white berries of Leucopoyon Richei of the natural oriler Epucriducece (1. 1 . v.). The French naturalist liche, who was attached to D'Entrecasteanx's expelition, mainly supported himself on these herries for three days, when he lad becn lust by his compams. Other fruits bearins the same name are prodnced by spccies of Comosmi (rat. ord. C'inchoncued), lut they are very inferior.

CURRANT WINE is made of the juice of red or white currants, to which is athled about one pint of water for every four pints of herries employed. About a pound and a half of sugar is afterwads addel to each pint of the liguor, a little spirits heing generally also adiled, before it is set aside to ferment. A larger quantity uf sugar is sometimes employed, and no water, and a strunger and sweeter $\mathrm{C} . \mathrm{W}$. is thus podned. Fementation requires several weeks, and the wine is not fit for use for at least some months afterwards. Black C. W. is made in the same way from loack currants. hut the fruit is put on the fire in as small a quantity of water as isssible, and heated to the boiling-point before it is mised. C. W.. well made, may fairly challenge CURA with many products of the grape.
CURRANTS, a small kind of raisin (Passulce monores, are the dried rud or the berries of a smallfruitel sedless variety of the common vine, which is cultivated in the East, and especially in Greece. The name is lerived from the city of Carinth, in the neighlourhood of which they were first cultivated. They are very small, round, with a thin skin, withont secils, and very sweet. Those brought from the island of Zante are most estecmed. They are much used by hakers and cooks, entering into the composition of may kinds of cakes, puddings, \&c. They are a principal article of export from Grecce, and the failure of the erop is severely felt in that country; whitst an increase of the price of C . is regarded as a disagrecahle occurrence by the housewives of Britain. C. are simply dried in the sun, on the ground, and then packed into larrels. In a few districts of Crecee, a yery sweet oily wine, called currant wine, is mate from elurrants.

CU'RRENCY means originally the eapacity of leing current, or, as Johuson iletimes it, 'the power of passing from hand to hand.' It is applied in practice to the thing that is so current, and generally to whatever, ly leing current among any nation or class of persons, serves is the money with which they buy emmmorities or pay their delits. It is necessary to be content with a practical explamation, without venturin! on a scientife definition uf the torm, becanse, among the many disputed points in political commy, thare is none productive of more exeiting controversy than the proper regnlation of the 6 and as the alwente of each theny is apt to delime the term in the manner bast suitel to scrve lis uwn ultimate conclusions, his adversaries sumerally duy that his definition is sound. Whether corroctly or not, it is applied in practien to everything that is received for paymont, it diflers from the word money, in its comral acepptation, in as far is it expresses only that which passes as money at same time or place refored to. The leading question anong political commonsts regarding $\because$ is, how far it should be

## CUIREENTS-CURSE OF SCOTLAND.

restrained. The most fficetual mothod of restraininy it is by condining it to the preaims metals. If it were law that none but a mila ( $"$. should ho used in any country, and if, at the same time, there were no eflort to tamper with this grold C., and give it an artilicial value, the $U$ of that country wowid keep its valne all the worlh ower, because it has been paid for in commodities, and will he sold again whenever it is in excess of the needs of those who, use it. lout for this very reason, it is a very expensive C., and therefore, erere since man's ingenoity was turned to trade, mothods have leen devised for sulerseding gold or the wther preeions metals by something cleaper. Uuless, however, law or custom intervenes to give it efficiency, this cheaper material will only be worth its own intrinsic value. A tivepannd Bank of England note is worth so little in its intrinsic value as a picture umen thin paper, that such a value can hardly be expressed. It derives its power as C . from the obligation it fixes on a great rich eorporation to make good its professed amount to the holder. We thus pass from a purely bultion C. to the next step of restraint, which is generally called a mixed eurrency. Itere some maintain that no note should be issued unless the banker or other person issuing it has in his possession as much bullion as will pay it. Others say it is suflicient that he is bomul to pay its amoint in bullion on demand withont his actially possessing the bullion throughout the whole period of the 1 : of the note. A thiri party, again, are for a $C$. eutirely free of a metallic basis; they huld that naturally paper-money, passing from hand to hand, will represent transactions, and will therefore come in the end to be made good in some shape or other ; and they further hold, that if some losses should thus occur, these will be more than compensated hy the rapid increase of trade and caterpise, eansed lyy a free trade in C., as it is termed-that is to say, by every man issuing his own notes or momises to pay to whoever will take them. This list and extreme class of 'currency doctors,' as they have been termed, have lately been losing intuence, and disappearing from the contest. Throngh a succes. sion of practieal measures, reached with consinlerable caution, the English have come to a mixed C., resting on a compromise between the two chasses of mixed $C$. above reforsed to. In the theory of the measures brought to eompletion nader sir Robert Peel in 1844, it is admitted that, to a certain extent, a C. ean be based on transactions and the property of those concerned in them, but that a limit mast be drawn, to prevent the power of creating such a C. from running to excess, by the issue of notes which cannot he immodiately made good by those who issue them. Accordingly, the several banks in existence were allowed to continue their note circulation, but they were yermitted to increase it only on the condition of having bullion in their coffers to pray the alditional notes issued by thera. A C . which is not bullion, and is not worth its nominal value in bullion, is called a 'depreciated elurency.' Before the resumpition of eash payments, the notes of the Bank of England had sunk to be worth but l6s. in the pound, as compared with golet. A depreciated C. may be created by a government calling notes or any other form of money a legal standard, and issuing a greater quantity of them than the real transactions of the country and the Property passing from hand to hand require ; or it may be created hy private persons acting under lavis by which the riglit of issuing a $C$. is not duly limited. This faculty which a U. has of being depreciated without being repudiated, is the real source of danger in all proposals for an unfettered C., or a free trade in the issue of money. If the
 obtaincel were repuliater, theme might be a natural check on over-issures; Lat it is their mature on acenme of the diftienlty of getting hallion fur them, or the chance that it may mowe be gont, that they pass at a discomat or reduction of their value. 11 ensia such a C. wonki be ever shifting; there wonld be nu permanent standard, and the jerson inenryiny a delat before a drpreciation which he pays after waids would, in reality, be paying his crediter a dividemi miny. A depreciated (\%, however, is useful for small transactions. In the silver ${ }^{\circ}$. of this comatry, a poum is worth hitle more than four-tifths of is sovercign. If a person due ellof could pay it in silver, he womld get off with a dividend of from las. to 1ss. in the pound ; but ly law, silver is not a legal tenter for mure than 40 o. The cunper $\therefore$ is so far below its real whene, that it has not been thonght worth while to give it a permanent weight -rence and halfpence have just been issued little more than half the weight of those of former mintages; but they are only used as a medum for small sums, and the royal stamp is sutheient to establish a reliance on them.

## CU'RRENTA. Sce Gelf Streant, Tides.

CU'RRIE, De Janes, best known for his malnable edition of Burns's works, lung the basis of all subsequent editions, was born in Dumfriesshire, May 31, 1756. Ite was at tirst educated for a mercantile life, but afterwaris stndied medicine at bilinhurgh University; and settling in Liverpool in 175l, soon ubtained a grod practice. lle contributem some excellent papers to medical jommals, but has chacf work in connection with his profersom was, Mrdent Reports on the Efficts of I'aler, Cold and H'arm. "A a lemerly in Febrile Diserse, the recommembations in which work have been followed with much suecess. The edition of birns (introdnced hy a criticism no his writmes), which le malertork solely for the benefit of the wiluw and children of the pret, was mblished in 1500, and rahised tilfu0. C. died Augnst 3I, 1805.

CU'RRY-COMB. A lind of serajer used for alressing horses. It consists of a mumber of irom plates notched on one colge to form rumg teeth. These plates are fastenel in parallel luns to an iron back, to which a iande is attarhed, and the horse is 'curied' by scrublung with the tpeth.

## CURRyiNG. See Leather.

CURRY POWDER, or CURPY PASTE, is a compound of tumeric and varuns spices; it is used to a large extent in India and elsewhere as a seasoning for a variety of dishes. Une of the hest receits for the componnding of C. $I^{\prime}$. is, turmeric poweler, 6 oz ; coriander seed 1 wowder, $S$ oz. ; Llach
 cayenne pepper $\frac{1}{2} \mathrm{uz}$; cummin seet, $\frac{1}{2}$ oz. Another process is to mix turmerie powder, 5 oz.; coriander seed powder, 3 oz., : black prepuer, 1 oz. ; ginger, 1 oz ; eayenne pelper, 1 oz.; scorchel mustard, 2 oz.; mace, $\Omega$ drachms. And a third variety is olitained from turmeric powier, 8 oz ; coriander seed powder, 4 oz. : black pepper, 1 oz ; cayenne pelper, 1 oz ; scorchel mustarl, $\frac{1}{2}$ oz ; mace, 1 drachm; einnamon, I frachm; cardamoms, $\geq$ drachms.

CURSE OF SCOTLAND, a term apmied to the nine of diamonds in a pack of phaymy carls. Nuch uncertainty prevails respecting the origin of this phrase. The most probable explanation is, that it refers to the detestation entertained in Scutland towards John Dalrymple, tirst Earl of Stair, on account of his concern in the Alassacre of Glencoe, and for which lae had to resign office, 1695. The heraldic bearing of this jersonage was 'or, on a

## CURSING-CURVE.

saltire aznere, nine lozenges of the field.' These nine luzenges resembe the mine of diamonds, and bence the IMpular phrase, the curse of Sotlanl.

## CURALNG. Nee lechytathon, swearing.

C $\mathrm{C}^{\prime}$ ATAMN, in Fortification, is the portion of rampart or wall between two hastions or two gates. In a regular siege, to latter down the ( 6 . is one of the man operations depended on: and many of the external works eonstrmeted by the defenders are intended $t=$ frustrate, on at least embarrass, this operation. In the amexer cut, which shews a ground-plan of some of the clements of a regular fortification, $\mathrm{FF}^{\prime}$ is the curtum: $\mathrm{Il} \AA \mathrm{EF}^{3}$, a bestion. The component parts of the lastion are thus desighated: $1 / 1$ and AE , two frace: EN and Gll, two Henks: A, the salient: 'PG, the gorge: and II and E , the shonlders. $m n$ is the rempurt; mo, the

A mong monern editions may be mentionel Miitzell's (Berlin, 1841) and Zumpt's (Lrunswick, 1s49).

CU'RUATURE. The C . of a lane curve at a pint is its tendency to depart from a tangent to the curve at that pint. In the circle, this tendency is the same throurhont, for the curve is perfectly symmetrical romm its centre: in other words, the C. of a circle is constant. In difterent circles, the $C$. is inversely as the radins
-j. e., it diminishes as
the radius mereases. The reciprocal of the adius is accorlingly assumed as the measure of C . of a circle. A straight line, which has no C., may
 le eonsidered part of a circle whose radius equals intinity as the reciprocal of infinity, measures the ('., and is $=0$. The annexed fir, shews how the circle of smaller radius bumb mure rapidly away from the tangent than that of larger ralins.

The ennstancy of C. in the eircle suggests an ahsulute nueasure of C . at any point in any wher aure: fow whaterer be the C. at that $p^{\text {wint, we can alwass find a eircle of }}$ the same curvature. The radius of the circle which has the same ('. at any point in a curve as the curve itself at that point, is called the radius of $C$. of the curve for that point: and the circle itself is called the sschlutiny circle. If we know the radius of C. If a curve at ditlerent points, we can compare its C. at those puints. We have thus the means also of comprang degrees of C. in rifferent curses.
parapet on the rampart: QPQ' the rlitch; NO, the 1 covertuoy: liWli', the ghecix; KLL', a revelin.

C'tilitlles. Mettes on Mettrs, a molle limman gouth who (acenerling to tradution) heroieally sateridied his life for the welfare of lis cometry, 862 nec. A cham, it is said, hasl numed in the fumm or market-place in lime, and the southsayers 1 redicten that some great calamity would lappen if there were mut thrown into the chasm the foest wealth of the state. While it was properl to eonsult the maeles, and determine what this lest wealth comld be. C. appared on horseback and in full armorme, ami exclamed: 'Rome has no greater riches than eourage and arms.' He then role ofer the precipice into the chasm, which inmediately ehosed over hmo.

CfRTIUS, Refes Qristes, a leman listorian. author of the work be Ifehes (iestis Alracembit Wount, in ten books, of which the tirst two have heren lost, anel tha" text of the remainder has cone duwn to us in a damaged condition. Gwat dalfernees of ofinion have existed with regard to the time in wheh $1:$ wrote, for his nome is first mentioned ly writers after the 1 lla contury.  crabim: bence his work is for fromberne relialde

The prohlem of measuring the $r$. of a eurve at any point is the same, then, with that of finding its radins of curvature. In some simple cases, as in the conic sections, this may be done geometrically ; it is usually necessary; however, to employ the calculus. If the curse he referred to rectangular co-orinates, and $a, y$ be a point in it, then it can be shewn that radius of $C^{\prime} \cdot=\frac{\left(1+\frac{d y^{2}}{d x^{2}}\right)^{\frac{3}{2}}}{}$.

$$
\frac{d y}{d x^{3}}
$$

curved line, instead of being phane, twists in space, it is called a curse of donhle curvature. See Costact and Oicelimive Cobele.

CIRYE means, in common language, a erouked han that depurts gradually from the straight direetiom: in mathomaties, lowerer, it is usually restricted tw lines that follow sume law in their Thange of direction. Thus, the law of the eirele is, that ath pints of it are cepually distant from a fixed pwint, callol the centre. The law of a plane curve is gonerally wpressen loy an erpation letween the co-wrinates of any puint in it refored to a lixed puint. Sew comemsures When the equation of a curre contans only powers of ond $y$, the eurve is alformair: when the "fuation contains other fhathons, lenarithms, fur instanes, of at and $y$, the cure is callial transecmbutal. 'The eycloid, c.g. is a transemental curve.

Theme are also curvers, like the spiral, that do not contimas in me plane these are called curves of domble curvature 'low expess the law of such a rime mpures thre⿻ emondimates and two epuattims. C'insens ate said to be of the first, secom,

31
which the tenure is expressed to be according to the custom of the manor, without adding the words 'at the will of the lord.'

CUSTOM HOUSE, the office at a seaport where the customs duties (see next article) are paid, yessels entered and cleared, \&c. The several cnston houses in the United Kinglom hare each a separate establishment of officers, according to the extent of the trade in the port to which it belongs, and the consequent exireacies of the service. The whole are, however, under the control of the Commissioners of customs. The salaries of the various offices, and other details of the service, will be found in Parkinson's Cnder Government; Bell and Daldy, 1559.

CUSTOAS DUTIES, the portion of the revenue of the United Kinglon terived from a tax on imports. The origin of the term is connected with the long contliet letween the crown and parliament as to the right of taxation. To meet the claims mate ly the Clouse of Commons of the exclusive right to vote all supplies, it used to be maintained that there were certain duties on exportation and on impartation to which the crown had acpuired a right by custom, and after the fower of parliament nver this loranch of taxation hat been fully established, it retained its ohl uame. This tax, after the excise came in force, was always applicable distinctively to goods changing place. There were customs not only upon things leaving and things coming to the British dominions, but also upon commodities transferred from one part to another. In Scotland, the duty on commodities imported into any town from a forelign conntry was called the great custom; and the duty charged by a burghal corporation on comnoditics coming from the country districts within its walls was called the small or petty customs. At present, the term C. D. aplies solely to the tax levied on commolities imported from abroal, thus facilitating a convenient division of the sources of the British revenue into the Customs and the Inland lievenue, the latter inclnding all other taxes.
The tax on imports was of old a simple percentare, familiarly known to the readers of English history as 'tonnage and pmundage,' from the method in which it was adjusted to heary and light gools. Subsequently, however, the notion prevailed that the (. 1). might not only be a source of revenue, but an instrument for furthering the rarions theorics about potecting this trade and discomaging that, which prevailed from time to time. When it was hed as an established principle, with regard to any trade, that the customs should be arjusted in such a manner as either to aid or to impeale it, the regulations regarding that trade alone would have complexity enomg for a whole conde of custons laws, the object of which was mere revenue. The more complax the arrangements, the more "pen wre they to the machinations of the smurgler ur aleframier, and comsequently regulation had tole ahded to regulation, till the whole became a chans. In sume instances, the intios were such as tonct an a prohibition to importation ; in others, merely as a havy increase on the price. In cither ease, there womld low relaxations in favour of the prohuct of our usn colduing, and perhaps of some favoured comntry with which we had a treaty of recipmocity. Then, to concourage our own trade and mamufactures, it was monsidered politic to allow goomls to low imported fur exprotation abroad, or to We impurtad for the purpose of being worked up, into a manufacture, amd there wond lie a diflerence latwern the extent of encomagement granted to that manufactur", if it were for home consumption
or for exportation. 'The mothond in which such relaxation was acemplishel was at timet by charging the duty on the impurtation, ami afterwamla repaying it lyy what was callem a 'frawlack;' anet this was sulseepuently aceomplished in an aniop method for the importer, lyy alowing han to 'bome' the goods in the governmont warehonses until the duty Was paid, or the conditions which dispensed with it fultilled. See Wambotsing sistma.

In the year 1805, the laws of the liritish customs were comsolidated into "leven acts of pardiament the froit of the exertoms of the late Mr hatem llame. It will give ar conception of the confased and combersone condition into which the systom had merged, to mote that the nmmer of acts reperaled on the recasion of the consolidation was 4 li, anl it was afterwards discosered that several had been omitterl. There was still a lomg list of C. D., many of them intended for purposes beyond the mere collaction of revenue; lut the free-trade legislation of 1846 chared away a preat mass of this burden on the commere of the country, and almost every year has comtrilnited to the abbreviation of the list of Inties or Taritl (q. v.). Thns simplitied and remeen, the C. D. supply an enormous monnt of revenue. The tatal receipts of the linitish revenat: for the year 1860 were $271,967,194,11 \mathrm{~s}$. 92, , ams to this

The defects which, recording to the dinetrines now prevalent in this comotry, are to be ayoded in a coule of customs, are-- 1 . The prohblition w disenuragement of the importation of usefnl conmotities; $\because$. Encouragement to the smughler ; aml 3. Loss of revenue by raising the duty to the luight which discourages mportation. Uneler the first head, sce Anticondraw Leacue, Cohen Laws, and Fiefe-trade. The second is comnected with the view that on stimulants the duty camuot he too high, even though it should greatly imperte their importation-the daty on tubace is, in some instances, as high as 900 per cent. on the valne of the article. But then, if the smuggling trade be encouraged, the stimulant is not only obtained without any contribution to the revenie, but the people become demoralised, and trained to crime. Under the third head, a memorable example is furnished by the sugar-inties of Vrance, which were so high that the mative auriculturists conh make sugar from beet-rout a little cheaper than the duty-paid forcign sugar. Itence the article wats de:lr, for hat it not leen for the hejght of the thaty, it would nut have been worth while to make it at home, and at the same time there arose little or no revente from it.
The cullection and general management of the C. D., which used to be divided among several loweds, is now under one great centrad department of the government in Lomion. It comsists of a chairman, dejnty-chairman, four commissimers, a seeretary, an assistant-secretary, and a statf of suborlinate oficere.

CUSTOS ROTLLO'RUM (Lat, keeper of the rotuli or rolls), one of the justicess of the peace of in county apprinted by the crown to keep the comenty recorls.

## CUSTRIN゙. Sue liéstax.

CUTCLI, a protacted principality under the presilency of Bumbay, stretehes abong the gulf of its "wu name and the Indian Gean betwein Guzerat and smile: It extents in N. Lat. from o2s 4,5 to $\because 4^{*}$ f1), and in E. long from $68^{\circ} 20^{\prime}$ to $71^{\circ} 45^{\circ}$, contaming, in something of a trianglar form with the maritime lme as a base, an area of lobibe separe males, and a fupulation of rather mene than half a million, It is divided naturally into C'. I'roper axd

 hituts, is the lelt on the simathore, tomehing simon, of which it may be panarded as a , inysical contimuttion, on the burth-wat, and beomg separatud by a letathed portion of the Rame from Gimarat on thes senth-east. While tha smatheme edge of this belt is mernly a samly dusit, the morthern section, trabersed lenethwise by two prallel ranges of hills, presents, amm much sterility, many fortile tracts, Whind yioh cottun, riee, \&ee, and foed a larae stome of lorsiss, kine, baffaloes, and camels. 'The mand defect of the comintry is the searcity of water. Hence the erops oerasionally fail from the seantiness of irrigation: ant] at this monent, in March 1sfis, thas remon is san to be suffering mare sively than amost any other in Judia from a mondy general famine. Timber is scarce, for the mowth in the momutains is chiefly brushwork. Here amel there, however, decayed tranks of great sikn, mome pretienlarly on the sunthern rilge, inficate the former existence of noble forests. The mineral productions are eral, irom, ame alum. The taters of volcanie action are numerous. Eartlupakes also have recuntly ocurred; one of which, in July 1sin, besides shakine every furtiticatmon to its fomdations, and destroying seseral hambeds of perple, threw up an enommons mom of carth amd same many miles in extent, and simaltaneonsly snlmerged an aljacent district of comespondiny side.
 and the military force comsists exehsively of a buly of irrenular eavalry. The ruler is stylad the limo; and the femiatory chieftains mader him are almut
 smaller, of 1600 square miles, on the east, and the larger, of fono square miles, on the morth-is merely an amphibinus desert, being, in a great measure, hard gromel chring the dry seasom, anit then, in turn, a sort of shallow lake fomed by the heary rams and pent-np, tieles of the south-west monsom. It is supposed to have been orifinally a furmanent inlet of the ocean, and to have had its lusel rased loy some snch convulsion of nature as that which mankel the year 1s1! . The perionical disappenrance of the waters leaves behind it one enatinums crost of salt, This hreary waste, however, is nut wathont its elevated syonts, the islets, donlotless, of a $r$ muter era. bint, with the exception of herils of asses am! cleurs uf thes, animal life aphears to be nearly unknown.

CU"THIBERT, Si, of Deminam, on , if the threc areat saints of lengland in the mulle ares, the ither two beines sit Eilmum of Eilmmalshey, amb St Themats-it- letelet of Cianteaburs. St C. was Lurn about 635. Nether his lonthplace nar his parentare las bemascertimet; but a lecomb, whath was lone wemerally bebeven, toht that he was baru on lrelanh, and drew has lineare from one of the inety kimes of that commers. Whon the halit of recori tirst falls num hom, he is a sheplemi hoy in
 northwarss th the forth. In cith, whe wate hang lus flock by night on the hejohts of hamberlale, be holieves that he sees the heavens "pen, and a comprany of annels desecme mon the earth, and again ascemi to heaven, carrsine wath them the sonl of St Adan, the phon Bi-hop of limdisiane, or Iloly 1sland. The rision intermines him to lecome a monk, and in the same year he enters the monastery of Melruse, ai whath st buish was then prownst or prior, and st lata, ahbot. When the latter remonal to the newly-tomand monastery of liann, it $\because$ acenmpand hm, ami was amointerl the the othec of sulpuntumbent of the funts. la bibl, ot limsol dued of the flague, which then ravaged Britaim,
and st C'. was chosen to succeed him as prowst or prior of Alelrose. White in this office, he distingrished himself by his nssiduity in visiting the neighloming rillages, and especially the remnter numatain hamlets, snmetimes on horsebaek, that oftener on foot, and labouring ly his teathing aud example to reelam the peonde from the superstitions or payan rites into which they lad fallen. After a few years spent in this way, he left Melrose for the ishand monastery of lindisfarne. of which lue heeane prowst or prior, his ohl master, it Eata, being about. Longing for an ansterer life even than the mourstic, he quitted Lindisfarme in 6.6 , to becone an anchorite, or solitary rechase, in a lat which he built with his own hands on Farme lsland. Here, in 68t, he was risited by Degricl, king of Northumbria, 'Trumuine, ex-hishm of the licts, and wher grat men of the north, who came at the remest of the synod of Twyford to entreat that he would aceep the hishopic of 1 fexham. He rehuctantly complies with their wishos, lant his heart is stall with lis Noxthmorian islamis. Me exchanges the see of Hexham for that of Lindisfarne, and still thinsting after solitude, at the end of two years he resigns his hishopric, and returns to his hat in Farne Sland. Here he died on the oth of Mareh 657. The amiversary of his death was a great festival in the Engish Church. which emmemoratul also the 4th of Nopitember, its the anniversary of the day on which his hooly was translated to Durhan. The influence which ist C. exereised apm his age seems to have been due chietly to his fervent piety and extraodinary asecticiom. The gift of a persuasive tongue is ascribed to lim, and he would seem to have had skill and pratence in the mangenent of aftirs, lont nowhere is there any trace of his learning.
The fane of st C . had hem great durimg his life: it became far sreater aiter his death. 'hnoches were dedicatecl to hin thronghont all the wide comotry betwen the Trent and Mersey on the smath, and the Forth and (lyyde on the north. When lis tomb was ipenen at the end of eleven years, it was beliesed that his lonly was fomm incirmit. and sto for more than soo vears, it was luliuvell still to contime. It remainal at Lindisfarme till $5 \%$, when the monks. bearing it on them shanders, thed inland from the fary of the Wanes. Ster many wanderinns through the somth of roatlind and the north of Englam, it fomm a resting-place at Chester-le-sitrent in $65 \%$. It was transfered to lipmin in 90 , and in the same year it was removed to Durlian. Here, enchesed in a costly shrine, and believed to work haily mirnelea, it remained till the leformatim, when it was laried mader the paroment of the cathedral. The grave was opencl in 15:7, when a cothin, asecrtainal to have been made in 1.51 when the buly was committed to the earth--was fomme to enclive another, whiel there was reason tos sumpis had been made in 1104; :mm this agan anchasen a third, wheh answered the description of one male in 698, when the satint was ratsed from his first grase. This immost case comtamel, nut, indeal, the incompitile buly of St C , hat his skeletan, still entire, wraj?ed in tive rohes of submideres silk. Frasments of these, anl of the piserpal sestmonts, tongother with a monb ami wher rolies, fomm beside the buncs, ar" of 1re seen in the whendrat library. The ascetheism which dis-
 Cintil the lieformatim, no wemen was sullered to apprath his shmone the cross of hate mathe still umaint in the eathentral flow which matked tha

 from the afleminal saint. In wo wath, at was lecheved,
was equally prompt to avenge every injury to the homonr or pessessions of his church. It was trald that William the Conqueror, anxions to see the incorrupt boly of the saint, ordered the shrine to tre broken up; hat scarcely han a struke been struck, when such sickness and terror fell upon the king, that he rushed from the cathedral, and, monnting his horse, never drew bridle till he had crassed the Tees. A cloth, said to bave been usel ly st 1 '. in celebrating mass, was fashionert into a standard, which was believed to insure vactory to the army in whose ranks it was carried. Flodden was only one of many hields in which the defeat of the Scots was ascribed to the banner of st C'uthbert. It hung beside his shrine motil the loformation, when it is sam to have been burnt by Calvin's sister, the wife of the first Protestant dean of the cathedral.

The life of st ". was twice written by the Yenerahbe thede-mionly in vigerons hexameters in his Litur de Momentis Sundi ('uthborchti bipiscopi; at greater leugth, in prose, in his Liber ale lita, $t$ Miraculis Suncti Culbercti Limpivfumensis Episconi. In this latter mork, he made use of an earlier life by a monk of lindisfarme, which is still preserved. liesides these lives-all of which have been printed more than once-and what is told of St C. in Bede's Mistorin Liclesiasticu Gientis Anf/orum, the ehief anciont anthorities are the Mistoria Translationis S. Cuthberle, poblished by the bollandists in the Acta sianctorum, mons. Mertii. vol. iii.; the Libellus We Erordio Dunhelmensis Ecclesie by Symeon of Durham; the Libellus de Xativitute s. Cuthberti de Historias Mybernensium crecrpus, and the Libellus de Acmirundis B. Guthberti Iirtutibus, ly Reginald of Durham, both published by the surtees Sciciety. There are two modern memoirs of St C.- the late liev. James Raine's N't Cuthbut (Durham, IS2s), and the Very liev. Monsignor C. Fyre's Mistory of St ('uthbut (Lond. IS 19).

CUTIDBERT, a disciple of the Venerable Bede in the monastery of Jarrens, of which he limself was afterwards ahhot, was present at the death of his master in 7:3 , and has left a beantifud and touching rolation of the event in a letter to his fellow-disciphe, "nthwine. It bas been often printed: the best editions are those in Twysden's Decme scriptores (Lond. 162O), and in Stevensm's etition of Bede’s Mistorin Ecclosiestira (Lond. IS38).

OUTHBERT OF CANTERBURY, a native of the kingdon of Mercia. hecame Bishop of Moreford in 736, and Arehbishop of Cantermary in 7.4. He died in 7.5s. An instructive letter was aharssonl to him ley st bonifiace (or Winfrit) on the evelesiastical alonses of the age. 1t hats been printed more than ance, and will be fund in the inpemax tor the late l'rufessor llassers's adition of Hedes Mintorit Bedtsinstien (1)xon. 1 Stis).

(Gool tuble-knieres are made of steel and imon welled together: the tans, which eress into the handle, and the shomler, are of iron, and the Jhate of steel. The tang and shomder are forged from loariron, int the blade from shear or cast steel. Kinfeblades, razor-blades, and othor small articles, are usually forgerl into their required shape while still attached to the bar, which serves for the workmen to link them liy, and is called the 'prorter.' When the har hecomes too short, it is graspeal in a pair of tomers helel close by a rine which clamps them by slibing up their conical hameles. Two men are employed in forging such work, wheh is saill to be 'two-handed.' 'The principal workman, or 'tireman,' uses a small hammer of 2 to 4 llos. weight, while the - hammerman' wields the sledie-linmater, weinhiuer from 10 to 55 Hes. 'The 'fireman,' whon attenis the heating as well as the anvil-work, directs the hammerman, whose blows merely follow those of the small directing hammer of the fireman. In flrouting down or reducing a bur beth in lemerth and wielth, the Hat face of the hanmer is nsed; brat when the lenntly or breadth alone is to lie extomed, only the 'pane" or narrove elge of the bammer. 'The coneavity of mazor-blades is made ly liammering the blade on a small rounl-faced anvil; the notely or "nail-lale" of a penknife is struck by meams of a chisel of the tepured form. Suprior work, such as razor-blades, are smithed after forging-that is, heaten uron an anvil, to comlense the metal as much as posibleant slichtly gronad or seorched on a remgli stome, to tinish the shaping, and remove the "seale' or black oxidised surface, which wouk interfere with the colour of the tempering. Common linives aremak entirely of irm, and the difarence of price arises not merely from the difference of cost of the material, lint from the meater facility of workime it slowld also be understome that, in many articles composed of sterl Wehled to irom, the savine of sterel is not the only alvantage, fur steel lemig more

Some herbaceons plants are proparatel by C., which, in piuks and carnations, are called pipings.

CU'TTLE-FISH (Sepia and Sepiada), a genns and family of cephaloprodous molluses of the order Dibranchiato. See Cephalopoda. The body is oblong and defressed, sac-like, with two marrow lateral fins of similar substance with the mantle. There is an intermal shell lodged in a sac on the back part of the mantle, somewhat oval and bladeshaped, leing comparatively thick near the anterior end, where it is terminated by a sharp point affixed, as it were, to its general outliue; the whole shell is light and perous; it is formed of thin plates with intervening spaces divited by immmerahle partitions; anit consists chiefly of carbonate of lime with a little gelatinous and other animal mattor, which is most ahmortant in the phragmocone, or interial harder part of the shell, where also the lamime and partitions are closer than in the onter part. The eyes are very large, and the head is furnished with elght arms, each of which has four rows of suckers, and two long tentacles expanded and furnished with suckers on one sile at the extrenity. The

Cuttle-fish. Common C. (Sepia officinalis) is ahmedant on the British coasts. Its skin is smooth, whitish, and dotted with red. It attains the length of a foot or morc. It is one of the lests of fishermen; often, along with calamaries, partially devouring the fish which have been caught in their nets. In Scotland, the fishermen call it the 0 fisl. It is not itself easily caught, being very acture in making its escape by swimming, and also prumptly throwing out its ink to darken the water aroum it. It is sometimes cast upon the shore, but far more frequently its bone, which is used for maling ponnce, tooth-powder, \&e, for forming monlds for small silver castings, for polishing, and for other purposes in the arts; and was fommerly often used in modicine as a corrective of acidity in the stomach, for which purpose, however, it is no better alapted than any cther form of carbonate of lime. The ink of the C. furnishes the valuable pisment called sequa (! 5 . ), which is said by sume clumists to contain a peculiar animal principle called Molunine (Gir. mhtes, black), and is wimberfully imbestractilde. Ir lineklind indeed fund the pigment romaining in fossil molluses ak in

The thesh of the C. was
esteemed by the ancients. A receipt for makines a C. sansage will be fomd in Athenatus. - Numerons speciers of C. inhalit different seas.

CUVIER, Georare Chintues 1 , fopord Dasoment, Baron, was born August 23, 1769, at Mmmpulyarl, a town then blonging to Wiotmburs. but now to France. Ifis father was an ofticer in a siwiss regiment. Itaving made rapiul progress in fearning at the Mömpelyard gymasium, C. caterea, in 1784, the liansakalomie at stutgart. II re, in the midst of various studics, he retained that predilection for natural history which he had disjliaged when only twolve years wh. The restricted means of his parents, lowever, compellent him, in 1788. to take a sitnation as private tutor in the family of Comte d'lléricy, who resided near l'écamp, in Normandy. Here 0 . lived for six vears, quietly but ceaselessly pursuing his studies in natural history. An acquantance aecidentally formet between him and the Abhe Tessier (noted as a writer on agriculture), was the canse of C.'s obtaining an introluction to, Geoffroy st IIilaire and other eminent Parisian savans. Startled ly the novelty and comprehensiveness of his views on zoology, Geoffroy st llilaive urged him to come to Paris, which he dist, and, in 1795, was appointed professor in the Ecale Centrate of the lanthem. Soon after this appintment, (. was made assistant to Mertrul, the teacher in comparative anatomy at the Jardin des Plantes, and now he heram to form that collection in natural history which ultimately became the largest in Earope. In 1796, he was made a member of the National Institute; in 1800, he succeeded Dauhenton in the College de I'rance; and, in 150, was made perpetual Secretary of the institute. He gradually rose in the estimation of the Emperor, and, in 18U8, was commissinnel to superintend the institution of acallmies in the now territories attacked to France. Shortly before the fall of Napoleon, C. was admoitted iuto the Council of State. The liestoration did not deprive him of his honours, but addel to thera; he was mate Chancellor of the University of Paris, and, benceforward, received from time to time new rewards for his services to science. After a visit to lingland (1818), where be was receivel with great honours, be was, in 1s19, almitted into the calninet by Lonis SVIII., and, in 1826 , was made Grand Otheer of the legion of Honour ; but his decided opposition to the royal measures for restricting the frectom of the press, lost him the favour of Charles X . Under Lowis Philippe, he was made a peer of France in IS31, and in the following year was nominated Minister of the lnterior, when he was suddenly attacked with paralysis, of which he dien, Alay 13, 1832.

It is diffeult, in our narrow compass, to give a summary of the merits of $C$., so varions were his attamments, so great was his success in su many departments. He laid the foundation of the now miversally recognised methal of elassification in Zoology ( $q . v$. ), and raised comparative anatomy (which until his time had been merely a heap of macomnected details) to the digmity of a seience. After a long series of patient observations on numerons animals, especially the hitherto littleNinwn order of mollusea, he pulbished (1801-180.a) his Lerons id Anatomie Comparée, which was completed by the Mimoire pour servir à l'Mintoire de CAuatomie des Mollusques (1816). With admirable sagacity, he aplien the principles of his Comparave Osteoloyy to the remains of fossil vertelorate animals, and thus opened a tield of investigation in which mumerous explorers have since successfully laboured. His Recherches sur les Ossements Possiles des Quadrupides ( $18: 1-182-1$ ) is a mine of infor-
mation in nataral history, amd afforls the strongost arguments in faverr of the therery of a progress sive seriss of mamala, solvaneing from the most mimple to the most complax forms of argumisation. $\because \because$ raw faculty of exprossmg sciontuic: truthis in a popmlar iand "legant styly, was dixplayed in his celelorated Jiscours sur le's hervelutions ite les Surjue. du bilobe ot sur les fibungromots quidthas ont

 ments Fussilis. In concerst whth Valunciomes, ${ }^{\circ}$.,
 wheh was foumberl on the largent inhthyolughend collection ever mule by an milumbal. It was continued by Valencionnes. Lastly, wo may matiee the doges delivered by C. (and gmblished in the Rerupil d'Eloges Mistorigues, 181:9, as valuable eontribations to the history of science.
In puldic life, 6 . was as remarkalle for activity ns in the quict work of the study. He never lmaily surrendered himself to any party, lout at all tumes gave proof of an honest, sagacions, and resulute character. In his plans for the extension aml improwement of national chucation, he was zealous and indefaticable, as also in his eflorts for the welfare of the Frotestant Chareh in France, of which he was a menulner.-Mrs li. lece's Memoirs of
 (1'aris, 1833).

CUNILA'VEN, a town of Cemmany, sitnated on the left ur southern Lank of the Elloe, just where it is lost in the German Ocean. It is abont (i) miles distant from Lamburg, to which free city it helongs. C. is a small place, hut of importance as the port from whence the Hamburg steamers Hy when in winter the Elbe is frozen over. 'I'he harbour affords yood shelter, and is much resorted to by vessels waiting for favourable winds. Induts for the Elhe are taken in here. Fop. levt.

CUYA'BA, carital of Matto Grosso, the largest and most westerly province of Brazil, occnines pretty nearly the centre of South America, limg in lat. $155^{\circ} 36^{\circ} \mathrm{S}$, and long. $56^{\circ} \mathrm{W}$. It stands "n the loft hank of a river of the same mame, and is estimated to contain about 10,000 imhaliatants. Its comarea, which numbers $\mathbf{0 5}, 000$ inhalntints, has yieded gold and diamonds since $171!$. In ablition to these precious commodities. $C$. sends to lio, the principal seaport of the country lage quantities of hides and ipecacuanha dy caravans of 200 or 300 mules each. The chice eilifices of the city are its three churches, an hospital. a schoch of philusophy, and the Iublic builimys of the provace.

CUYP, or KUYY, Jacor (iermitse crmmonly called the Old C., was bom at Dondrecht in 1035. Jacob C's representation of cows and sherp, hattles aurl encampments, are elever, hat his fame rests principally upon his excellent pontraits. His colouring is warm and transpurent: lis manner, free and spirited. 1\% died in 1650.-Aelbelit étyp Jacol's son, was also borm at lomdrecht. in 1605. He excelled in the painting of cattle grazing or reposing, mooulights, wintry landseares, still waturs with shijs, horse-markots, hunts, camps, and cavalry-tights. Buriny his lifetime and long after, Aclbert's pictures, although in many respects cymal to those "if claude, were helel in little estimation. Opinion, however, bas now changed regarding them. One of his still waters, which was soll in $1: 75$ for 416 cminers ( 634,13 s. 4 $/ 2$ ) brought 12,200 guildars (El0G0) in 1st4. Englame is particularly rich in his works. He lied at Dordrecht, 1691. - lienjams Ceyr, a neplew of Aclbert, lived at Hordrecht, aud painted biblical preces in Iicmbrandt's style, and
familiar scenes of country-life. His best works are in the maner of Teniers. His sea-shores have less repute. The dates of his hirth ant , leath are unkuown, bat, from the multitude of his pictures, it is conjectureal that he lived to a great age.
( ${ }^{\prime}$ ZCO , the uame of a city, a jrovince, aml a department iu l'erv. $\quad$. $C$, the enty, was origimally the capital of the Incas (in the langrage of the Incas, says Garcilasso, C. siguities "naval') and the centre of an empire, which, besides the territory of the existing republic, comprised Bolisia, most of Ecuator. and portions alsn of "hili and the Argentine Confederation: and is still, next to Lima, the most populons city in the state, containing fully 47,500 inhalitants. It stands on the Guatana, me of the remotest headwaters of the Amaznn, in lat. $13^{\circ} 31^{\prime}$ s., and long. $72^{\circ} ?^{\prime}$ W., occupying the eastem extremity of that section of the Andes which is known as the knut of C'uzco. Notwithstanding its aboriginal name, C , with the exception of some ueighbouring rains, part of which, perhap, carry one hack beyoml the era of the lucas, is really of spansh rigin, being built in the fonm of a syuare, and presenting ruany handsome editices. It is about oon miles to the north-north-east of Arecpuja, having its maritime outlet in Isliay, the port of that city. The manufactures of the place are cottons, woollens, embroidery, and jewellery--.. The province, wherwise stylat the Coreado, cmhaces nothing beymal the city itself but the suburh of san Jeromino.3 The department, sulnlivided into 11 provinces, lies wholly in the sierra or Antine regin of the country, having the coast on the west, and the montana, or Trimsandine territory, on the cast. It numbered, in 1853, , 16,211 inhathinats, heing considerably more poplons than any other department. It stretches in s. lat. from $13^{\circ}$ to 15 , and in W . long. from $70^{\circ}$ to $7: 3$, with an area of ahont tho.000 sefuare miles. In rudition tu ( $\because$. itself, it las the tuwns of Abancay and C'rubamba.

 A+11.
(YANO'sls (Gir. Ryanus, bue), lividity of conplexion, with fulness of the capillaries amb minate veins, especially of the face and lips. A name characteristically applied to the colour in certain cases of congenital disease or malformation of the heart. See Meafit, Diseise avd Malformatios of.

CYA'NOTY1'E PRO'CESSES, in Photogradhy, are those in which the compound radical cyanogen is cmployed; they were discovered by Sir John Herschel, and depend for their successful practice on the reduction of a persalt of iron to the state of protosalt, ly the action of light, in the presence of urganie matter.

Guod paper is immersel in a solution of ammoniocitrate of iron of the strength of 40 grains to 1 ounce of water: it is then dried, and exposel-at any convenicnt time cluring a fortnight-under a negative, wheu a preture of a pale brown tint becomes fantly visible unn a yellow gronul : it is then brushed over with a solution of ferrocyanide of putassium (yellow prussiate of potash), which develops the picture of a deep blue tiut ; and this may be further dcepenel by immersion in a solntion of carbonate of soda, which has the effect, at the same time, of removing the maltercl ammonio-citrate, and permanently fixing the picture. Similar results may be obtained by employing ferrideyande of potassium (red prus. siate of potash), of a mixture of the ferrideyamide and ammonio-citrate, in which latter case the paper is sensitive as soon as treated with the mixed solutions. and must therefore be dried in the dark. To fix the pricture, it is only mecessary to wash with water. I subsequent treatment with a weak solution of proto-nitrate of mereury, has the effect of apparently remoring the whole of the picture. If the mercury salt, however, be perfectly washet away, and the picture dried, and irnod with a very lot iron, it is speedily reproduced in all its vigour.

CYANE R1C ACID is an organic acid allied to cranic acid, and having the formula $\mathrm{C}_{0} \mathrm{~N}_{3} \mathrm{O}_{3}, 3 \mathrm{HO}$, (n) C $_{3} \mathrm{O}_{3}, 31 \mathrm{l}$. It is intained by heating urea to exjel ammonia, or ly the destructive distillation of uric acid.

CYA'Tutes, a genus of Ferns (f.v.), of the sulborder I'ulymentirctr, containing many species, matives of tropical ind sub-tropical regions, both of the Ohd and of the Nuw Wordd. They are tree-ferns, and sonne of thom lave lofty stems and gigantic fronds; they are generally also maracterised ly great gracefulnoss and beanty: Corborea, sometimes designated the Common Tree-fem, is a native of the West lndies, Brazil, \&e. The fromls are bipinnate, the pinnules dogly $p^{\text {immatitht. The ronts of C. motul- }}$ lerin, a surcies fond in New Zealant, contain much stard, and are lakel and used as fuod.

- 'VATHOPlIS'LLUA1, a genas of fossil stony corals, with a simple or brandabl pellyarimo. inter nally lamedated, the lamella haring a guadripartite aramonent. The Mder purtions are ent off by transperse 'tallese' or seplita, and the lase of the stem is often sulderted hy ruot-like processes. This gemus was appecially ahmmant in the Dewomian meathes, sobses having heen described from them. It male its first apmarane in the silurian seat, and perisheal at the clase of the caboniferous (1) $\times \cdots \cdot 1$

OCCLODRANCIIIATA (fir, circle-gilled), an order of gastermodoms molluses, in which the gills usually form a series of tamelle, surroumbing the body lectween the font amb the mantle. To this order letong the unwatre Putulthe, or Jimpets, and the multivalve Chitomide, or Chtons.
CY'CLOID (fir. eirele-like). If a circle roll along a straght line on its own lame, a mint ${ }^{\text {da }}$ the circumference describes a eurve which is called a cycloit. The eurse is one of thu must interestmg we know in respect both of its grometrical properties and comnection with dymamis. One of its most interesting properties is this: The time of a body's descenting from rest from any print in the are of an inverted C. to, the lowest point is the same, from whaterer ${ }^{\text {wond }}$ of the curve the body legins to descem. This is sometimes expressed by saying that the $C$. is the isechomons (fir, equal-time) curec: Tha buly having reached the lowist point, will, through the impetus reerived in the fall, ascend the "中posite hranch of the curve to a height ecyal to that fron which it fell, losing velocity in its ascent hy the same degrees as those ly which it acpured it in its descent, and it will emplay precisely the same time in ascomiing is it dial in descume. ing. It is clear that if a surface could be proeured that would le

The Cyclois. profectly smooth ant hard, the $(:$ would thins present a sulution of the perpetual motion. The curve was discovered liy Gahteo in Itis. The hue AB, which is caller the
base of the cycloid, is equal to the circumference of the generating circle; and CD , which is the axis of the eycloin, is equal to the diameter. In any position EP' of the remerating circle, AE is equal to the are E1'; AQ , the abseiss $=\mathrm{AE}-\mathrm{QE}=$ are $\mathrm{El}^{\prime}-$ sine of EI ; and PQ , the ordinate, $=1-$ cosine of EF.

GYCLOID FISHES, an order of fishes, accoriing to the classification proposed by Agassiz, having cygtuid scales (Gr. kyclos, a vircle)-scales formen of concentric layers, not covered with emamel, and nut spinoms on the margins. Eycloid scales are generally imbricated, hut are sometimes placed side by side without overlapling. Very many of the existing fishes are of the cycloid order, and fossil C. F. are mumerous in the more recent strata from the chalk upwards, but they first appear in the chalk.

## CYCLONLS. Sce Stoms.

CYCLOPEAN ARCHITECTURE, or MLASONliY, the name which has come to be generally used for a wall of large irregular stones, muhwn and uncemented. The term originated in Greece, where structures of this kind were falled to have been the work of the Cyolojes, or one-eyed giants. The walls of Tiryns, near Naupliz-ailuided to by Homer-are an example of the ruler style of Cyclopean masonry. They are of irregntar unshapen stones, from 6 to 9 feet lonq, from 3 to 4 feet wide, and from 2 to 3 feet deep; the interstices are filled nup by sumll stones, hut no mortar is used. The walls of Nycene and of Epirus are examples of more advanced C. A.: here, the blocks, althongh irregular in size and shape, are fitted earefully to each other, shewing close joints and a smooth surface. These structures are now commonly betiesed to have been reared ly the Pelasgi ( $\mathrm{g} . \mathrm{v}$ ), p nobably more than a thonsamd years lefore the Christian era, They are found not only in Crecee, Jut in Italy and Asiat Muor.

The next stage of Cyelopean masonry shews an apruach to horizontal cousces, as in the walls of sereral towns in direce, and of some in Ltruria. Lastly, the name of Cyclon'an work is applicl, lint permps mit inite accurately, to a kind of masomry Which ohtaned among the Litrascans (q. v.), where the blueks are both squaret and laid in horizontal courses, hut are not ecmented. In sume cases-as in the walls of Cosa, in Tuscany, beliered to have leen first a F'elasgian, and then an Etrnscan citythe lower part is of irregular polygmal hocks, the nupur part of squared stones in lomizontal courses. In at least one instance - a wall in the Pelupomesus -a fundation of excellont asblar is surmomet by irregular polygonal blocks of the usual Cyelopean type.

Basunry, partaking more or less fully of the (yelo$1^{\text {wan elnaracter, is to be fund in Persemplis, and rlse- }}$ where in Asia, in several parts of Western Europe, and in some parts of America. CYOLOP'Dida. See Excyclopadia.
CYCLOPLS (Gr. Nuklopes, the round-eyerl'), in Greek mytholugy, are of three kinds. I. The Homeric ©., a wild, lawless, gigantic race inhalit. ing the sea coasts of Sicily, the most prominent of whom is I'blyphemus (I. v.). Although Homer dens not directly call them one-eyed, yet he expressly terms Polyphemus such, and the later poets attriInte his peculiarity to the rest. 2 . The three (: mentioned by Hesiol, Brontes, Stereopes, and Arges, ench laving one eye in the midde of his forehead; these were sons of Uranus and Grea, belonged to the race of Titans, and forged thunderbolts for Zens. Hurled into Tartarus by their father, but delivered by their mother, they helped Kronos to usurp the government of heaven. Fronos, however, in his turn, threw them bacis to Tartarus, from which they were again released by Zeus, whose survants they now beeme. Finally, they were slain by Apollin, because they forged the thmoderbolt with which Zeus killed Asclepins. Later tradition placed their workshop, in Mumt Etna, or in the volcanoes of Lemnos and Lipari, and made them the slaves of Hephaestus. 3. The C. mentioned by Strabo, as a jueple who had come froms Thrace or Lycia to Argohs, and were distingnished for their skill as builders. Their constructions are known as the Cyclopean walls, and many of them still exist in parts of Greece and Italy. The statement of Strabo is quite untrustworthy. Mrore lrobably the socalled Cyelopean walls were huilt hy some anciont race, perhaps the I'elasgi (f. v), at a period hong anterior to the historical civilisations of Greece and liome.

CY'CLOPS, a genus of minute entomostracons crustaceans of the orker Bromehiopode (1. v.), having a soft and rather gelatinous body divided into two portions, one consisting of the head and thorax,

Cyclops V'ulgaris:
$a$, yuuns; $b, b$, ckg bags.
the other forming the tail. 'Iherr is only one eye, situated in the middle of the foreheal, and generally of a bright crimson colom, sparkling like a gem when the anmal is vewed through a miernscope. The specins of (\% are mmerons; they inhabit both the scan and frosh watera, gencrally residing amoug w uma aquatic plants. They arw extremely active, and dart alont with eqreat rapidity.

GYOLARA'MA, a serics of views, which, being womd romul rymulers, are made to pass in comserntife orider hefore tho spectatur, so as to produce the whert of motion on his piat, as the lanks of a river are sem from a steam-boat, or the country from a railway.

CILINDER (Gr. kylindo, to roll) is the name of a genus of geometrical solid figures, of which tlsure may be endless spucies. 'IThe most conmonn Fime of $C$. is that which is generated by the rebolntion of a rectangular daratlelonam alont onse of its sides, which line is ciallenl the axis of the cylimder. But in order to embrace all varieties of eylinders, we must generalise the note of generation. A C., then, is a solid generated ly a line which moves parallel to itself while one cral tracess npon a plane any curve whatever. Whan the position uf the renurating line is at right angles to the phane, the C. is right: when mot, it is odligue. If the curve traced is a circle, and the line perpendicnlar to the plame, the $C$. is a right circular C., \&e. la all cases, the content of the $U$. is fommd by multiplying the number of spuare units in the Lase by the number of lancar units in Cylinder.
by the number of linear units in
the altide, which is the perpendicular distance between the two ends. The area of the couvex surface is equal to a rectangular parallelogram whose base is the circumference of the cud, and its height the length of the gemerating line. To this must be akled the areas of the two ends, to get the whole surface of the cylimiler.

CY'MA (Lnt.), in Arehitecture, a monliline consisting of a hollow and roumd conjoined. Whan

have mate the wond popmar: the metaphor is grommad on Lrose Minor being the constellation towards which the others look, as it were, and rommi which they wheel.

## ClNOSU'RUS. Se DOG"s-mL Giass.

CIPERA'SE, or CAHCJSEAE, sometimes [opudarly called Setmes, a matumal order of plants. akin to Grasses, hat havine y y-nerally a triangalar stem, which is witlont joints, or almust so, and often leatless. The loaves aro sometimes sheathing, but their sheaths are always entere, not split, as in the grasses. The flowers, which are hermaplumbite in some, and misexual in others, consist of a scalelike glmme, under which lie the organs of fructitication, the prstals alone buing fromeutly enchosed in a selarate for-shapedi coseriner ; the place of the perianth is sometimes surplied ly a few bristles. The stamens are I-IL in number, the anthers rert: the ovary is one-sculled, the style single, triful or lithl ; the fruit a small emstacenms or bomy nut, the embryo lenticular, and enclosed within the base of the albumen. Phants of this order, which contains fully 2000 known suecies, oreme in all zones; sume of the genera, as '(aros ( $1, v$. ), alounding in the colder, some, as ctllofus (1. V), in the warmer prats of the word. Aany of then are phants of rovy bumble growth. some, ats Inloushes, Papros, \&c., comparatively large, but nomm rival in size the bambors and other gigantio wrasses. Dost of them Erow in marshy and moist places, but a few in sumny dry places. 'Their stoms and leaves aro in gencral very dedicient in sucenlones, and in most of them, also very roneh, so that they are naten ly damestieated catthonly when in a rery Gonnes state, and rather from necessity than from
 Hou dAREX, 'vobers, ami sombuts. Some of the nses of plants of this order are noticed in the

 dow rs and conagound spikelets of mamerons two
 contains at prot mumber of sperits, clietly tropicenl,

culler parts of the globe. Only two are fomm in Enfland, and these are very rare. Many of the spucies have thbers or corms, which in some are macilaginous and nutritions; in others, contain also a bitter primeiple, and possess medieinal qualities. Of the latter class is C: longuse, or Siweet ( $\because \because$ one of the species which have been fonme in England, common in ditches and wet mealows in some purts of Emrope, the rhizome of which has an orlour of violets, and is astringent, tonic, aul stomachic. It has been employed in medicine from rery ancient times; bit is now more used in perfumery. Some of the fmbian species are alsn nsed medicinally and in porfuncry in their native comntry, is well as species of kintred genus. Of those with esculent tubers, the most important is C: esculentus, sometimes callal Kush-nut, a native of the sonth of Eurome and worth of Africa, which is cultivated to a monsider alme extent in Eyylnt, I taly, Spain, I'ortugal, and the siath of France. 'Jhe ront of this plant throws ont crecing lianches, at tho cond of which form farina. ccous tubers of the size of i lazel-nut. which are called Earth Almonils ( Amande de terore) loy the lrench. They lave a

Cyperus Escrlentus: $a$, whole plant; $b$, eluster of spiliclets; $c$, a single flower. swertish taste, and are nsed like almonels for the dessert, and also for making Orfot ( $11 . \mathrm{r}$.$) . They are said to possess$ not only nutritive, lint restorative and stimnlant froperties. Of late, they bave become a considerable articlo of commerce, noon account of the hamal fixed of which they yiehl, and are chietly experter from Nomin and Portugal to Holland. They contain abont 16 por cont. of oil. The roots of this 1 lant and its allies are the only roots known to contitin much wil. The tubers of $C$. bullowns or Jemeticles are vaten in Imlia, cither roasted or lubled. or are drind in the sun and mate into hroul: but their small size makes them tromblesome of collection anil preparation. Those of 6 . (feminatus are also eatern. The tubers of some surens of scirgus (t. v.) resmable in quality those oi the esculent species ul ryperns. The fibre of ${ }^{1}$. tartilis is sustrong that it is employed in Indua for making mats.

('YPlaLNODONTIDA, a famsly of malaempermus fishes, alleel to Comminile, with which they were fomerly ranker, hat differing from them in having the jaws mom grotractile and torthed. Some of them are American, some Asiatic: some inhalit fresh, and some salt water. To this ortur betons soma interntine and curious hishes particularly the Analheg (4.v.), remarkallu for the conformation of its eyes. The species of the gemes orestines are 385
found in the lakes of the Andes, at a great elevation above the sea, and are highly esteemed for the table.

CS'PRIS, a genus of minnte entomostracous rrustaceans of the order Branchiopolda (q. v.), having the borly enclosed in a shell of two horny pieces, sowewhat resembling that of a bivalve molluse. The antenne and feet are beautifully feathered with long fringed bristles, by means of which these animals swim with much vivacity. They abound in every pool of stagnant water. Their homy shells are very abmolant in a fossil state in the Wealden rocks of England, in the limestone of the carboniferous series, \&c.

CY'PRUS (Anc. Gir. Kupros, Mod. Gr. Kibris, Fr. Chipre, ltal Cipro), an island situated seuth of Asia Minor, in that portion of the Mediterranean called the Levant. C. was anciently divided into many small kingdoms. It was originally possessed by the Jhnenicians, from whom it passed to the Greeks, and subsequently to the Espontians and Persians. After the victories of Alexander, it declared for Macedon. It next became a portion of the Graco-Dgyptian kinglom of the Ptolemies, then of the Roman and Byzantine empires. The Arabs conquered it 648 A. D. ; in 1191, it was taken by Richard Cour-de-Lion, who ceded it to the Templars. After several vicissitudes, it came into the possession of the Venetians, from whom it was finally conquered by the Turks in 1571.
C. Lies in lat. $35^{\circ} \mathrm{N}$., long. $32^{\circ} 20^{\prime}-34^{\circ} 40^{\prime}$ E., its greatest length from Baffa, in the sonth-west, to Cape Audrea, in the north-east, being about 140 miles; and its greatest breadth, between Cape Gatto and Cape Kornachiti, about 60. The total area is 1000 square leagues; aud its population in 1858, 180,000 . A range of mountains-the Stavro Vuno and Santa Croce (ancient olympus)-the sides of which are very hold and rugged, runs through the whole length of the island, attaining an elevation of more than 7000 feet above the sea. Three-fifths of the island is mountainous. Of these one-fifth has splendid forcsts of oak interspersed with walnuttrees, and wond furnish large supplies of sulphur, pit-coal, and metals of various kinds, under intelligent management ; while two-fifths is adapted for vine and olive culture, and the growth of fruit-trees generally. 'The remaining two-tifths is composed of magnificent plains, and cxtensive open comntry, which, though wanting in rivers and streams, are atill very productive in cereals.' 'The soil is exceedingly fertile, yiclding all kinds of grain, together with tobacco, flax, cetton, madker, sesame, \&c.; other products are wool, cotton, and silk. Of the latter, two crops are olitained in the year. C. has also two valuable salt-pits. Its great want is water. The few springs dry up in the summer, and not a drop of rain falls during seven months in the year. The climate is on the whole very bealthy; the diseascs, "] both with regard to their frequency and their character, do not relatively reach threefifths of the amount of disease in Eurole, or even in Italy.' Agriculture and manufactures are alike in a backward state; the Greck Christians, who compuse the fulk of the popuation, being indurnt and spiritless, through fear of the dominant 'Turks, who are ignorant and fanatical. The former, however, have an unenvialle reputation for doubledealing. The revemur amounts to $14,000,000$ fiastres ( $£ 116 ;(666)$, while the total dislursements for knvermment, \&e, amount only to $1,000,1000$ phastres (E8333), so that then $1^{\text {maserssion of } \mathrm{C} \text {. is a }}$ Frar ammal gain of $£ 108$, orf to the sultan. The thiphing of the island is trifling, eomprising only from 5 t. 10 versels, of 50 to 100 tons, and from 30
to 80 smaller boats. The imports in 1858 amounted to $£ 57,939$, and the exports to $£\{31,110$. The chief towns of C. are Nicosia, the capital and seat of the Turkish goverument; Famagosta, Larmica, the residence of the European consuls; and Limassol.Report of British Consul, 1858.

## CX'PSELUS. See Swift.

CYR, St, the name of several places in France, the most important of which is St C., in the department of Seine-et-Oise, about 3 miles west of Versailles. Pop. 1000. The village owes its origin to an educational institution for the danghters of nobles of fourth descent on the father's side, founded here in IOS6 by Lonis XIV., on the suggestion of Madame de Maintenon. There were about 250 pupils, for whom Racine wrote his tragedies of Esther and Athulie. Madame de Maintenon dien here, and was buried in the choir of the church. The institution was suppressed at the Revolution. The buildings were at first converted into a military hospital, and in 1803 into a military schoul by Napoleon for the education of some 300 officers, about 140 of whom leave annually.
CYTENA'TC SCHOOL. See Aristippes.
CYHENA'ICA, the name of the district whose capital was Cyrene (4. v.). At one period, it nominally stretched from Carthage to Egypt, and extended inland as far south as the oasis of Fezzan; but a great portion of this territory was occupied by the subject Libyan tribes, and not hy the Greek colonists, who were contined chiefly to the platean of Barca, with the subjacent coast. This portion of C. Was, and still is one of the loveliest and most agreeable regions of the world. The climate is delicious, mountains on the south sheltering the land from the scorching Hasts of the Sahara, and cool sea-winds fanning it on the north. From the central ilateau, whose brealth is about 80 miles, the land slopes down in verdant terraces to the Mediterranean. These terraces are cut and watered by mountain streams, forming luxuriant ravines. The productions of C. mentioned by aneient writers are corn, oil, wine, honey, fruits of all kinds, cucumbers, trufles, cabbage ; flowers yielding the richest perfumes; and a rare plant called silphium (still abundant), from which was obtained the grum-resin, greatly esteemed for medicinal purposes. The country was also celebrated for its breed of horses, but was much exposed to the ravages of locusts.
The chief cities of C. were Cyrene, Tencheira (afterwards called Arsinoë), Hesperides (afterwards called Berence), Barca, and Apollonia. To each of these five cities (whence in the time of the Ptolemies C. was named Peutapolis and Pentapolitana Regia), a certain amount of territory was attached. This favoured their individual independence; and the consequence was that the dynasty of Battus, who led the first Greek colony to (yrene (q. v.), exereised very little influence over C. in general. After passing into the hands of the Eryptians and Romans, $C$. became a partion of the Byantine empire. In 616 A. 11, it was eonquered by the l'ersian ('hosroes, and in 617 was owrrim ley the Arabs. Ancient C. ncarly eorresponds with modern liarea ( 1. v.).

CYRE'NE, the (apital of Oyrenaica (q. v.), was fommed, 633 b. C., by a colony of Spartions under Battus, whose dynasty laster] fur nearly two centurics. During this priod, it made madidadances. On the doath of Arcesilaus $1 \mathbf{V}$., the last of tho battidie, alunt 450 ar. ©, a repmblio was established, but the politieal comdition of the city under the new Gow rmacnt was far from prosicrous. Party contusts ragred, mutil at last it fefl into the hands of the Somans. During its prosperity, C. carried on a great commerce with Greece and Erypt, and to a

## CYlRA.-CYRUS.

less extent with Carthare. Its extensive ruins still attest its former mamifiernce. (\% was the birth. plane of the philosuphers Aristipms, Annicuris, and Carmeades, the pert 'allimachas, the astronomer Eratesthenes, and the rhotorician Synesius, whe afterwards became lishop of Apollonia.

OYRll , Sk, Bishon of Aldxandria, wat one of the most energetic, but least manable of the "hareh Fathors. The date of his birth is not known. He was colucated loy the fanatical monks of Nitria, with whom he livel for five ycars, and who proluably inspined him with that fiery, intelomant, and ignorat zeal which characterisel him through life. Sulsequently, he went to Alexandria, where he became a persbyter, and on the death of his mele, 'Theophilus, $41^{12}$ A. I., oltained the episcopal see. He hated now full serpe: to exhibit his armgance, vindictive jealousy, and priestly real. The Alexandrian Jews, Whan were mumerons and wealthy, were the dirst to fecl the fiereeness of his pions wrath. Sonne ('hristian blool having leen shed by them in a city tumult, C. pat hinself at the head of a rahble of zealuts, attacked the Jewish quarter of Alexindria, destroyed the houses, and banished the imhabitants. Orestes, the prefect of LEypit, having drawn up an aceusation against C., was attacked in the strcets loy 500 monks. who had come ur from the deserts of Nitria, at the call of their old companion, eager for the work of destruction. One of these monks having fallen in the skimish, his corpse was carried in procession to the High Church of Alexandria, where C. delivered a sanguinary discourse, gave the deal monk the anne of Thumousius, and pronounced him a martyr and a saint. But perhaps the most harbarous deed with which this perseentor of heretics and heathens had to do, was the murder of the heathen maiden Hypatia (q. v.), the daughter of the mathematician Theon. Theodoret gravely aceuses him of mstigating the Alcxandrian ponulace to, this homid act; and mfortmately there is nothing in C.'s character to make us loubt the truth of the acensation. But the most important historic event in his career, was his controversy with Nestorins (q. v.). All the worst features of his disposition appeared in this broil. In the midst of monietudes, which he himself had largely wecasioned, he died $444 \mathrm{~A} . \mathrm{n}$. C's numerms writings consist of commentaries, treatises, homilies, "pistles, fe. The best elition was published by Aubert (7 vols., I'uris, 1038).

CX'RIL. St, Bishop of Jerusalem. an eminent Church Father, was bon at Jerusalem about 315 A. D., and ordained a deacon in $3: 34$, a presbyter in 345 , and on the death of Maximus in 351 , was elected lishop of his native city. His metropolitan was the Arian bishop, Acacius of Cesarea, with whom he was soon engaged in hot contlict coneerning miminally the rights of his oflice, lont ultimately their differences of doctrine. Asacius accused C., before a conneil hastily 'got up' at Casarea in 35s, of selling the treasures of his church in a time of famine t. feel the poor! Stringe to say, C. was deposed fur doing this praiseworthy action. He now appeales to a larger synol, which was bodd at Selenceia. This synod restorend him to his office: lout once more, throngh the persevering hastility of Acacius, he was deposed by a comel issemblet at Constantinyple in 36\%. On the leath of the Emperor Constantius be was again resturer to his episeopate in 302. Soon after, his old enemy Aeacius died, but C. was imuediately involvel in new diffienties. After considerable strite, C. was banished, ly order of the Emperor Valens, in 307 ; nor did he return till the emperor's death in 37 s . He died in 356 .
C.'s writings are extrmely valualke, not on aceount of their virour, profundity, or lwauty, but on account of their therology. They consist of 2: treatises, 18 of which are ardhessed to catechumens, and io to the newly haptiserl. Tha: former are for the most part dumtrinal, and prosent to us in a more exmplete and systimatic mamer than the writing of any other Fither the crest of the church; the latter are ritual, amb rive us a minute aceount of haptism, ehrism, and the Lord's supper. Their styl!, is simple and unatetractive. The best edition of C.'s works is that published by 'louttere, the birnedictine monk (Par. 1720).

CYRIL , the apostle of the Slaves (in the gth $e$ ), sprang from a respectable family living in the halfslavic, half-(ireck town of Thessalonica. On accomet of his knowledge, he oltained the surname of the Philosopher. Maving been cousecrated a priest, he went forth, during the reign of the Byzantine euperor, Michael III., to evangelise the Chasars, who dwelt by the Caspian Sea. Mis labours were very snccessful, the khan himself being among his converts. Boris, the heathen prinee of lingaria, having aloont this time besunght the patriareh of Constantionple to send him a preacher of the gospel, C., along with his brother Methol, were selected. Their labours were not in vaiu. Boris was baptised in S60. ILastic, prince of Moraria, next invited them to his country. They accepted the imvitation, and while there, assisted by it nomber of their own pupils, completed their translation of the Holy Scriptures, which is in use to the present day, as a sacred or chureh languare, amons all Greek-C'itholic Clristians (liussians, Bulgarians, and Surbs). From Moravia, Christianity, aceording to the slavic ritnal, spread into Bohemia, whose prince, Buriwoj, and his spouse, Ludunilla, wore baptised by Cyril. (. died in S69. The Apoloni Morales, ascriben to C., were published by Corter (Tienna, 1630). See Lichter's Cyril and Mcthod (Olmütz, ISO5).

CY' $^{-1}$ US, the fouder of the Persian monarchy. commonly callen C. The Elder, was, aecording to Herodotns, the son of Cambyses, a Persian noble, and of Mandine, daughter of Astyages, the MedoI'ersian king. His birth was a source of alarm to his grandfather Astyages, who hal previously had a dream, the interpretation of which portended that the offsuring of Mandane would one day be the ruin of the Medlian supremacy and the ruler of all Asia. He therefore contrived to get the infant into his own hands, and gave it to Harpagus, his chief servant. with orders to put it to death. Harpagns promised to do so, but intrusted it privily to the eare of a herdsman, who bronght it up alon's with his own children. The youmg U. quickly distinguished himself among the conntry lads by his superior daring and dignity. On une oceasim, he was elected king in some boyish game by his companions, and in the exercise of his regal authority, causel a nolleman's son to he severely scoursed. The father complained to Astyages. whir cansel the culprit to be bronght lefore him. and reconvising in his persom and mien his uwn grandson, sent C. hack to P'ersia-the Mani having in sone way satisticil him that his dream had alrealy received its fultilmont. C'. himself, however, did nut think so, and as be grew up to manhood, beran to meditate ambitions schemes. All writers testify to his courace, amiability, and address. lie was exactly the kind of man to gather round him have, venturesome, loyal followers. The tyrany of Astyares bal mad" him hateful to his subjects, and by the hedp of the crafty Harpagus, C. soon formed a party among the Medes favourable to his designs. I'utting himself at the head of his Persian troops, C. advanced into Media, and overthrew the
forces of Astyages ( $559 \mathrm{~b} . \mathrm{c}$. ). After consolitating his new lominions, which seems to have cust him many years' labour, he proceeded in his career of comquest. The kingdom of Lydia first yielled ( $546 \mathrm{B3}$. C ), and its kmg, the famous Crossus, fell into his hands. [ltimately, the whole of Asia Hinor was subdued. But the crowning triumph of $C$. was his capture of the city of Babylon, the metropolis of Assyria (5is e. C.), whose kine was Labynetus, the Lelshazzar of Daniel. Through the instrum ntality of C , the Jews were delivered from their calitivity, and allowed to return to l'alestme. His vast ambition, however, proved his ruin. He wished his power to, orershadme all Asia, in harmony with the dream of his grandfather ; and althourth his dominions already extended from the Fellespont almost to the Indus. he resolvelt to sulbugate the Soythian perples, and began an unjust war with the Massaretie, 2 nation or tribe who dwelt to the north-east of the Caspian, beyond the Araxes, whose queen was called Tomyris. At first $C$. was successful, but in a secourl engagement he was defeated and slain (529 в. С.).

Such is the account given ly Itcrodntus, and although we are malle to affirn that it rests on absolutely histurical groumt, it is muluestionably t" be preferrel to any other. The work of Xenoption, entitled the Cyropnclein, is not a history; it is a historical romance, and was manifestly intendel by the authon for such. Kenophom wished to ficture a great and wise king, and finling the elements hoth of greatness and wishom in $(\therefore$, he took alvantase of his historic persmality, and engrafted upon it whatever, according to his own motion, would emoble and dignify it.

CYRUS. The Yougher, the seconcl of the sons of Darius Kothns, or Ochus, lived about I 30 years after the great dyrus. He conspired against his brother Artaxerxes Inemon, who had sncceeded to the throne ( 104 is.c.). The plot, however, beiner discovered, he was at first seatenced to death, bat afterwards pardoned, and even restored to his dimpity as satrap uf Asia Minor. Here be employed himself in making arrangements fur war against his l,rother, although le concealed his purposes to the very last. In the spring of to1 B. C., he left Sardis at the houl of 100,000 A siaties, and 13,000 (ireek mercenaries, umler pretence of chastising the robbers of Pisilia. Artaxerxes being warned of C!'s prertidy, male praparations to olpose him, and the two armies encomenterl each other in the jlains of ('maxa, 500 stadia from Bahylon. was defeated and slain, although the Cireriss fonecht with the greatest courage, and ewen ronted that portion of Artaxerxes' tropis immediathly opposed to them. The fortunes of the firceks, om their rotreat throwh the highlants of Armonib, in sever" winter-weather, are recorded by Xemonhon in his Andutios (I. V.).

CYST (bystis, a blader), a word sometimes used in the original sonse as rppliced to hollow organs with thin walls, its the urinary bladele ant gall Hadker; but commonly reservel for the designation of gathok qical strnctures or new formations within the lonly, having the habler form. ''ysts are consmonly transarent, and often almost structurdess in their timaty; they are commonly, however, limed by an Spithelium ( (I. vo), and have memhanmes walls, with fant induations of tibrous structur".
 multifuratar; they are sometimes sumall, numprons, and sopurath; in other rases, they grow to an
 aro clistuetly porasitice, ami of indepement animal
 Entuait (g. v.) geverally, Whers are probatily
formed nut of the structures in which they arise, their true pathology being, howeyer, obscure. Nuch are the eysts of the kidney, and still mure distinctly, the immense complex cystic struetures which furm in the ovary. See Ovari, Dreases of.

CYSTIC W'ORBS, an orler of Entnoon, or fatestimal Worms, :ccurling to the systen of Keder and litulophi, for some time generally received hy naturalists, characterisel by the body enling in is transparent cyst or bladder filled with pellucid fluid, this borly having somotimes only one head, as in Cysticercus, sometines many, as in Cenurus. It has, however, been found that certain species, as Cysticrocus collulente and ripnurus cerebrulis, arm the young of cestoid worms, and it is therefore concluded as highly probable, that all the C. W. are of the same nature, more particularly as all present the apprearance of immaturity, in the want of visible organs of reproluction. Until a comparatively recent late, the animal nature of $\therefore \mathrm{W}$. was not recognised, nor is it long since their relation to tape-worms and other cestoid worms has been fully ascertainel. Sel Eestom Worme, Uxsticereces, Echinococeč, staggers, and Tape-worm.

CYSTLCE'RCUS (tir, bladder-tail), according to many maturalists, a gemus of ('ystic Worms (q. v), characterised by a dilated eyst with a single hear, which has four suckers and a circlet of hooks. This ychus has, luwever, recently been displaced from the system of nature liy the discovery that the forms referred to it are only the young of tapes worms. This discovery has heen confirmed by a multitude of ulscrvations and experiments with regard particularly to C'. celluloser. found in human beings, aud in many rodent and lachydermatous animals-as rabbits, pigs, \&e.- the young of the common tape-worm; and C. temicollis, found more rarely in buma beings, but often in the abdominal cavity of ruminant quadrupeds, and of pigs, horses, and many other anmals-the young of a tape-worm of the ling. C. celluluse often exists in great numbers in the flesh of pigs, causing the diseased appearance known as measly. See Cestom Woms, where it is figurel. It sumetimes occurs in like manner infesting the human body, in muscles of most varions parts; it has heen found even in the heart, in the hrain, and in the eye. That in such cases it sometimes causes death, is too certain, and its removal is mot easy, cxeppt when it is so situated that it can be reachel by the knife, nor is there any sure indication ly which its presence in many situations can le known: hont it appears also that it may die and hee alsonder without cansing any very serious comsergeners to the person in whom it has dwelt. The eysts of this species are always of small size: those of $r$ t tmuicollis, however, which generally wenrs in the liser, or in other alulomimal organs, sometimes beome, in some of the lower animals, as large as a chtild's head, Injurions consequences are promedel by them when "ither mumenom or very lare.
 variety of (Gilemlus (q. v.). It contains $\mathrm{C}_{n} \mathrm{IH}_{n} \mathrm{NO}_{4} \mathrm{r}_{2}$, has a crystalline texture, a brownish-ychlow eobmr, and is scmitrineprarout. It is not solulle in water, abeohel, or "ther, lat dissolves in the stroner anmls.
"Y'SI'TIS. Inflammation of the urimary hadder (4. v.).

 of the specins, haring lome twigey branches, are popularly ealled lisomm (y. $v$ ), othors are called bahumum (q. ソ.), Whilst others still are gemeally known ly the mann "ytisus. The characters "if the genus are stated in the article Rroos. The

U'VICUS, a peninsula of Anathlia, Saik Mimm, proweting into the sha of Mamman. It lues wh the
 mikes somth-west of Comstantimple. It wats at aus time an island, but the eralnall fommation of :hn isthmus comuctol it with the mamlanl. Its lo ourth from sonth to north is alout nine milus, ann its breadth fromest to west is miles. In carly times, ${ }^{( }$C. Was a Milesian colony, and the city of C ., num whose site vineyards and oreharels now thomish, is deseribed berstraber as une of the first cities in Isia, alike for extent and splendour.

CZACKI, Tadersiz, an rminent Pohish anthor, was hom in 1765 at Poryck, in Volhynia. At the are of twenty, he ohtained an olfice in the supreme justiciary court at Warsaw, and was also manle director of the crown archives-a situation wheh enathed him to gratify lis taste for loolish history. some essays on I'olish finance imbuced the deet to select him, in 1788 , as a member of the commission of inquiry into the state of the revenus. Its cthorts to animate the industry and extend the commerce of his mative comntry were most 1 maiseworthy, A valuable result of his travels throngh lomand for this purpose is a map of its river-system. He also interested himself greatly in the navigation of the Dniester. At the secom partition of Colami, he lost his property, but it was afterwards restored. The chef labour of his life, however, was in connection with the education of his combrymen. 1lis endeavours to instruct the poople in the add ['olish provinecs of liussia, where education han heen almost wholly neglected, met the approval of the Emperor Alexader. 'The most impurtant of C's edneational institutions was the eymmasimm at Krzemienice. In ISOT, he was alpminter the depouty of Prince Czartorysk, whon had the care of public instrnction in the Poblisly wownment of West Ifussia. C. died at mabno, sth Felmary 181\%. Itis writings prove the comprehcosive character of his attainments. His most valuable work is upon Lithuanian Law (O Litewakich i P'ulskich Pruwech, : vols., War. Is 100 ).

CZAR, more properly Zur, is a title of the Jussian emperor. The worl is elerivel from the old Slavomic language, and signities much the same as Ger. Faiser, Lat. 'eterer, tw which it Imbahly owes its origin; althongh some ctymologists identify it with the termination of the names of the old Assyrian kings-such as I'halassatr, Nabonassar, and Nabopolassar. After the 1oth c., we find the Russian annalists giving the title of $\mathbf{C}$. $\mathbf{t}$, the (irand Duke Wladimir, Nonomach (fled 1525 , and to several of his successors. In general, however, the rulers of the various liussian provinces wor ealle d Cirand Dukes till the loth century. Thas, we have the Grand Dukes of Whadinir, Kiew, Noscow, de. The Crand lonke Wassilij I wanowiteh first assumed, in the year 1505, the title of remodershen which signities autocrat. The son of Wassilij, I wan IL., Wassiljewitel the Cruel, cansed himself to be solpmoly erowned $\because$, With Jannary 1547 . From this time, the Linssian monarchs called themselves -zars of Moscow ; and after the comquest of lattle Thussia and smolensk, Czars of All the liussias. The ward now leeame practically the equivalent of Empror' ; yet Peter 1., in J7at, thought fit to assume this latter title in adilition; and as the
hinsuian lammage hand ne torm corresponding to it hasidkes (", dur Lation word Impurutur was intro.

CZAsLAD a town of Pohamia, 解 miles east-sonth-east of J'rashe. Its deancry-xhureh, in which the echehrated bliml hlusite lealior, Ceneral Ziska, was buried, is surmonted hy the highest steephe in Buhemia. ' : is also nuted as the scene of an impuntant victory quacel wor the Austrians by Frederick the fireat, 17th May 174. L'ol. 4000 . who are chicdly ragaqed in agricultume and the manufacture of saltpetre.

CZECIIES, the most westerly branch of the great slavic family of nations. About 451 405 A. D., the C. migrated from their lauds in C'arnathia, on the

UTper Tistula, and came into the comntry now known as Buhemia. According to tradition, theit chicftain was named Czech. Georesberse near Raudnitz, on the Elbe, is said to bave been the first place chosen by the $\because$ for their encampment. Uther Slavic trihes migrated into Bohemia; but in the course of time the C . gained such an ascenteracy that, in the 9 th $c$., the nane $~ U$. was commonly applied to the whole Slavic population of Bohemia (c. v.).

CZE'GLED, a market-town of 1Iungary, situated on a plain between the Danmbe and the Theiss, 40 miles south-east of I'esth. It has some handsome buildings and large breweries. The inliabitants, 18,000 in number, are emploged pruncipally in agricultural pursuits, the district aronna yielding much grain and red wine.

OZENSTOCHAU, or CZENSTOCHOWA, a monastery of the order of St Panl the Hermit, in the Polish government of Kalisch. It is the most frequented place of pilgrimage in the whole commtry, and is celebrated thronghont all the Slavic nations. It oceupies a commanding position on the Warthe, not far from the Silesian frontier, and possesses the famous darls-coloured pieture of the mother of Christ, which has given occasion to the worship of the Black Virgin by all the Polish Catholies. This picture is prolially of Byzantine origin. According to the legend iu commection with it, it was painted by Lake himself; passed into the hands of the Princess Helena; subsequently found its way through a Russian prince, Laon, to Bulz in Galicia; and finally, throngh Wadyslaw, Duke of Oppeln, who built the monastery of C., was brought thither to assist him against the Tartars. In more recent times, C . is noted as being the only place in Poland which offered resistance to the army of Charles Gustarus, king of Sweden, on which occasion (1655 A. D.) the inmates, comprising 70 monks and 150 soldiers, withstood a siege of 3 S days carried on by a Swedish force of $10,00^{\circ}$ innll it a later period, 890
however, C. lost its importance as a military positron. At the foot of the eminence on which the monaster'y stands, lie two little towns, Olri and New U, which cary on a considerable trade in holy pictures and amulets.

UZE"RNOWITZ, a town of the Austrian Bukowina, situated on a lill nuar the right luank of the Prith, about 140 miles south-east of Lemberc, in lat. $45^{\circ} 26^{\prime}$ N., long. $25^{\circ} 59^{\prime}$ E. It has a Greek cathedral, and manufactires of clocks, silver articles, and haviwares. Pop. 1S51, 20,500 .

CZERNI, GEORG, properly, Faradjordje, i. e., Black George, the leader of the Servians in their struggles for independence, was born in 1770 in the neighbourhood of Belgrade. He shewed, when young, his hatred of the oppressors of his country by murdering a Moslem. After spending some time in Austria, he returned to his paternal estate. In Angust 1801, a band of janizaries lroke into his dwelling, and plundered it. C. Hed, vowing vengeance. He soon collected a band of malcontents, and commenced a sort of suerilla war. Gradually his numbers increastd, and im 1804 he captured the fortress of Schabaz. Subsequently, he invested Belgrade, and in the beginning of 1806 routed the Turks at the rivers Drina and Morawa. Assisted secretly by Russia, he captured Bugarde in Decem. her 1s06. After the treaty of Slobosje (Sth July 1808), he was elccted governor by the people, and recognised as Prince of Servia by the sultan. The French invasion of Rassia in 1812 compelled the latter country to let Servia shift for itself. Hostili. ties recommenced; the Tulis were snccessful, and C. had to flee to Russia. He afterwards went to Austria, where he lived for some time. Meanwhile, the freedom of Servia had been secured through the leadership of Milosch Obrenowiez; and in July 1817 , U. retumed, intending, as some suppose, to rally his partisans round him for the furtherance of his ambitious schemes, when he was murflered at the instigation of Prince Milosch. dons. The Greek $د$, in fact, yet 3 preserves a reeognisable resemblanee to the door or opening of a tent, the kind of door most familiar to a nomadic people. D belongs to the order of letters called dentats (see Letrers, Alphabet), $t, d$, th (in thim), the (in thine), and in the correspond. ing words of sister-languages is often exchanged with those of the same order or organ; thms: Ger. dlu, Eng, thou: Ger. tod, Eng. death; Lat. due-, Engtuy; Lat. dwo, Eng. two. A more remarkahle interchange is that hetween $d$ and $l$, and $d$ and $r$. See $L$ and R. D seems to have been drawn into some worls (to which it does not radieally belong) by a kind of affinity for $n$, as Lat. conis, Gr. kyon, Eng. hound: Lat. gener-, Eng. gender. Di followed hy a vowel is sometimes transformed into $J$; as in Janus for Dianus; Journal from diernal. Di followed by a vowel in Latin, has, in Italian, hecome $z$; and from MSS. and other evidence, we know that this sibilant sound of $d i$ prevailet, in the popular pronuneiation at least, while Latin was yet a living tongue. Thus, diabolus is found written zabolus, and Amazones, Amadiones.-D, the Roman numeral for 500 , arose out of the character $\mathbf{l}_{\mathrm{a}}$. See Numerals.
$D_{\text {, }}$ in Musie, is the sceond note in the natural seale, and is a whole tone above C , to which it stands in mathematical proportion as $9: 8$, that is, when C vibrates eight times, I vibrates nine times. The whole tone from C to D is ealled the greater whole tone, being a comma larger than the next whole tone from D to E .

DA CA'PO (Ital., from the beginuing), a term in Music, frequently placed at the end of a part or movement, indicating that the performer must return to the begiming of the movement, or to some other part of it usually marked with the sign :S:, and finish where the word fine is placed. Searlatti was the first who introduced the use of the da capo in his opera of Theolloru. The words are generally abbreviated thes, D. C., sometimes $D$. $C$.' al fine.

Da Vi'nci, Leonardo. See Leonatido bat Yesct.

DAB (Platessa limanda), a fish of the same genus with the plaice and flounder, and very much resembling them, but easily distinguished from either of them by its more uniform and lighter-brown colour, the roughness of its scaly surface, and its more curved lateral line, which rises into a high arch over the prectoral fin. It is common on all sandy parts of the British eoasts, inbabits deeper water than the floumer, and does not, like it, eater the mouths of streams. It is known on the coasts of the Furth of Forth as the Salt-water Fluke. It is
preforred to the flonnder for the table. It soldom exceeds 12 inches in length. A rather larger sprecies of the same genus, less plentiful on the liritish coasts, is the Lemon D. or ssoomi 1). ( $P$. mirrocephuler). Its body is smonth, its colomer a pretty

Dab (Platessa liment 1 .
mixture of various shades of reddish-brown and yellow : its head and mouth are very small.

## DABCHICK. See Grebe.

DA'CCA, a eity of Bengal Proper, stands ahout 150 miles to the northeast of Calcutta, in lat. 2,3 $43^{\prime} \mathrm{N}$., and long. $90^{\circ} 25^{\prime} \mathrm{E}$. It is situated on the Burha Gunga, a considerable anxiliary of the Dulasseree, which is itself at once a mingled offset of the Prahmaputra and the Ganges, and an aflluent of the lower conrse of the former stream. The city thas enjoys singular facilities in the way of imlanil navigation. Down to the elose of the 15 th c.. D. was widely eelebrated for the delicate texture of its musling, which, in the phraseolory of the East, were characterised as 'thowing water" and 'cremm'; dew:' and, in ennection with this manufacture, the French and the Dutch, as well as the Enchsh, hat extensive establishments in the phace. Since 150l, however, these European agencies have disalpeared; while the anomal value of the elorant fabre, umber the influence of Pritish competition, has gradually fallen from $x 250,000$ to nothing at all. The pesent aspect of the city is in keeping with this uttur deeay of its staple trale. In many puarters are ruins overgrown with jungle, the haunts of tigers and serpents: and this remark is applicable to umberous splemtin elifices. such as the residenees of its natire princes and the factories of its foreign sojourners. Still 1)., within a space of 4 miles in leagth by $1^{1}$ in hrath, is understond to cuntain upwards of $60,(16 \%$ mhalitants. It seems, of late years, to have bartially recoverel from the effects of its commereial decline. Busides 181 mosifues and 119 pagudas, there are phaces of worshij, belonging to Lomanists, Armenims, Grecks, and English, both Lpiscopalians and Dapitists. Py the last-mentioned denomination, several schools are maintained; and there is alno a college, which, in 1550 , was atteniced by 340 1upils- 46 , 'bristians, 15 Mohamnedans, and 299 Ilindus. The temperature at noon averages on the twelve months $79^{\circ} \mathrm{F}$.; and the mean rain-fall is said to be 70 inches.

## DACCA-DACIER.

D. C'C'A. the district of which the alosermentioned eity is the eapital, extends in N. lat. from
 55: containing $1: 601$ square miles, and numbering about Geko,ono inlalatiants. Fomming pourt of the Ereat delta of the Ganees and Iralmaputra, it is traversed by streams in every elirection. beines so low and leved as to be wemerally fooded durmis the raimy seasun. It $j$, on this aceome, almanally adajited to the caltivation of rice. From the Chatater of the comatry, rouds-bappily rendered less necessary by the not-work of rivers-ate very diffecult of construction. In aldition to the city of its own name, the district has two principal towns, Narainganj tuel 1 slampur. 'Though the climate, as a whole, is moist, yet it lyy 10 means prosents unformity in this respect, the annual rain-fall varying in diflerent years from 46 to 93 bnches. Amoner commercial crops, cotton-the raw materiad of the diar-fiamed motshoms-ane neeupied it prominent place. It is now comparatively neflected. beng too short in the strple for the coarse falories which alone contimue to be mive in the district. Recent attempets to introluce a better variety from the Emitcrl states have dailed. It was in $170.5-$ the epoch of the cessinn of Bengal, Ioahar, and Orissa on the bart of the 'ireat Ilongl-that 1). lecane stilject to England; but down to 184.5, the heirs of the native muler suceceded ench other as stipendiaries of the East India Company.
 fresh-water tish of the family (yprinite ( $\mathrm{I} . \mathrm{r}$ ), and of the stme fomms with the roach, die, chab, bleak. minnow, de. It chietly inlahits the dees and clear water of quiet streams. It is foumd in Italy, rrance. Gemmany, de., amd in sonne of the rivers of England, hat is very lacial. It is in form not unlike the roich, but rather more elongated; the month is rather larent, the scales smaller. The numer parts are dusky lace, becommer paler on the sides, and passing nato whate wh the hedls, the cheek and will-covers silvery' white. 'The TI, is yrurarimes, and swims in shoals. Its flesh is permere to that of the roweh, but is not highly' estemmer. The D . is primaps the

## DAGO-DAHLIA.

folnacco. Cattle-rearing is also a source of considerable employment to the inhabitants. who are compusel chiefly of Tartars and of Cancasian tribes. The chicf town is Derbend (c.v.).
I) N'GO, an island in the Baltic Sen, forming a part of the lussian government of Esthonia, situaterl near the entrance of the Gulf of Finland. The narrow channel called Sele-sund separates it from the island of Oesel on the south. Its length is estimated at about 34 miles, and its breadth at 15 miles. The soil, a mixtare of saml and chalk for the most part, is not fertile, the coasts are rocky, and shoals make navigation dangerous. The population, Esthomans mostly, number about 10,000 , and are chiefly employed in fishing and cattle-rearing.

DAGOBA, or DAHGOPA (according to Wilson, from dela, the body, and gopo, what possesses, becanse it contains the hair, tecth, \&e., of Buddha; according to others, from dhatu, a rebic, and gabba, a shrine), are monumental structures containing relies of Buddha. Dagoba seems to be the common Simghalese term for snch monuments: but the more general name is Stupa (\%. v.) or Tope.

DA'sON (Heb. drg, a fish), the national idol of the lhilistines, is frequently mentioned in Scripture; in profane history, the name by which it is known is Derceto. It is always represented on ancient medals as hillf-fish, half-woman, but the Mebrew writer or writers speak of it as a masculime being. Some seholars hare attempted to shew that the word D. comes from the Phenician deupn, wheat; and that it is not the name of a fish-god, but of a gol of agriculture. It is possible, howerer, to combine both notions, by supposing that $D$.
was a deified mortal who bal come in a ship to the coast, and taugbt the people arriculture and other nseful arts. Ancient history abounds with such mytholorical personares, one of whom was called by the Babylonians Odukon, and is rerarded by the hamed Selken as identical with the fishy idnl of the l'hilistines.

1) AGUERREOTXPW PROCESS, the name riven to the original 1 hutographic 1 rocess as introTuced ly its inventor, N1. Dagherre, in 1839. Notwithstanding that it has now heoome so unpopular, on incount of the rery circumstance which gives such perfection to the result-viza, the p"lish of the phate-it is a poness which yiclds to mone in puint if microscopic perfection of detail and rerfect urulation of shade. The pictures it yielols are positive or direct, as given in the eamera, thongh they also appear as negative when viewed at certain angles, and are the rosult of the suecessive action
 a highly polished surfaec of chenically ymer silver. 'The manipulations involvat in conducting the forocess are-1. Cleaning and Iulishiner the plate; $\therefore$ liemering the plate sensitive: 3 . Lxpmesing it in the fabuera; 4. 1 eveloping the latent imares; 5. Fixing the picture.

A conjur plate of mombrate thielaness is coaterl with sifver by the electrotyle wr wther suitabi" nowhom, aml then pulislard to the nemost possible wewnt, sus ats to nhtain, thoneh by nuechanic:al means, it chemically pure surface ; it is then exposiol firat to the vaphur of iomline, aml then to the vapone
of hromine for a length of time, ascertained in practice by watching the beautiful succession of prismatic colours which begin to appear with the first contact of the vapour. The length of exposure in the camera which follows is determined by the amount of light at the time of operating, and the relation between the diameter and focal length of the lens employed. The development of the latent image, which is the next operation, is effected by cxposing the plate in a suitable box to the vapour of mereury, which attaches itself to the various parts of the picture in propartion to the more or less intense action of the light. Those portions of ionlile and bromide of silver unacted on by light, are next remored by immersing the plate in a solution of hyposulphite of soda; and the picture is suhsequently fixed and intensified by pouring over its surface a solution of hyposulpibite of gold, and applying heat; by which means it is coated with is thin film of metallic gold, and thereby readered so permanent that it cannot be rubbed out by ordinary means, but requires a chemical solvent for its removal. It may be mentioned, in conelusion, that though M. Daguerre published, in 1839, the first procticable process for taking pictures by the agency of light, his experiments woukd seem to have lieen surgested by the researches of M. Niepce, who, in 1520 , ohtainel impressions on silver p,lates reulerel sensitive by exposuxe to the vaponrs of suphur and phosphoins.

DaHL, Jonañ Christian Clausen, a Norwegian landscape painter, born at Bergen 24th February 1788, was at first intended for the chureh, but afterwards devoted himself to art. He studied painting for six years under the direction of Professor J. G. Noller. His first attempts were in $y$ more and miniature. They did not exhibit much genins; but public attention was at length exeited by a work which he exhibited in Dreselen in 1819 , entitled "Cascade among Roelis in Norway," Next year, lie went to 1taly, where Thorwaldsen and the Trussian consul-general, Bartholdy, commissioned him to execnte several worlas. In 1521, he was appointed mofessor of painting at Dresden, where he has since permanently resided. $U$. is fond of reprolucing on his canvas the picturesque scenes of his native commtry, which he has often revisited. Amongt his more famons works are a 'View of Naples, "Winter in Zeeland,' 'Yiew of Eergen,' 'Scene from the Environs of Cluristiania,' and a "Winter' Scene on the Banks of the Elhe,' the last two of which attracted great attention at the Paris BXhibition of 1855. D. is a member of several acarlenies.
D) AHLGREN GUN, named after is naval oftieer in the service of the Lnited states government, is the result of a careful sories of experiments on the construction of large ordnance. One peculiarity consists in having relatively less motal in front of the trumnoms, and more hehnit, than had hitherto been constomary. Dahlgre'n guns, mate to lire shells or holluw slint, lave feren introulucerl to at consitlerablo extent in the Inited S゙tithes nuvy.

DAHLIA, a genns ull lare promind berbacenus plants of the natural order ('mmposita, sub-order Gorymhifor, natives of Nexieo. All the varieties in cultivation in onr flower-gimlens, of which not fewer than ${ }^{2}$ (n) have been carefally enumerated, are lerived from two sureies, 1). rariabilis and I). cuccimer, and chictly from the furmer. Few llanty manifest so strons an inelimation to sport and pronluce mew varicties is the 10 ., and llorists havo :lls, ohtained many ly the artiticial fecundation of ono with the pollen of another. Dahlias woro lirst Mrought to Malrid by Spanish botanists
in 1789, amb were son introducerl into, Pholand, but aid not liceone well linoma in Wriglish flawergardons till about thidy gars after: The name was given in honour of Widhl, is swedish lot:mist : hat hecause another genns of plants had received the same name, an attonpt was made to change it to Georinan, which is smetimes ased on the continent, but 1). miversally prevails both perpularly and aumon lotanists in firitain. Amons the most essential characteristics of a fine: D., aceording to the estimation of torists, are a fancess of tho thower, a perfect regularity in the shapw of the florets, and the absence rif an eye or dise; the thorets of the disc, as in othrer 'ilonble' Commbifion, having assmmed the appearance of florets of the ray. Dahlias have tuberons ronits, which contain a comsiderable quantity of fmalin (. f . v.), and are in use as an artiele of food in Mexico. It was at onu: time attompted to introduce thom intor cultivation in Earope for the food cither of man or of cattle; but the taste is nauseous to Europaan mates, and even cattle do not reatily eat them. Dahlias are niten ent down in the northern parts of birtain ly early frosts, in the very midst of their flowering; and their tubers require to be taken ul for the winter, and stmrel in a lry place ont of the reach of frost till spring. They are propagated by seed, by cuttings, and loy tubers. The finer varieties are sometimes graftel on more ordinary stocks.
Dahlmann, Friedrici Chimstorit, l'rofessur of listory and Pclitical Science in the university of Bonn, was born, May 17, 1785, at Wismar. Il is earlier studies in Copendagen and Halle were devoted to arehreology and $l^{\text {thik }}$ logy; but his attention was subsequently directed to the study of politics and the history of the middle ages. The results of his diligence appeared in his Fita Ansy/trii, his Researches in German Mintory (\% vols., Altona, 1822-1823), his edition of the "Dithmor:h Chronicle (Kiel, 1827), and other works. In Isel, D. was appointed Professor of Politieal Science in Gättingen, where he mulbished (1830) his valuahle work en the Sources of German History. Banished in 1837, by King Ernest of Hanover, on account of his protest against the abolition of the IIanoverian constitution, he went to Leipsic and Jena, where he wrote his historical master-piece, the Mistory of Denmart (3 vols., Hamburg, $1840-1843$ ). In 1542, he bceane Professor of History at bomm, and took a prominent part in the political affairs of Germany after the mevement in 1848. Erually oprosel to the tyranny of the moly and of the crown, he lieaded the party of constitutional liberals, who were unfortunately too reasonable to be successful. At the close of the struggle, he returned to his academic duties.
DAHOME'Y, an indeprodent state of Guin :b, Western Africa, extending along the coast from Fort Badagry on the east, to the river Volta, which separates it from Ashantec on the west. Its limits have not been precisely defined, lut it is usnally regarded as extending back to the Kong Momomains. It will thus lie between lat. $6^{\circ}-5^{\circ} 50^{\circ} \mathrm{N}$., and long. $0^{\circ} 30^{\prime}-3^{\circ} \mathrm{E}$. : its breadth heing about 200 , and its length 180 miles. $D$. is for the wost part a vast plain, rising with gentle ascent from the sea towards the Kong Mountains, with offsets of which it is thaversed in its most northerly parts. Although it has no river of any importance save the Volta on its western boundary, it is well watered hy springs and streans: and the soil, a rich, red-colonred clay, almost quite free of stunes, is extremely fertile, Magnificent trees clothe the hills in the north, and maize, beans, and pease grow in splendid huxnriance on the plains, as well as fams, potatoes, melons,
limes, oranges, pine apples, and othor tropical fruts: ratom, sugar, tolnums, ant indigo ars alsur raismol.
 beantiful. Limes, tigers, "1.dhants, hyarnas, and enormons snakes of thw hra kind abomet. Tho Dahomana, who came into poseession of this tract of emmery alrout the luermine of the 1 sthe e, are for the most bart tall, well-formed, and intelliment, and, for an African race singularly lonest and far alvanced in axriculture. With the exception of a inw Hohammedians, whose religions belief is in no way intere feme with, they are all pagans, amp pactise fetishworship. The king is the most absolute of reapots. having entire control over the lives and property "if his sulijects. Wholesale murder is on of the chisf features in religions and state ceremonies, and the nost valued omaments of the royal resillace tre human skulls. As many as 2000 homan virtims are sometimes sacrificel at one 'grand eustom;' and the present king inmolated goon at tha Weath of his father. Of the regnlar army of 12,000 , alwnt onc-half are Amazons (devoten to celibacy), who are lescribed as much more effective suldiers than their male compraions in arms; bat at the sume time as boodthirsty and ferocious as tictusses. The ravenue, until recent years, lepemiled gratly mon the sale of slaves; but the vigilance of the cruisus emphoyerl to prevent the traffic, has reduced this source of income materially. Irenee the monst.er slaw-hunts which periolically took place in order to sumply slave-tradtrs, are now comparatively rare. Fop. estimated at 200,000 .-Aboney, the capital city, and the royal resilence, is situatel ahont lat. $7^{\circ} 30^{\circ}$ N., long. $1^{\circ} 40^{\prime} \mathrm{E}$. It is stated $t_{1}$ be eight miles in circumference, is surrounded ly a hitch, and elay walls, priecced by six gates, in each of which are two oprenings-one for the exelusive lassage of the king, the other for lis suljects. The humses are mostly of one story, built of clay, and thatched. There are no regular streets, each liouse standing within its own enclosure of clay wall. There are three palaces belonging to the king hare, which differ iittle from the other houses, save in their greater extent and higher roof. There are two markets, bat no shops. Farms are cultivatcel within the eity, its large space in proportion tor the polulation ( 30,000 ) admitting of this. See Furbes's Dahomey and the Dahomans (2 vols., Lond. 1851).

DA'HRA, a district of Algeria, once inhalriter? by the Ouled-Riahs, a Kabyle tribe. It has acpuired a melancloly cellority as the scene of a frightul massacre ferpetrated by the French in the month of June 1845. The district contains imuncuse caverns. In these the Oulet-Riahs, hotly pursued by the French under Colonel (ruw harshal) l'clissier, twok refuge. They were ordered to survender their arms and horses, and were promised, in retura, life and liverty. On their refusal, fascines were made up, kindled, and placol at the entrance of the carcs, Thrice Colonel leelissier sunt a flag of trace, exhorting the imprisoned Kables to accept his terms, hat in vain-the last messenger being rewived with a diseharge of musketry. The tire was therefore argin kindled in all its intensity, and gradually the erich of acony from the interin of the caverns ceasch, unth nothing broke the deal silence lat the occasional crackling if the green wool of which the fascines consisten. Whan the cavems were examincd, ahout boo dead loolies were found scattered here and there; but it was calculaterl that in all (including those who afterwards died and those who could not lie got at). abont 800 has been suffocated by smoke, or grom to death by the madenced cattle whom they had brought with them into their fatal asylum. The news ereated a great sensation in Paris. Marshal soult, then minister of war,
formally condomond the deed; lont Darshal Bugeand. the guvern of Algeria, affirmed that Pelissier hat only acted muler positive orkers.
MADM1E'L, a town of Span, in the province of ('imal lieal, twenty miles east-morth-east of the aty of that name. It is in general tulemaly woll hailt ; it has several squars, and its principal strects, thomsh mated, are wide and empraratively clean. Its chief laidings are the churches of kan ledro and sianta Naria-the fomer a Doric, and the latter a fothie structure-a town-hall, and a haspital. 1), is environed by tine pollic walks and cratens, aut has manfactures of womllens, linem, blande lace, dee lope abment 10,000 .
DABR-ELKAMAR, or HELR FLKAMH, a town in ryma, and the eapital of the breses, about 13 miles sonth-south-east of beyrout. It is situated on the edge of a deep aml jucturesque glen of Mame Lehamon, the banks of which and the slopes above are richly dad with mulberries, olves, and vines, which are coltivated in terraces by an excedinoly industrious propulation. On the ofposite shde of the glen stand the ruins of the pulace litemilin, fommerly the residence of Emir Beshir, wha, for more than half a century, from 1788 to $15 t 0$, muled over the Lebanon with a strong but inuartial hand. I'opnlation of I , about su00.

JAlliy, all that concerns milk and its management in a farm ; or the phace or house where the milk is kupt, cheese made, \&e. (The old word dey, the milkmaid who presidel over the eltemy or dairy, is mobaldy allied to rluy, a teat, and to Lat. duc-, to traw, or milk ; in Polish, sloie is to mill: : and in Sw., dejue is a darymand). Throuphot the hest cultivated alistricts Juth of England and sentland, the growing of corn and grem crops, and the roaring and foeding of stock, are now yenurally carried on in conjumetion with the dairy. Ths mixed system of hoshanley is certanily proluctive of better cultivation, and, morewer. divides the farmer's risks, ant enables him to make the most loth of his stock ond his land. Milk-cows, however, still ocoly the farmer's chacf attention, and dary-porince still pays the mat throughent most of Ayrshire, many parts of Lanark. shire, and most of the somth-western comatios of Gentland; mongst many of the smather tenants in the midhand dstricts of England; in the rich vale of Ayleshory; among the whl pastures and small cnchasures of the shath-western conntios; and in ('ork and the adjoining Irish provinces. I'ossessinif a mild monist climate, these gurtions of an islamel are better adated for pasture than for com, and have always been noted for their dary-produce.
The selection of eattle of a sort politalab for the lairy, is a $1^{\text {ninut of the dirst impuntance. 'rertan }}$ lirects have lones been famed for thoir millinit
 the Ayrshire. In proportion to their small size, aml the limated ambunt of food which they consume, thry yiehl a lage quantity of rich groni milk, and are highly mized hy the dicirymen of daserow ami wher ricnitish towns. The cisel, however, are of shall value, fur, unless the produce of shonthom

 Widly in Bhyland, ley thas who prize wich milk, and many farmers have ond on two ammant their heri

 Work, whln mstances neche of thor yiedting ins much at le of fths. The small hrittany bored,

been broncht to this country, and are profitable for gentlemen's families, and where cmly one or two cows are kejt. These breeds are, however, in little farour with those who, lresides lairying, lowk als, to the hreeding of proftable grazing-stiock. Many families of the short-horns minte, with size, sulbstance, and aptitnde for fattenin!, excellent milking properties. Short-horns, or ammals with a large infuswn of short-horn lhow, constitnte the halk of the hantsome amt hish-priced cows seen twice a weak in cur metromolitan market, and preferred to all others by the Lombon dairymen. Throughout the morth of Jindand, such convs are also in general favour. They are used ly Mr Horstall, whose "xellent papers on dairy management, published in the Jommal of tha Rioyal Agricultmal Society of buyland, shond be read by all interested in this sulject. With his liberal dietary, fifteen to twenty cons daily arerame for seven or cight months, ten or cleven puarts of milk, prodncing a pound of butter. Of late, howevor, many hreders of our more fashion. able and drize-taking short-horns have devoted their undivided attention to carly maturity, flesh, and " uality, nergecting altogether the milking properties. This is to be regrettinl. The original short-horms, in the hands of the Prothers Colling, Mr Bates, the Earl Dncie, and other earlier breders, were exeellent milkers ; and even at the present day certain familics are to be fomd still retaining their aneient character. The Herefords, althongh used for the dairy in their own and the aljoining eounties, are chietty famed for then goul working and feeding bullocks. The symmetical hood-red Devons are dairied in some of the sonthem counties, and are reputed fair milkers. The ancient long-homs, once common thronghant the midlame comaties, and much valued for milk, have now given daee to more compact, symmetrical, and poritable varieties. Some of the wher Sootish heods were also celelmated for their dairy qualities, and mone more so than the long shapely black Pife cows, ol which only a seattered fuw now remain. Amongst Angns, Calloways, and West Highlambers, good mille-cows may also be fund. Of hash brectls, the noat hardy black cow of lerry is well lonown, allke for the quantity and riclmess of its milk.
(ismel milliny animads of ewery breed possess certain pualities in common, which gnide the farmer in puditally recuitimy his dary-stock. They have noat, taperms, well-placed heals; small and rather narrow neels; light fore-guarters; oblique rather than muright shomhlers: large and shapely udder, well under the helly; largoly developed milkveins; a pliant mellow skin, well covered with soft silly laiar. "f grat impurtance, also, is the fact of the animals lwind Auscended of parents possessing gnnd milking qualities, for certainly no property is mone destinetly hereditary. The milk of small amb yonng cows is nsually ridher than that of larger or ohar anmals. From fur th seren is the most proditalle age for the lairyonw : after that, the milk is porro the animals tat more fool, especially laring winter ; and, marener, bueome less mofitalle whan rived for foediug. The stock is usually recruital hey luifurs herd on the farm, which are generally prefiened th these lought in. lioan amb rod chlours ane mont in farour, white animals lexing rather mome diduate and danty, especally as calyes and yameonds.
'rhen is mum theth in the old souttish adage, - Whatt gangs mat the mou [momith] maks the grot milk-rio [com].' In mo lepartment of the farm is Jibatal and reshlar management more satisfactory and bumbrathe: in nome are carelessuess and irre. gulaity nom, hart ful and minons. Toprohtuce large 'luatitues of gend mills, it is absolutely necessary
to supply the cow with the materials from which such milk can be casily dabrated. These wholy consist of allummons matemials amd phosinaters for forming the caselue, and wily matters for podacing the hutter. In the ondinary dutary erfomorosent in sufficient amonat to purnlut, withut wasto a copions flow of gent milk. Fows yivhline le ut
 alome, will repure daily the lioge amb wasteful moment of 28 or 30 His., and wen then, new mantan their comdition durnes the rarlier perinds of lactation. 'The ahlition of 201 lhs. of mangold of Swedes will not always perent loss of weight. A still greatur fallingotl in thesh and fat a canstant robbing in fact, of the materials of the homly to surply the secretion of milk is cobserved in the case of cows hept ou the Senteh system om straw and it fall allowance of tumips. Fmier better manafe. ment, the oxpensive hay and rows may he materially reduced in ruantity, amil the ale puate ammont of untriment suphied l,y such articles as han-thour. rape or cotton cakes, han, malt commbes, and the like; whilst suflicient lomik-an important matter in the feeding esprecially of ruminants-- is attanel liy the use of chopped straw. The cutting of staw into chalf is gralually commemding itself to all stock-masters; i larser amonat of straw is eatem, and thus hecomes nearly twice as valuable as when employed merely as litter. Bean-straw, when steamed or fermented with pulped or grated roots, loses entirely its bitter ilavom, and beiny rich in allmminous matters, is specially adapetel for milking-cows. A portion of the ronts, or all of them where the sungly is small. shouln ie pulperl, mixed with the cut chatf, and the mixture allowed to lie in a heap for a day or two before beind used. With the roots should le mhded 3 or 4 lhs. of rapecake and 2 lbs of hran for each cow. The moisture and flavour of the sueculent rowts bermeate the dry fool, inducing fermentation, with the development of sugar, and the mass thus beemes more palatable and digestible. Sometimes the mixture is stamed and given warm; and for milk-cows in cold weather, one or two suth messes given daily, mandly pary for the cost and tronble if stemang. Of the mixture thus fermented or stemed the enws should have as much as they can eat thrice a day. Cons in full milk, on antemend to be speedily fattened, should have sprinkled over it a small quantity of bean or wheat meal, to the extent of 1 lb . or even 2 lbs. daily, After each meal, give 3 lh s. of good mealow-hay, and le careful newo to allow of hay or anything else nore than can lus elearel up at once and with relish. In most parts, especially of England, cablage and greon rape form the best succulent fool for the first two winter-months; turnips and swedes for the next two: whilst mangold should serve nontil the erass is anment in spring; hut it shomb ever lue bone in minel, that animals thrive hest on varied and fremuently changed fook. A few feeds of mangolds, when the swedes are the staple root, and rice verme, besthes heing a fleasing variety, will he fomul to augment the quantity of the milk. lianc-cake answers for milk cows quite as well as the more expensive linseed cake. especially when its litter taste is got rid of, as already adrised, by fermenting or steaming. The dily matters of the rape being hearly the same as those present in good butter, may aceomet, as has been ingenionsly suguestecl dy Mr llorsfall, for its being specially suitahle fur milking-cows. This, in its main features, is the system of winter-feedins recommenteal by Mr Horsiall in his axellent papers abowe refervel to. We can also, from some consider. able expernence, testify to its merits, and inlieve
that all who have farsly tried it hase hawl fund reason to le satistion with the results. The increaserd prabue and comdition of the cows, with the ansmuntal value of the manure, re pays the tromble and mast. bach row in fill mulk daily consumms alwort

The summer-freting of enws is mon uatural and less expensive than the winter. ln the Emeliols dairy comenties, they are graze mon the nhl pastures, which are for this furpuse always meferren to thase more recently land duwn: whilst in fontlan they are pastured ufum the clowers. They shond never have to worle hard for their meals, and simmal further recivi in the bouse, when hrought in for milking, ent clover and rye-gass. Unliss in the case of very fine aml rich pastures, an allowance of raceake is alsur alvisalic. Such management not moly impones the yiele aml quality of tho milis. hat supports the cows in high condition, and maintans the pastures in hioh and inereasing fertihty. This last matter is worthy of consideration, for umber the ohler system, many of the one famed dairy-farms of Cheshire aml other counties have rapidly ifeclined in value. The tons of hutter ame these carried away from the suit have left it pur and unprotitable. In such circmostances, the use of bows and wherer such manures, by improving the combtion of the suil, have also gratly impored the nutritive quality of the grass amb hay. The ponduce of grom land in high combition is always more valmable alike for alary and for feeding purposes. It is worthy of remark, that a given acreage will suyport more aminals, if the produe be cut and brouglit to them, than if they are permitted to depasture it. 'The advantages of hoth systoms are, however, secured hy ruming the cows at grass during part of the day, and giving then cut clover in the hense durine the remainder. Thrompont the early anl later puat of the season, it is better that the animals loe out during the day, and in at night; bot in the intense heat of a warm summer, their leeing honsel in the day sechudes them from the attacks of trouble snme thes, and permits their grazing undisturled during the coul of the night.
A ghan suply of water is mocessary for milkens. Which require much mare than fectinsentuck. In winter, they shomh have aecess to it at least twice a lay, and reguire it stall oftener in summer. Adequate shelter, and comfortable and convenient luildings, are very essential to successful manacement. Cows locpt, as is still common in the south of Englant, even lurint an inclement winter, in "pen yards, on worse, on the hare damp peached pastures, cannot yirld rich milk under any system of freding: the materials which wacht to so to the formation of butter are wastefully spent in suppreting animal heat. Cows in tull milk are most protitahly kept in well-ventilated hyres or hevels, of which the winter temprature should fall little helow dif.
The heifer may lue put to the male when alnuat two years wh. The perind of gestation is nine exientar months, or 노 days, hat is nsually shorter in yonurs animals, and when the call is a fomale. buring pregnancy cows fortunately are little liable to distalse. Alwrtion measionally oceurs, and is most common alount the third or fourth month. The

## DAIRY.

heifor will receive the ortinary food of store-stock mentil within six or eight weeks of calving, when it will be profitable to diet ber as recommended for cows. It is a great mistake to starve cows in calt: half the summer passes before they recover from the effects of such marsimony. In older cows, especially if sood milkers, for a fortnight before calving, the bowels mist be kept relaxed, the teats lrawa, and any milk removed several times a day, and an oceasional dose of salts given. Such simple precantions will prevent that apoplectic form of milk-fever which destroys so many excellent mill-cows. The enlargement of the undler, and appearance of milk, the loosening of the ligaments of the pelvis, the relaxation of the vulva, and the anmal's evident desire to be alone, betoken the aproach of parturition. The act is cenerally accomplished speedily and easily, and withunt requiring much assistance. The calf usmally comes with its forelegs first, and its heat rather on one side, with the nose between the knees. The cow generally stands, and as the calf hops, the mavel-string is ruptimed. With a wisp of strow, the little animal is rubled dry, and recires cither from its mother, or from a foottle, a small quantity of the rich new milk purndaly known as the 'beastings' or cherry-curds, technically tormed the colostrum ( $\mathrm{q} . \mathrm{v}$ ). In this the caseine is mostly displaced by more easily digested albomen; whilst the large amome of surar and oily matter promotes the clearing out of the howels. Where valuable stock are reared, they are geverally suckled by their dam thrice daily for three weeks or a month; then receive from the bucket six or eight quarts of new malk twice a day, for which a portion of skim is gramually substituter, until, after three or for montlis, the milk is discontinned, aud the ammal subsists on grass, hay, of other such food, which in the meanwhile it has been leaning to eat. From the time the calf is a fortnight old, it should have a small box in its crib, and be tuice a day supulied with a few slices of Swedes or manguld, slininklerl with a little gromme wheat, bruised haseed-cake, watmeal, or any other such mutritive food. Rapid, contimoons, and healthy growth is thus insured; the calf is easily and safely weaned; and if such fecding is continned, the anmal goes on thriving, and, what is most impront, never. loses his calf"s flesh. To prevent calves sucking cach other, it is well to tie them un fur an hour after feeding. Those intended far veal should have plenty of new milk three times a day, as much wheat-meal as they will eat, and be tial up monstantly in a dark place. Rearing "alves shondel hot low tich n, as is tow often done in seotland, but have a confurtable, warm, well-littered, chereful, and frely ventilated honse. These or fore maty be plated together, lat wererowding must be seduhnsly aroilenl. The cow after calviner shamld have a drink of nual :mal tepid water, to which a little salt may be admed. For the tirst week, stemerd foonl, lanamaslics, with grom hay, eomstitute the hest form : routs at all times, ami cold water doring winter, are hast withhelf. Pleansing hrinks are quite mavallal for: and if the placentia do nont come away whthin twolve homs after salying, it may be vory fromerly and safely remownd by any" "nn ascustomin! tu such offiees.

In Enotianl, milking is manally dono by men, rjalto or ton cows lacing allotted to calch, ind the Oproation, excrpht in the vase of newly calved cows, briner repated whly night and momong. In sootlame, the mitking is dome by women, three timas it lity ; and morn milk is thas fot tham ly malking moly 1 was. "fla removiag of the whond of the milk at

dairymen aver that half their jrotit lies in carefully getting the last of the milk, which, as is well known, is much the richest. With liberal feeding, such as that above described, well-selected cows yield daily, in a fortaight or three wecks after calving, 12 to 16 quarts, and should continue to do so for six or eight months. Even with the same management, the milk of some cows is especially rich, and vields an tmusually large proportion of butter ; whilst others are equally remarkalile for the way they fill the cheese-tub. A quart of ordinary milk yields about an ounce of butter, and more in summer than in winter; but under good feeding, the amount reaches and "ven exceeds an ounce aud a lablf, and is tolerably equal at all seasons. A quart of new milk yields four ounces of curd; and in the midland counties of Eugland, each cow is estimaterl to produce 500 lbs . of cheese in the season.

In the successfil management of milk, butter, and cheese, much depends unon the dairy itself. It should hare, if practicable, a northern exposure. Proximity to sewers, pigsties, or any offensive smells, must be sedulonsly aroided. Stone and lime are the best materials. The walls may lee advantageously lined with a skirting of brick, or, where the cost is not objected to, with white glazed tiles. A lofty roof and free ventuation must be prosided, with windows looking north. A donble door is advisable-a light sparrad une placed inside, useful in summer for freely admitting plenty of air; and a solid, well-fitting, hoarded one, removable in summer, and necessary for keeping out the minter cold. The temperature of the dairy may be further moderated, in hot weather, by allowing a stream of cold water to trickle slowly over the floor, or, better still, round the milk-ressels, placed in large vats, and by hanging throughout the room coarse calico satimated with water several times a day. In winter, hot-water pipes, closerl doors, windows protected by straw, and such other apuliances, must be resorted to for the maintenance of the desirable temperature of from $50^{\circ}$ to $56^{\circ}$. Further to insure an courabe temperature, it is alvisable to shelter the building with trees and shrubs, and, if possible, have it foum or five feet below the level of the ground. No mimal food, drying clothes, or indeed ayything else, except mill, lutter, and newly made cheese, shonld ever enter its walls. To remove any acibty or noxious emanations, charcoal-poweler is sometimes liept strewed on the shelves. An anmal whitewashing of roof and walls belps to cleanse and purify. Daily must the toor and shelves bo thoronglly serublued and washed, and not a drop of spillel milk allowed to remain for many mintes umremoved. Dy far the neatest and best shelves are of stone or slate, two ame a half feet wifle, raised on stont imon rods abmut two feet from the lirieked or paved thors. The dishes are lest mate of earthenware, or oak limed with lead. Where many cows ar= kept, these last may he conveniontly malc thre feet widla, and form or tive foet lones. 'I'bey will thas project six inches wer the sholf, imot shombl be provilod with it lases plar, by which the milk,
 the vossils. Those, and the milk-louckets, amd, indered, "very artiche that comos in contace with milk su lontiox, must be kept scoupulously elean. Inmodiately after use, they shomhl be rinsed out with cold water, and therl with hot: woerkin and matal artichos well-scmucal with il wisp of straw, arain washed, or, where pacticable, dipued into a bular amomgst scalding water, aml then set aside fire sereral homes, to diry, air, and swaten. for sembiner purposes, tha plated wisp of straw is neatly profralde to the dish-cloths in contmon use, as it is mone likely to lee chamersi when foml.

The milk, when brourht into the dairy, is rum throngh a wire-gane or hors -hair strainer, into the vessels above deseribed. 'To chemarage the rapid rise of the cream, the layer of milk shouh be shallow, especially in summir. At the end of Iz or 24 hours, the eream is carefully removed; and in conl weather the milk micy stand for another 10 . ${ }^{\circ}$ 24 hours, when it is agin skimmed, the residue going to the pigg or calves. The cream removed at the first skimming is always richest and best; and where it is desired that the butter shonh be first-rate, any subsequent skimmings may be kipt separate, anil chamed by thomsclves. Chuming at short intervals of twice or thrice a week is preferable to allowing the cream to stamd for a fonger period. Every time ereaur is added, the contents of the tank or cistern are well stirred, and a little salt alded, unless, as in siontand, where the buttur is liked perfectly fresh. The erean shouk be kept as cool as possible, espreciatly during the several hours preceding chuming. For this end, in very hot weather, the cream-tank is sometimes lowered into a conveniently decp well, or placed for several hours in a water-cistem or under is ruming tap, In such weather, the churning, which generally occupies from 30 to to minates, should be done at aight, the butter laid in brine, and made up carly next morning. When the whole milk is kept for ehurning, care must be taken never to and new milk to that which has already been sour. Cheese-making requires so much time and labour, that it is nut very pomar anong the present generation of farmers' wives and daughters, and has of late years been rather on the decline. As with the manufacture of good butter, it requires careful atiention, precise regularity, and scrupulons cleanliness. See Cheese.
hailway communication has greatly cxtended, improved, and even cheapened the hairy supplies of London and other large towns. The might and early morning trains now carry thither fron distances of 60, 80 , or 100 miles, quantities of butter and wilk, the latter in large tins, which in hot weather are usually covered with wetted calico to promote evapmation, and thus keep the nilk cool aul swect. The management of the large dairies from which such supplies are mostly drawn, closely corres pomas with that described. The sale of the swect-milk is fornd to pay better than the making either of buttor or cheese. Quantity rather than quality of milk is usually the main requirement, and a liberal amount of soft succulent food is aceordingly used. Calves, as soon as dropped, are disposed of, ancl are carried for rearing into the grazing connties. When butter is made, it is usually from the whole milk, the butter-milk being used for feeding pigs. In London, Edinburgh, and other large towns, the dairymen keep their cows tied in the stall throughout the year, seldom retain them lunger than ten or twelve months, usually dispose of them either in a store or fat state so soon as the yield of milk does not pay for the feeding, purchase their fresh ones immediately before ar just after calving, pay particular attention in their sclection to the aprearance and size of the udder and other points indicating good milking properties, and attach great value to high condition, which presents materials readily convertible into the high selling milk. Cut grass, hay, or sonnd straw, roots raw and boiled, draff or lrewers' grains, with an ocensional allowance of flome or cake, form the staphe articles of diet. A considerable portion of the foosl is given in a soft slopy state, water is freely allowed, with frequent supphes of dres. better known in England as brewers' or distillers' Wash. By such diet, a maximum quantity of milk is ohtainci.

Fur further information, the reader is referred to the following works: Dairy Farming, by John C. Norton; Jhiry Monotgoment, by J. Horsfall, being a republication of the parres above alluded to (Lidgway): Jerioy Monngemment, liy Mrs Sontt (blackwood): artieles on Dairy Manasement in

 abl. Jatitude by medieval writers. Its most usual sipnilications are the following: 1. A candyy wer :ut altar, shrine, font, throne, stall, chair, statne, on the like. The term was applical to the canopy without regard to the materials of which it wats composed, which might Le eloth, wowl, stome, metal, or other substance, ․ Tla clief seat at the high table in a hall, witl the canopy which covered it, from which probably the word in all its significatiuns was introduced. its French meaninf being a canopy. 3. The ligh talble itself. t. The raisul portion of the Hoor, or estrult, on which the ligh table stood, and by which the uprer was diviled from the lower portion of the hall: and 5. A cloth of state for coverins a throne on talle. In ald writings, the word occasionally takes the fum of dois, and more rarely that of d $\quad$ o or dita.

DAI'sy (Dellis), a gemus of plants of the natural order Composite, sab-order Corymbifere. The common D. ( $B$. perennis), plentiful throughout Europe, Howers almost all the year in lastures, meadows, and grassy places. What are called double varieties, with tlowers of various and often brilliant colours, are very commonly caltivated in gardens, the Howers consisting entirely of torets of the ray. A variety ealled the $H$ Hen-ond-chickens D. frequent in cottage-gardens, has the tlower (head of howers) surrmated by snaller ones, the short stems of which grow from the summit of the serupe or leatless stem. The D. (Gouru of the Scotch) has long been a fayourite with poets and lovers of nature, characteristic as it is of many of the fairest summer scenes, its blossoms genming the pastures, and recommended also by its frequent appearance during the severer seasons of the year. Its llowers close at night. It is nut found in America. A species of Bellis is, however, found in the luited States (B. integrifolia), but it is confined to Tennessee, Arkansas, and the neighbonring regions. Europe prodnces some species unknown in Bratain, but of little interest; and species of the nearly allied genus Bellium are also fonnd in the sumth af Europe. In the days of chivalry, the D. was the emblem of fidelity in love, anil was frepuently borne at tourmaments both by knights and ladies.

DAisy, Michallams. See Astef.
DAKOTA, or DACOTAH (so called irum the Dacotah Indians or lacoits-see Indravs), a territory of the Tinited States. bomaded by Minnesota on the east, Nehraska on the south, Washington on the west, and the British passessions on the nonth. It was formerly 1 ,art of the territory of Minnesuta, but was detached when that became a state. D. is in length 400 miles, its average inealth is ahout ${ }^{2} \%$ miles, and it has an area of 70,060 square miles. The 45th degree of north latitude runs across the widule of the territory, which is watered by the Missouri and its branches. 1. inclndes open grassy plans, himh rolling prairies, and aboumels in gane furnishing valnable furs. The land is fertile and well-tinbured, and is rich in cual and other mimerals. The territory was only organised in $\mathbf{1 8 0 0}$, and as yet the country is lnt mearerly settled.

IMALIS＇MPLE FAMILY，is very old and

## DALIRYMPLE.

illnstrious Scottish family, deriving its name from the lauds of Dalrymple in dywhire. The principal members aro:

Dalrymble, James, Vhooext stam, a lawyer and statesman, son of a small propriter in Ayr. shire, was bonn at lorummmedic, in the same coments, May 1619, educated at (ilas,ow University, am at an early ase, enterel the army raisel in seotland to repel the religions immovations of "harles I. But the bent of his mind lay towards civil and literary pursuits; and in 16.41, he was apminted professor of philosophy at Gilasgow. The use which he made of philosophy, however, was rather to and him in hasing law- his favonrite stuly-on jrofonad and eowpreliensive principles, than to add another metaphysical system to those already in existence. In short, his wish was to be a philosophie lawyer, rather than a philosopher. In 1648, he entered as an :ulpocate at tho Scotel bar, where he rapidly aurqued great distinction; in 1649, and again in l (im), he was appointed secretary to the commissioners seat to Holland by the Sonttish parliament to treat with Charles II. ; and in 1657, was induced -lut with dithenlty-to hecome one of the 'commissioners for the administration of justice' in Scotland under Cromwell's rovernment. Dalrymple was a conscientious, but at the same time an exceedindy moderate and enlightened royalist; and althoush appointed one of the new Scoteh judgus after the liestoration, he resigned his seat in 1663 , because he could not take the 'Deelaration' oath, which denied the right of the nation to take mp arms against the king. IIs great talents, however, indueed the monarch to accept his services on his non terms. Dalrymple was now created a baronet. In 1671, he became Lorl I'resident of the Court of Session. As a member of the Privy Council, he was invariably the advocate, though not always suecessfully, of moderate measures. In 1651, when the infamous 'test' oath was under consideration, Dalrymple, with the dexterity of a lawrer, emused John Kinox's Confession of Faith to le introduced as a part of the test; hat as this Confession inculeated resistance to tyranny as a duty, the one half of the test contradieted the other. Dalrymple's private conscience, however, was more fastidions than his public one, for he himself refused to take the very oath which, ly lis ingenuity, he had virtually deprived of its despotic character, and in consequence had to resign all his apointments. Before this, he hat published the Institutions of the Law of Scolland, which is still the grand text-book of the Scotch lawyer. The disquisitions are both profound and huminous, characterised alike by their philosophic insight and their sound common sense. After some time spent on his estate in Wigtonshire, Dalrymple went to Holland in 1682, to escape the persecation to which he was suljecten at home. During 1681-1687, he published at Edinburghthough he himself was then residing at Leydenhis Decisions; and in 1686, at Leyden, a philosophie work in Latin, entitled Pingsologia Fora Experimentalis. He accompanied the Prince of Orange on his expedition to England. When watters were prosperonsly settled, Willian re-apointed hin Lord President of the Court of Session, and elevated him in the peerage noder the title of Viscount stair. It died 25 th November 1695.
Jonn D.hinmaple, edest son of the preceding, ledd office under James IL., and also under. William 111. While Secretary of State for Scotland, he incurred great odium on account of his share in the larbarous transaction known as the "Massacre of Glencoe.' In 1703, he was elevated to the cardom of Stain. He died in 1707.-Sir James Dalfrimple, second son of Visconnt Stair, was the author of

Follertions conerming, scotlish Jistory precrding the Secth of lheme l. (1705), and the grandrather of Sin John learymple of 'ranstom, anthor of that excellent work, Momaira af tiant liritain and

 son of the first bant of Stair, and grandan of Yiscount Sitair, was born at Elinbur,h, July 20 , 107:. He had the misfortune. While pones, to kill his ehlere brother, by the accilental diochares of a pistol. This mhapy cireumstance inducel the parents, both for their own comfurt and that of the boy himself, to educate him away from home. He was placed under the eare of a chargyman in Ayrshire, who, by his pudener and kinduas, soon developed the exeollent qualitics of the yonth. Dalrymple afterwarls went to leyden, wher ho had the reputation of being une of the best schatars in the university. II eompleted his curriculum at Elinlurgh. In 1701, he accepted a commission as lieutenant-colonel of the Senttish reniment of font-guards, and gained the lighest distinction in Alarlborouth's campaigns. When the aecession of the Toryministry, in 1711. pat a stop to the brilliant eareer of the great Auke, Dalrymple retired from the army. When George 1. succeeded to the throne, Dalrymple-who had become Earl of stair by the death of his father in 1707-was make a bord of the bedehamber, a prive-conneillor, and commander-in-chief of the forces of Scotland. Next year, las was sent as ambassudor to France, in which capracity he exhinited the highest ahility, and was of the greatest scrvice in traversing the schemes for the rinstatement of the Pretenter; lont as he refused to tlatter his comtryman, Law-notrious in connection with the fatal Mississipui scheme-who was then omnipotent in France, the government was mean enongh to recall him. For we vears he lived in retirement at Newliston, near Dlinburgh, Gewting himself chielly to arsiculture, which was then beginning to improse in scotland. Ne was the first to phant tumpes and cabbages in the open fielts. In 1742 , he was sent as ambassadur th Holland, and in the following year served muder (icorge 1l.. at the battle of Dettimen. Later, he was made commander-in-chief of the foress of Groat Britain. He died at Quennbery House, Elinhureh, !th Hay 1747.

Dabrample, Sir Divit, a Souttial julye ant historical antiquary, commnuly knum as Lome Hailes, was lorn at Edinburch, Osth October lielt. He was the gradson of sir havid lalrymple, youngest and reputedly the allest son of Viscount Stair. He was educated first at Eton, afterwarls at Elinburgh, and tinally at Leyden, whewe ho returned to Scotlam in 1540 . In 174s, he was called to the senttish lar. where his success was highly respectahle, but not astonishing. Iahromple was a nam of exteusive culture and classical tastes, of somni julgment, and great jolustry, hut a very indiferent orator; and, in consequence, men if far inferior powers often acquired a greater reputation and a more lncrative practice. In 1766, he was appointed whe of the judges of the Court of sersion, and assmed the title of Lord Ilailes, hy which be is chietly known to posterity. Ilis acemraey, diligence, jubieial improtiahty, and dignitied demeanour, seened him the highest respect in his nuw otlice. Ten years after, he was made a justiciary lord. He died anth November 1792.-Although Dahymphes ofticial duties were very arducus, he fomm time to compose numerous
works, surpassing in value those of many men whose lises hatse been wholly devated to literature. We can atfond to mention only a few: A Discomse on the Gourie Conspiraey (1757); Memorints ant Lettris rutimy to the History of Letain in the Reing of $I_{\text {unes }} I$. ( $1 \div 62$ ), a curions anil interesting volnme: The 1 Hows of the erer-memoruble John Ifuiles of Etom, d!. (17(in); Memoriuls and Letters relating to the Mistory of Britein in the Frign of Charles I. (1766); Amals if Srotlund from the Arcession of Multolm III., surianmel. Cienimore, to the Actession of liobert I. (17:6); and Annuls of Scollutel from the Alccession of Robert $f_{\text {., sumamed the Bruce, to the Accession of the }}$ House of stuurt ( 1775 ). Besides these, Dalrymple wrote works on legal antiguities and ancient chureh history, edited olf scotch Ioems, and published shetelies of the lives of varions notalle Scotehmen, as specimens of how a Bioprophice Scotice might be executed.
Inilfymile, Alexhnder, F.is.S., F.SA, younger brother of the preceting, was born at New Hailes, the seat of his father, near Edinburgh, 24th July 173. In 172. he obtained an appointment in the East 1 ntiar'ompanys service ; but his extreme youth, as well as the mperfect education he hat received at hime, rendered it necessary, on his reaching Madras, that he shmuld be placed mater the storekeeper for a time. Lord Figgot himself, at that time sovernar of the presidency, condescended to give Dim lessons in writing; lut fomg Talryzuple havins, unluctily for hiz own prospects, fallen upou some papers in the secretary's office relating to the commerce of the Eastem Archipelago. becane sn engrossed with the inportance of the sulject, that aiter some hickerings with his superiors, he relinquisher his appointment, and made a voyare of olscruation among the castern islamds. At sombon, in the conse of lis expedition, he concluded a commercial treaty with the sultan, which might have led to heneficial results: lont on his return in Ti62, he fomed political affars entirely changed, emall jox racing, and must of his intuential friends dead. The scheme, in consermence, poved a failure. In 176.5 , he returned to linitain. to urge its impurtance on the home-anthorities, lut dif mot sneceed. In 177. however, he was sont out to Maimes as a member of conncil, lont was recalled in two years, apparently without good reasno, for in 1799 he was appointed hydrographer to the East India C'ompany, and shortly after received io prosion. In 1793, when the Ahmiralty resulsom to estahlish a smilar ollice,
 within a short porioul of his death, which recurend 1!th June 1Sos, at Marylomone, London. Inalymphe wrote a vast umbler of letters, pamplats, \&o. contaming plans for the promotion of britisis commore in various parts of the womp, fulitical dissertations, aceounts of peomaphical expelitims, i\&: Ilis hbary was rich in works of navigation :umb geograpy, all of which were purehatach by thu Ahmiralty: His collection of poctry, alsn wery saluahbe, was dumitul in the libary at Now II:illes, as a family heirlome.

 whith $h_{10}$ contimall themenont his whole life. In
 Han physwal sumbes in the Now Colleme at ManWhater, where he chictly wsibenthurime the remainder of his life, thourh froiutntly employed, after isot,
in giving lectures on chemistry in several large towns. In the years 1808-1810, he julbished his
 to which he added a third part in 1827. In 1817, he was appointed president of the Literary and l'hilosophical Enciety at Mauchester, He was also a memlier of the Royaj Socicty, and of the Paris Academy, and, in 1833 , receised a pension of $£ 150$, afterwards raised to ${ }^{2} 300$. In the same year, D's friends and fellow-townsmen collected $£ 2000$, to raise a statne to his honour, which was executed ly Chantrey, and paced at the entrance of the Royal Institution in Danchester. D. was also honoured by the univer. sity of Oxiord with the degree of D.C.L., and with that of LL, D, by the university of Edinburgh. He died, universally respected, at Manchester, July $a^{-7}$, 1844. His chiei physical researches were those on the constitution of mixed gases, on the force of steam, on the clasticity of valours, and on the expansion of gases by heat. In chemistry, he distinguished himself lyy his progressive development of the Atomic Theory ( $\mathrm{q} . \uparrow$ ), as also by his rescarches on the absurption of gases ly water, on carbonic acid, earburetted hydrugen, \&c. His treatises are mostly contained in the Memoirs of the Literary and Philosophical socity of Manchester, the Philosonhical Trunsuctions, Nicholson's Philosophical Journal, and Thomson's Amals of Philosophy. Besides these, we have his Meteorological Essalis and Observations (Lond. 7793 ; 2d edit. 1534). D. was unguestionahly one of the greatest chemists that any conntry has produced. Frofound, 1 atient, and intuitive, he hall precisely the faculties requisite for a great scientific discoverer. His atomic theory clevated chemistry into a science. In his habits. D. was simple; in lis manners, grave and reserved, but kinily, ant distinguished by his truthfulness ancl integrity of character.

DAMAGES, in Law, are the pecumary recom. pense clamed on account of sutfering an injury through the act of another. 'Fhe peculiar constitution of the Enclinh common-law courts, which, till lately, prevented them in most cases from giving any other remedy than low way $D$., rendered the questions relatinir to this subject of unusual importance; but the progress of recent legislation has been in the direction of restricting actions for D. to the cases in which the restitution of property or enforcement of a right cannot be otherwise attainel. The Court of "hancery, on the other hand, could not give D., it conlit only enforce performance of an oblimation hy persmal restraint, and hence, according to the nature of the remely desirel, the suitor resoited to the one ,ir other court. In ficotlanl, the supreme comrt has alyays been able to give redress in either way.

Wher a sun ascertaincol in amont is ine, the antion is one not properly for 1., but of aclet. Bat wher the smm is not ascertamed, as where an injury has heen denn to a man's character or property, the aetion in wither comontry cmin oneral only lie for I), the anmut of which the injurel purty estimates. and which is determinol by the judgnent of the court, we verdict of a jury, suljeect to certain dixel maks which tha come have laid down, as the prociphe accordime to wheh the estimation is to be made. 'Iluess, it is owionsly impassible' to tetail here, and reforme mint he mime to the tidle of the sperial subjerts wht ni whin a claim may arise for such information as it is pacticalble to give. It may he ohsurad, howerer, that it is a wineral rule to rostriet tha amont of 15 . to that of the actual pecmniary loss, whower it amberemaned; and that neither in scodland nor burlanl will a stipulated proalty for brath of agremont lee accepted as duterninint the sum due for 11 , unless it shall appear, ly the use of the 1 (rmm 'as liquidated

## DAMAN-DAMASCUS.

damages, or some equivalent expressim, that hoth the parties had intembed to tix ond axively tha sum
 that the injury for which 1 . are clamed nurat have aflected the clamant imdividually and met mems as one of the gemeral pathic, althongh it is mot wasmat that the injiny should hava dano material hart to lime as this only affocts the amone of damaters. And the injury sullemed must have luen the: direct and immediate emseforane of the act hone ; if it has maly been a seemmlang or remote result of the act, no J. will be givell. And any act sumd m must lea an actual injustice; it is not mongh that it prohucers disadvantagenns results, if these arise only from doing what the party was justified in doning. D., therefore, may be sucd for in respect of a crime involving liability to eriminal funslument; hat in Eughant, in the case of a felony, wo ation for D. will lie aramst the oflember, beembe it is the duty of the complaimant to posecute him criminally. It is otherwise, howerer, in the ease of mistemeanours ; an action for 1 . is there inderendent of criminal proemedings. In Scotland, this is the rule in reference to every spectes of crime.

DAMA'N, a seaport town, movince of finzerat, Hindustan, belonging to the I'ortugnese. It stamis at the mouth of the Daman fimga, or Daman River, which rises in the Syadree Momutains, as the mper extremity of the Westem (ihants is eallem by the matives, in lat. $2 \mathrm{O}^{\prime}$ Il N ., aml long. $7 \mathrm{~B}^{\prime}$ 42. C. Common spring-tides give at loast thee. fathoms on the low, while outside is a roalstean of more than duable that depth. The harbour athords gonal shelter from the sonth-west monsoun, ame, as the neighbourhood is well-stocken with suitable timber, the people are largedy amployed in the mide ing and raimge of ships. The pecular drawback of the locality is the searcity, on rather the want, of fresh-water: The river, even when swollen hy the rains into an immolation, is brackish, and the wells likewise are so in some degree. Endonic fevers are the natural consequence. The place is fortificd with at rampart and bastions, and it is deseribed as having men, before the arrival of the whites, a town great am strong.'

DAMAN, on motlying pontion of the Pumah, rums about 300 miles alone the right or west bank of the Indus, extending bick, with an average hreadth of abont 60 miles, is far as the suliman Mountains. It stretches in N. lat. from $2 s^{3}$ t 10 to :30 20 , and in E. loug. from (0) 30 to $71^{\circ}-30$. In the absence of irrigation, the district in general is little better than a plain ot smowth, bare, hart claythe result of alternate inumdation and craporation. But when duly imigated, this baked and bumed surface becomes very productive, more especially in the strip of land-known as the Jorajat-which is nearest to the bordering stream.

DA'MAN (Hyrex), a geme of quadrupers, highty interestiog as a connecting link hetween the Liodentia and the Pachonfromote. On account on their small size, their thick fur, and their general appearace, they were always ranked among the former, till Cuvier fointed ont their essential agree ment. in dentition and anatomienl charaters, with the lattor, and assigued them a place next to the elephant and the rhinoceros, remarking, that exceptine the homs, they are little clec than rhinuceroses in manatur". ITe adds that they have quite simbin andars, lont the mper jaw has two stomt incisors curved downwards, and during youth, two very small canims, the lower jaw fone incisors without any canines.' The skull, alsu, and other boues of the heal, rescmble those of tho pachyderms. Tha muzzle is short; the cars. shont and romme. The

 are mevend suans of this ghang, matives of Atrina

 shopheme of the Wh Thestanent, the (obing (I. v.) ef the anthumend biolish wexion, an illostration of which will bu foman umber artiold Coss. The D. is momon in symin and I'alostine, whathinn rocky places, and sindterines itsolf in the homen of the rocks, but not burvowing, for which its foet aro not adapted. It is a timill harmoless ereature, quink and lively in its morments, completely herlivorns, easily domesticater, and, in endinement, reably eating liread, roots, froits, and herlis. It is abmit eleven inches lones, and ten inches high; ]rowninh. gray alow, white leneath, the thek hair intersucrsed with louse seatered bristles. The Ashrewo (II. Aldyssinicus) of Abyssinia, first describer by Bruce, and suppused ly lim to be the shaphan, is now believed to be distinct from the Syian 1)., althongh very similar. The kerp-10sisil: (Hannousis) of sonth firica differs from the shaphan in its damer colonr ame wather larecer size and also in hasing only three toes on each foot, wherens the syaian W. has fond toce on the fore-feet and these on the himdfeet. It is very common in rocky paces in someth Africa, buth on the hills and wat the seashore. Its favonrate foud consists of ammatic plants, and its flesh, althongh eatable, is highly flawured. In the places whiel it frergents, a preculiar sul, stance called Ifyracrem (1. \& . ) is fomm-an animal secretion, to which medicmal virtuess are ascriljed, but the mature amb wigin of which have not yet been thonoughly aseertaimed.

DAMA'I, a town of Semen, Arabia, pleasantly sitnated on an clevation about 1 20 miles north-northwest of Aden. It has abont 5000 houses, is tho residence of a covernor, and has a collese, attended by sevcral hundred students.

DAMASCE'NUS, Jomnxes, the anthu of the stamlarel text-hook of Dugmatic Theoluey in the Greek C'mmeh, was born at Damescus alwht 700 A. I, On acconnt of his elorquence, he was surnamed a 'hoysorchoos ("(x,den Stream'). In 7a, he heeame a monk in the convent of St saba at Jorusalom, where he spent the rest of his days in the compusition of theological works. He diad abent 7ots A.3.. and hat the homar of leines camonect by hoth the Latim and Greek charehes. In. wats an man of extensive ermition, and was consideral the ablest philwsopher of his time ; lat the wom ' phiknopher' must have meant somethines very different in thos: days from what it does mow, is 1 ,'s writhes are characterised lỵ weakuss of jubloment auk want of critical pensis. The luest atition is that of I. Quien (2s vols., I'mis. İlo.
 of suria, the lamest in Asiatic Turkey, octupnos a situation of manalled banty (on a huxmmant pam at the eastern hase of the Anti-Iihams, aml in miles cart-smuthomet of Jeyront, which forms its
 atree of the city fom a chistance is leatitul in the
 beneath a "Eyrian sum, rise out of a sea of wamber tinted folder while all aromel-save on the northwest. Where stretches the long lare snow- whinte ridge of the Anti-Ledranon-extend charming gardens,
rich enraficleds, and blooming orchards, with the riser larrada (the Ahana of Scripture) and its branches winding through imtil ther lose themselves far to the east in the Lake Bahr-el-Merj, into which the Phege (the Pharpar of Seripture), a smaller stream, also flows. As in the case of all castern citics, the expectations excited ly a distant view of 1), are hy no means reatised on a close inspection. The city proper is alout 6 miles in circumference, and is prartly surromded by oled tumble-down walls, portions of which date from early Roman times, while other parts are of Saracewic arclistecture, and some mere numbatches of the wresent day. The streets genemilly are dirty and decayed, and so very narrow that a loaied thonkey almost entirely blocks up, the passare. The hest street is 'Straight Sireet,' mentimed in the Acts of the Apostles in connection with st Panl. The houses for the most part are very mean-looking structures, often mesenting to the street nothing but a dead-wall with a dorway in it, while the hest have romech mud-walls, with a projecting upper story extenting so far over the narrow street that lands may be shaken from oplusite windows. But as the interior of the city presents a sad contrast to its charming suromedings, so do the rich interiors of the houses contrast with the miserable externals. Fine marble-paved courts wamented with trees, shrubs, and foumtains, roms with aralvesqued roofs and walls, most Inxuriously fumished, are the common features of all the dwellings of the wealthier classes. The ${ }^{\text {rincipal }}$ buildings of D . are places of worship, chief of which is the Great liosque-formerly a heathen temple, then a Christian chureh-composed of different kinds of architecture, and occupying ar ruadrangle 163 yards by 105 yards, the interior dimensions being 431 fect by 125 . The floor is of marble tesselated, and covered with Persian earpets, and the walls and piers of the transept are euriched with beatiful devices formed of yarious colnored marbles, while rows of noble Corinthian pillars divide the interior into nave and aisles. Altnsether. this is on: of the handsomest ecclesiastical builtinss of which Mohammedans ean boast. The citadel is large aut imposing, but not strong: and the Gruat Khan is a splundid buiding, erected of back and white anarhle, There are miny interesting remains of antiquity in 7 )., hat they are lost amil the pean modern itructues and the lrazars. The latter are numerons, and fincr than thase of (Gairo or Constantimopte, and icry well supplicel with goods of European as well as Oriental manufacture; eath class of gools having a street or 1, azaner for itself. persons, and selling many of the women into Turkish harems. The imports of Eritish goods, chiefly lain and printed calicoes, cotton handkerchiefs, and cotton rarn, were approximately valued in 1855 by the Pritish consul at $£ 150,000$. The population of D., inchuding the adjoining village of Salahiyel, is stated at 150,000 , of whom about 130,000 are Mohammedans, 15,000 Christians, and 5000 Jews.
D. is perhaps the monst ancient city in the world. Josep has attributes its fonndation to Uz, the greatgrandson of Noah; hut whether it dates so far back or not, it is certain that it was a place of consequence in the days of Ahraham. Dariug the time of the IIelrew monarchy, it was the capital of Syria. It afterwards passed successively under the rule of the Assyrians, Persians, Macedomians, Pomans, and Saracens; and finally, in 1516, it was captured by the Turks under Sultan Selim I.-in whose hands, with the exeeption of a short interval (from 1832 to 1810), when it belonged to the Pasha of Egypt, it has remained ever sime. Under every change of dymasty and every form of government, $\mathbf{D}$., unlike most cities, has retaimed its prosperity.

The pashalic of $D$. comprises all the territor? between the Lebanon and the Euphrates-that is, all between lat. $31^{\circ}-36^{\circ} \mathrm{N}$., and long. $35^{\circ}-41^{\circ} \mathrm{E}$. The surface is for the most part level and very fertile, and produces grain of various kinds, hemp, thax, silk, cotton, wadder, tobaceo, and cochincal. It is considered the most important pashalie of Turkey, and its pasha takes high rank at the Ottoman court. Pop. about 500,000 .

OAMASK, the name given to all textile falries in which figures of flowers, frusts, or others not of geometrical regularity, are woven. The word is supposed to be derivel from the eity of Damascus having been au early seat of these manufactures. From the intricaey of the early process, the art of $D$. weaving was long a mystery confined to a few localities; but since the introduction of the Jacquard-machine, it is extensively employed wherever ormament is wanted in the stntts ased for dress or house-furnishings. The rich satins and brocades of Lyou and Spitalfields, the flowered ribbons of Corentry, and the bed and window eurtains of Halifax and Bradford, are all examples of D. manufacture; but it is in the deproment of table-linen that the art has had its widest scopre and greatest trimmphs. The principal seats of the manufacture, on the continent of Eurone, are at C'ourtrai and Liege in Belgium, and in some parts of Saxony, Silesia, and Austria : in Eucland, to an inconsiderable cxtent at Parnsley, in Yorkshire ; in Ireland, at Delfast, hishmre, and Ardoyn; and in Scotland, at Dunfermline, which may be calded the metronolis of the manfacture, the production of that town being at least equal to that of all karnue, ane factory there turning ont 10,000 yards duily ly steam-power alone, besides a large cmantity ly hand-wne and employing about 1400 hamds.

There are thre deseriptions of 1 . known in the foud-viz, I. Full Harnoss, which is generally muluya in patterns of limited size and minute detail, the prenliarity being that the Jacepard-machine inly hifts one threat by each neciln, and in such cises, the pattern is repeated to lill 19, the lowhith wanted. 2. . Single' or ('ommon' D., in which any number of threads, from two tu sewen, can lu lifted by one needle, to form the pathorn; whike the gramer is proTumed ly a set of live shatis and heddles, giving from lwice to veren times the extent of pattern whand from the same mathine ly the full-harness prowess la full ham"ss and single 1). goods, a square falmie is considered the proper medinm, that
is, the warp and weft equal ; but sometines a thread
 inef to the effect wanded to be mentheerh. $\therefore$ In Domble D., the patturn is promerod in the sume way as in single, and the groume formen ly vight shafts and beddles, forminer what the weavers dall an viehtleaved twill, absorthose mbehalf more weft that wapp, and giving that lime sathelik" grombl which

To mive ala blear of the eapital requaces 10
 mentiomed, that it is quite usual for the mome
 and dothas been pail for some extensive designs; while it is known that one pattem lately execnted cost tome of outlay, are a yard of ehoth could 1we bronght to market, emphoyinge seven Jacpuardmachines, coosuming 50,000 cords, and containing 4S00 threads in the sifuare yard. No statisties of the trade bave been collected since ls3if, when there were in Inmfermbine 3000 D ., and 517 diazel. Jooms, and the capitat emharked in the trade was estinated at $£ 5: 0,261$, and the total number of prorsons cmployed 5041 . Since then, from the introduction of steam-power, the hand-looms have recreatsed; but the nomber of hands euployed, and the ralue of the goods manofactureh, have greatly increased.

DAMISKEF'NING, of IDAJISCENJNG, is the art of producing upon ordinary steel certain ornameutal appearances resembling those olserved on the famons Damasens blates. Attention was first drawn to this branch of imelustry ly the Crnsadus, who bronght froun Damaseus to Hurope many articles made of superior sted, such as sword-blades and diggers. 'These wore fonad to possess not ouly great elasticity, united with consideralile hardness, but their surfaces were eovered with beautiful designs, formed by a tissme of darli lines on a light groumb, or light lines urom a dark sromm, and oceasionally ly the inlaying of gold on the stecl-blue grommil. These Damascus blandes "ppeal to bave heen constructed of stred amd iron welded together; and the elerant designs were bronght ont by immersing the hadesin clinte acids, which, eatins away mequally the surface, cave rise to the montled appearance. In gemmine Timmasens. blades, the designs rum through the snostance of the blade, and the watrimi, or remalar, almost symmetrical fygwing is not wore off lyy friction, or evell grimding. Imitations of the watering of Damascus sted are prodnced od common stcel by etching with acids; aml in thes way lamlscapes, inseripions, and ormarents, and demorations in general, are imprinted oo thr sted-lone ground, Cold and silver are also iulaid in the higher-class of swowlblades and other artiches. Gmolbarrels are oceasionally sulijected to the process of Damaskewing. Attempts lave leen nawle in France to acemmphish damaskeming by means of photorraply, but as yot with very imperfect results.
I) ANIASUS, ST, Bishop of Rome, was loy extraction a spaniard, and born pobably early in the 4th century. In 366 A.ir, he was elected Bishnp of lame, lint liad to struggle tiercely fon the Jusstssion uf his oflice with one Ursimus, who was supharted by a considerable party. Il is carcer Wias throughnot far from peaceful. It was mainly spent in sulduing the still anmerous Arians in the West; in combating the leresy of Apollinaris, which

winged, not at the end, but on ane side. The tree from which the name, originally alplien to its resinuas protuct, has been extenided to the whole gemus, is the Molfceax D. (D). orimentis), which grows on the high mountain-ridges of the Molucea islands. It grows to a great height, attains a diameter of nine feet, and gencrally has the lower part of the trunk leset with knots as large as a man's heal. The timher is light and of inferior Inality; anl the tree is chesly raluable for its resin, which is soft, transparent, hardens in a few days, and is then white, with a crystalline appearance. The resin often flows spmaneously from the tree in such quantity, that it hangs in masses like icicles of a handbrealth and a foot long. At another perion of the yar, it is yellow, and less valuel. By incision, especially in the protnberances of the stem, it is olitained in large pieces. So long as Dummer hesin is soft, it has a strong smell; hut loses it when it dries. It contains only a trace of volathe cil. lat consists of two distinct resins, one of which is soluble in alcohol, the other not. It is light, brittle, and easily friable, readily soluble in oil of turpentine, quickíy becomes viscil when heatent; when sprinkled on burning conl, diffuses an char like that of rosin or mastich; readily takes fire, and bmos with much smoke and a somewhat acid smell. It is used in Asia for domestic purposes; and in the arts like other resins; it is an article of commerce, anl in Lurope is employed in various ways to furm varnishes, which iny guickly, have a very Iright lustre, and being culonrless, allow the beauty of the colons over which they are sureat to be Ierfectly seen; but readly become viscid again, and are not permanent, so that this resin camot le made a substitute for copal and amber. It is almost completely soluble in benzole, and in this solvent, makes an excellent colourless varnish fur positive fihotographs on glass-it is, however, scarcely hard enongh for neratives.-To this grens leclongs also the Kauri Pine (4. vo) of New Zealamd (ID. censtralis), which prolnces the resin known as Kauri Resin, or Kami Gum.-The word Dammar. Dammer, or Damor, signities resin in some of the languages of India. The resin known as biank Dament is olbtainel in the Molucea Ishads from the trink of Marignice ocutiolite, a tree of the natman order Ampriducer. It is a semi-tluid suit resin, with a strons smell, becoming black when it dries: it is used is piteln, also to yielel a kind of turpentinc, which is obtained by ilistillation.-- Cenasimm mierocurpma a tree of the same order. also in natuve of the furthest cast, vields, by incision uf the trunk, is viscirl, onlorons, relowish substanee, very simblar to Lalsam of Copaisa, which is ealle Deimer or Denmar, and is uscel in haval yards ats whm, beime mixel with a little chatle and the bark of reeds, and beemes as hard as a stome..- (Quitudistinct from all these is the resin also callen Dommer ur Piney Dermmer in holia, when also

many of his best prose efforts, was eommenced in ib2l, hut proving a failure in a commereial point if riew, was soon discontinuel. Daving at an earlice date pullishell the Dying liaven, a puem of great merit, he came forward. in 1s2\%, with the Bucancor, and other pocms. U1,on these his reputation prineipally rests. In $18 \% 3$, he pullishlect a volume of his previous writings, both pruse and yerse, and since that time has written little. I)., in 1599-1841, deliverel in Boston and Xew York a series of well-received lectures on Shakspeare--lacuard H. Dava, the son of D., is well known as the author of Tuo Years byfore the Must.

DANAE , the danghtr of Acrisius, king of Argos, and Ocaleia. According to the mythological narrative, an oracle had anoonced that she would we day give hirth to a son, who should kill his grandfather, Acrisius, of course, felt extremely uncomfortable after this declaration, and took every precantion to keep D. a virsin. He shat her ap in a wumgen, where, nevertheless, sloe was visited by Zens in a shower of goth, and beeame, in consequence, the muther uf Persens. Acrisius put both the mother and child into a chest, and exposed them on the sea. The chest, however, drifted ashore on the island uf seriphos, and I). and her child were saved. D. remained in the island until Perseus hal grown up and become a hero famous fir his expluits. She aftermarels aceomanied him to Argos. On his arrival, Acrisins Hed, lant was sulusequently slain by Persens at Larissa.

DA'NAUS, a mythical personage, the son of Belus and Anchinois, brother of Foyptus, and originally ruter of Libya. Thinking bis life in danger from the machinations of his brother, he ded to Argos, accompanied by his fifty danghters, known as the llanaldes, where he was chosen king, after the banishment of frelanor, the last of the lnachinke. The fifty sons of Egyitns followed him. and under the pretence of friendship, sought the hand of luis danderters in marriage. 1). consented, inat on the halad-night he gave his daughters earh a dagser, and urgen them to murder their Driderroms in revenge for the treatment he had received from Frgptis. All did so, except one, 11 ypermnestra, who illowed her betrothed, lyneens, to eseape. D., as may maturally be surpmed, found oreat dificulty in olitaining wew huskmis for his clangters; and in order to gret them off his hands, institatel games, where they were miven as rewaris to the vieturs, although they coull samecly have been considerel very temptint prizes. As a jmish. ment for their crime, they were compulten, in the momer-worth, to pour watur fore ever intor a vessel full of holes. sor runs the myth; lat Stralor mentions aut oh tradition, which declares 1 . and his fifty danghtors to have povided Argns with watom, which is probally the origin of the seche in Ilalles. Greck irt, of comrse, reprosents the limailes in comformity with the perpular myth. The tomb of 1)., in thi Agura of Arions, was shewn as late as the time of limsauias.

'Christ Walking on the Sea;' in 1527, 'The Embarkation "f 'leopatra on the Cyclus;' and in 1828 -1509. 'An Attempt to 11hastrate the opening of the screnth seal,' 'The Passage of the lied Sea,' and 'The beluge.' Circumstances now indncei him to visit the continent, where he resided till 1841, during which interval be exceuted very few paintings. On his return, he took up his aboule at Exmonth, where he lass since lived. Among his later works, may be mentimed, 'A Mornint at Fhodes' (1S41), 'The Eachanted Island' (15:1). The Contest of the Lyre and l'ipe in the Valley of Tempe ( $15 \times 2$ ). "The Tombl of Christ after the Resurrection,' ' Fiensford Lake (Norway) - a Sudden Stum jrassing oft', 'Cains Marius among the liums of Carthage' (ISts), and 'The Departure of Ulysses from lthaca' (1854).
D.ANCE OF DEATH (Lat. Chorea IIachabroom, Fr. Lu Dunse Macabre), a name given to a certain class of allegorical representations, illustrative of the universal jower of beath, and dating from the 14th century: When the introfluction of Christianty first banishat the ancient Germanic conception of a future state, a new deseription of leath-myth. ology arose, partly out of biblieal sources, $\boldsymbol{l}^{\text {artly }}$ ont of the popular character itsclf, wherein the Last Enemy was represented under simple and majestic images, such as that of a husbandman watering the ground with lhow, phouhing it with swords, rooting out weeds, jhucking up flowers, or felling trees, sowing it with corjses; or of a monarch assembling his armies, making war, taking prisoners, invitime his subjects to a festival, or citing them to judement. But with a gralual change in national manners eame a change in the mode of treating the subject, ami it was associateel with everyday images, such as the confessimmal, cherss playing, and above all, with the adjuncts of a festival-viz, music aud danciug. Tlois tendency to familiarise the theme increased daring the confusion and tummol of the 1 'th $\mathrm{c}_{\text {. }}$, when the national mind alternated hetween fits of devotiou and licence, or blent both elements in sative ami limoma Such a mood as this naturally oceupicd itself with bersumifying Death, and alnpted by preference the most stirtling and grotesigue images it could fiud-. that of a musician playins to dancing-men, or a dancer leading them on: and as the dance and the drana were then intimately eonnecterl, and employed an religinus occasions, this particular idea som assmmed a dramatic form.

This drana was must simply constructed, consisting of short dialogues betwern beath and four-andtwenty or more followers, and was undoulatedly chactell in or near clurches by relinious orders in Gemany during the 1 the e, and at a mother later perimi in Frame. It would appar that the seyan brothers, whose martyram is recorled in the 7 th
 an impertant part in the drama, or the tirst representathon, which tom place at l'aris in the (lonster "etus Inmoconto," fell ugon thuir festival, and hence the urigin of the ancingt name, Chorea Machabe-

 We se: 2t fienres, [atly chacal, part]y las, armanged in a doseemling senle, from the prow limuself down to it lidte child, and betwon each of them a dancing fienme of lbatle, not in the form of a skeletom, bat a shriveded woppe, the whole being linked in one - Wain, and dascine to the music of another I eath. This representation is almost the same as a very anciont one at 1 a Chaise-Dien, in Anverge, and pmints to the identity of the original dramatic spetacle in both cometries.
"Ihe celcbrated Dance of I math on the cloister" walls of the limgenthal, a convent in liasel, thomeh painted prolnably not later than $1: 30$, exhibited a heparture from the simplest form-the number of pursons exceerling the original 24 , anel the chain froing broken mp into sequrate couples. But both alike are only to lre regaded as scenes from a drama, :aml cannot, therefore, be justly compared with a contemporary ltalian painting, the: "Triumph of Eenth," ly Andrea Orcagna. And the acted diama enduring till the 15 th e, we find that while thore were sameties in the pantings, the poem, which was the most important feature, remained almost mehanged.

- bout the mildile of the linth c, howrover, the arama being altogether laid aside, the pietures bueame the main print of interest, the verses merely sulbsidiary. Accordingly, we limb from this time the same pictures repeated in dillerent places, with dillerent verses, or no surses at all, till at Jength both verses and pictures entirely chancu thein orisinal character. The Dance of Death lecing transtorred from the quiet convent walls anto pultic places, gave a now impulse to pronlar ant. Dake Cicorge of soxony liok, in 150 st , the front of his Oreselen castle orinamented with a life-size lias-pelief of the subject, and other representations are to be found at Strashurg and Bern. Theve was a bance of Death painted round the eloister of ohl st Pitalds in Lemdon, in the reism of Flenry YI, : and there is a seulptured one at honen, in the cemutery of St Maclous. But loblnein has the eremit of availing himself most eflectively of the original design, and giviug it a now and mow artistic character. beparting from the idea of a dance, he illustrated the subject ly 58 distinct sketches for ensraviners, which he called 'lmagines Nortis." The originals of these are at $S_{4}$ letersburg, and impressions of them have been frequently rejeated under difterent names.

We may cite as authorities un this subject, Pugrnot's hecherdes sum les Itmaes des Mors (I) ijon and l'aris, $1 b^{* s}(\hat{b})$; Xassman's Easela Tohlentanze (Ntuttiart, 1547 ), anll Homee's The Dunce vi Diuth (1umb. 1sini.

 dancess. 'The Jewish reemmls malar abomanit mention of dancing. Moses and Mirima dinced to their sonif of trimoph, whon the Isratites [assell throwla the Jied sea as on dry land; lownd danced before the Ark. It is certain that the primative Christians danced at their religions meetinge, thomg we have no mention of this in the New festament. The Grecks made the art of danciug into a system expressive of all the diflerent passions, the dance of the Eumenides, or Furies, especially, creating such terror, that the spectators seemed to see thrse dreaded deities about to execute I Tearen's rengenne on earth. The most eminent Greek seulptors diel not disulain to study the attitudes of the pablic dancers for their art of imitating the passions. In Homer, we read of dancing and masic at cotortinments. Aristotle ranks daneing with joetry, aml says, in his Poetics, that there ore danecrs who, by mythm aphied to gesture, express mamers, passions, and actions. In lindar, Apollo is called the dancer ; and Jupiter himself, in a Grek lime, is represented as in the act of danciner 'The spurtans had a law olliging prants to axerese their children in danciner from the are of tive. Fhis was done in the public place, to train them for the armed-dance. They were led by grown men, and all sang hymas aud songs as they danceri. The young men danced the lymbie damee, in fome parts, cxpressive of orertaking an enemy and of it inuck-firfht.

Dancing, as an entertainment in prisale society, was performed in ancient times mustly by prafissional damecrs, and not by the comanay thems selves. Amonis the sedate Tomans, in fact, it was considered disgraceful for a free eitizarn tu dince, except in connection with redgion. Ilasing mofessimal dancers at entertammonts is still the practice among lastern uations. In lapot there are danciuer and singiner girls, called Ahm, win improvise verses as in ltaly. They are hinhly edneated, and no festival takes place without them. Thoy are places in ar rostrum, amb sine during the repast; then desemul, and form tames that have no resemblance to mats. All arer latia there are Nauteh girls or Baynderex (il. v.), who danee at festivals and solemuities.

It is amony savaze nations that the jasion fur dancins is most stromy manifested. There daness are mostly anonciated with religion aml war: and tho perfomers work themselves into ? state of frantic excitement-a kimb uf meenhanieal intosication. As civilisation alvanees, dameine-matemr dameing. at leart-assumes a mume and Dure sulmbed character. As a subal ammemont and a loalthoi vercise. danemy has much tor revommend it; the chit drawhatas are the ill-rentalated and werheated rooms in which it is Eencrally perfurmed. lis many, it is mafarmumbly regaved in a moral point of view: hint this seems a relic of that outburst of puritamom that characterised the 17 th c., and which saw sin in every joyous excitement. Dancing

## DANKALI-DANTE.

compensation for the national humiliation and reverses of the present. The first printed collection of the Kiemperiser is due to the royal historiogropher, Vedel, and appeared at Ribe, Fon? : another edition (''openh. 1605) by Peter Syy fonnd its way to almost every peasant's cottage ; but the most complete of any is probally that by Nyermp and Rabek. in 5 vols. (Copenh. IS10-1814). After the lieformation, the national literature was coniparatively neglected, for the composition of poor theolorical treatises and bald versions of the Palms. Anong the best of the writers in this department we may instance Christian Pedersen (born 1480), who, after baving made a metrical version of the ancient national chmaicles, devoted himself to the diffision of the Lutheran faith, and made Danish translations of the New Testament, and the reformer, Hans Taussen (horn I 4.4), who composed catechisms, and translated the Pentateuch into Danish. The Danish language achured stahility and new life ly the translation of the whole Bille, which, hy order of King Christian III., was effected in 1550 hy lalladius and other professors of the university. 'The close of the J6th c . was memorable for the many almirable writers on history which it produced in Denmark. Amone those who edited and anovaterl the ancient Danish and Icelandic historical chronicles, we may mention Peder Claussen, A. S. Vedel, and Axil Hvitfeldt, whose respective works supply invaluable materials to the historieal inquirer. These men were contemporaries of the great astronomer, Tycho Brale, and, like him, experienced the eaprices of court-favom: The 17th c. shews a large number of able writers, amons whom were Longomontanus, the pupil of 'Tycho Brahe: the family of Dartholin, mmbering seventeen in three generations, who were all known for the alditity of their writings on medical, philosophienl, and mathematical suljects in Latin, German, and Danish; the family of the Pomtoppidans, eleven in nomber, all of whom have left memorials of their proficiency in philolngy and history, and of their acquaintance with the theology and natural history of the times; Arreboe, the father of Danish poetry: who wrote on sacred suljects, and in his principel work, Mexameron, described in epic verse the events uf the first six lays of creatim; Steno, the ana. tomist, and the lyrical poet, T. Kinco. A new era began with the genial and versatile lumbir Holberg (I worn 1684), who wrote in Latin, Frenelh, German, and Danish, and has left very numerons works on history, biography, and topmraplyy, but whose fame among his countrymen will ever rest on his inimitahle comedies, farces, and satirical compusitions. Itis genins and his writings gave an impetus to the cultivation of the Danish languare, which not all the studied neglect of the conrtparty, and their persistence in the nse of Gemm, conhl check. The lathe pernduced many rome historical critics -as, for instance, Torfeus, Lamgelok, Sichoming, and 'uhm, Magnens, the Icelanlic scholar, Thorlarius, and 'Thorkelin, learned in ancient morthem low, amd fasenvince, the jurist, Ameng the epic and hramatice prets of that age, Wabla stands forpmost, whose national lyries arinee trne prectic genins. The chan of the entury was, however, mafavorable to mondel hevelopment and freedom of thought; and the loset writers, as in the case of Malte Brunn and the pow llabere, were cither comperlled to leave the mantry, or to alstain from giving "xpessien to their Mninns. Among the more rocont writers, we may instance the prot orhlonsehti ser-whose national tramdes and lyrical lesends of sumdinatian mytholowy hater rekimeled all the lone shmbering fire of Wanish patriotimu-banesen, Winther, Ibanch, F. 12. Mithr, Heilure, Harte, II. © Aharsen, Rosenhof, Ilolst, and Gwerskne Ingemam, who stands 111
first as a writer of historical novels, has also written good lyrics, and his subjects have generally leen taken from the national history. Short tales or novellettes wonld seem, however, to le more conceuial to the taste of the Dames, and most of their best writers of fiction have adopted this form-as, for instance, Blicher, Heiberg, Trane, Andersen, Winther, Carit Etlar, \&c. The names of Oersted, Schouw, Forchlammer, Rask, Finu Magmussen, Worsaa, Grundtvig, Petersen, and Eschricht, sufficiently attest the stand that the physical sciences, philology and archeology, have attained in Denmank in the present day. Thorwaldsen, by the gift of his works to the nation, has created a taste and appreciation for sculpture and the arts generally among his countrymen, to which they were previously strangers, and has thus given a new dircetion to the muntal culture of the Danes.

The Danish laugnage is peculianly soft, from the great number (ten) of distinct vowel-soumls which it contains, the absence of gutturals, and the softening of all the consonants. It may be said to lear the same relation to the ancient tongue, the Forrane or Donsk Tunge, that Italian does to Latin, force and precise inflections baving been sacrificel for melody and simplicity.

DANKALI', an independent state of Abyssibia, extending along the south-west border of the led sa, between lat. $13^{\circ}-15^{\circ} 30^{\prime}$ N., a range of mountains rmnning almost parallel to the coast, and abont 50) miles distant from it, forming its bomdary inland. D. is a sterile territory, being almost quite destitute of water. The heat is excessive, often reaching $110^{\circ} \mathrm{F}$. The inhabitants are composed of varions Arab tribes, and are indolent, treacherons, and cruct. 'They number abont 70,000 .

DA'NNECKER, Joif, Heinr. vox, a German sculptor, was born at Waldenbueh, in the district of Stnttgart, 15th October 1758. His parents were in the humblest circumstances; but through the favour of the Duke of Würtemherg, he received a good oxheation at the Military Academy at Ludwigsburg. His artistic talents were rapidly developed. In 5780, he whtainel the prize for the best model of - Nilo of Urotom destruyed by the Lion;' and in 1753 wont to Paris, where he stndied for two years under Pajon: after which, be proceeded to Finme, where he met with Goethe. Herder, and Canova, to the last of whom he was indelted for much valuable instruction in his professinu. At lame, D. renained till 17!0. Here he executen in marble his statues of "Serres' and ' Facelms.' On his retum to Germany, the Jhke of Wirtunbers appointed him Frofessur of senfoture in the Acadeny at Stuttgart, in which city he residud till his death, Sth beember 1841. I) was undonhterlly $y$ ne of the liest of modernsenlitors. His torte lay in expressing indivinal chavacteristies. in wheh respet he has mot heon surpassed. This fives a groat value to his busts of distinguished persons, such as sichiller, Lavator, Gluck, and the lings Frodurick amd Willian of Wiatembero. Ifis per. coptions of the leantifud and the delieate, especially in the fimale form, are also considered by his comtrymun to be more expuisite and true than those of Camovi himself, lis carlicr works are chietly pasm in thoir suljocts, while his later ones are Christian, and are jervamed hy a ponsive idealism. of the former, besides those ahrady mentioned, the principal are "'iapho.' Lase'. 'l'syehe', and 'Ariadue iss the lirite of Dhaclans riding on a Lemarel fat Framkfurt):' if the latter, 'Clorist,' 'Jolm the l'aptist,' and 'F'aith.'
 one of the stratest prets of all time, aud incompar. ably the greatest among the ltahans, was born in

## DANTE.

Florence in 1205. The ontwand circmostances and fortunes of his life are involval lar the mast part in great uncertainty. His fimmly was by his own account, one of the mast ilhstrious in the city. His father dying while 11. was young, his chatation devolver ugon his mother, bella, In this duty, in Which she displayed great lidelity and julmant, she seoms to have been connsellocl and aidal by the great statesman, sehohar, and pone, Bmote latini. The eloments of kowledte 1). puobahly a a puised in Flownce; in riper years, he sthdial phinsophy at Bologna and Palua. Aitur his boushment, he pursued theology for a time at laris, amb, if Boacacio were to tre bedieved, evon visited Englant. II is studies, however, did not prevent him from discharging the public duties of a citizen. He fourht in the successful battle with the Aretines at Campaldino in 1289, and was present at thr taking of the fortress of Caprona, 1290. What civil oflicess he first hell, we do not know, hat it is eertain that her was sent in several embassies, and at last, in 1:30, rose to the highest dignity of the city, leing chusen one of the Priori fur two months, an office which was the source of his subsequent unbapy fortunes. Florence, on the whole, belonged to the party of the Guelphs (q. v.), but was diviled into the two factions of the Neri and Pianchi (the backs and whites). The Neri were the menmditional adherents of the pope, and this of conurse gave to the other faction a more Ghibelline leaning. Nee Guelfas and Gimbelinies. A tumult in the eity, occasioned by the heads of the ultra Guelphic or black party, caused their temporary expulsion from Florence. They hurried to lime, to lay their complaints before his Indiness. I., who belonged to the Bianchi, was sent liy his party to Fome to counteract their machinations; lint Boniface VIll., in concert with the Neri. got Charles of Valois, brother of Philip IV. of France, to come to Florence and restore peace under the title of pizeemaker. This explains the deaily enmity of 11 . to Boniface. The peace established hy i'harles of Yalois consisted in recalling the banishod laters of the Neri, in giving up the honses ami property of the Bianchi to be plundered, and banishing many of them, and among others Lante. D, never entered his native city again, and his whole sulsequent life was unsettled, spent in various places, and moder varims protectors, at Arezzo, Verma, Puma, \&e. In 1304, the Bianchi made a thal attempit to return to Florence by force of arms, which failed ; am it was probably on this occasion that D. went to Paris. The march of Heury V'll. to Finme in 1810 recalled him to Italy, and he endeavoured, hy addressing ardent letters to the Italian 1 rinces, to promote the cause of the empire. which had now become his own. It was probally with this view and at this time, that his work De Monerchia was written. The unsuccessful sicge of Florence, and the death of the emperor, which followed in 1:313. amihilated the last hopes of $\mathbf{D}$., and he syent the closing years of his life at liavenna, umder the protection of Guido Novello da P'olenta. He went on a mission for this prince to Venice, returned sick, and died on the 14 th September $13: 1$.

As not unfrequently happens with distinguished men, an accidental circumstance in D.'s early youth han made an indelible impression on the sonil of the pret, and, as he himself expresses it, awaked in him a 'new life' At a family festivity, he hat seen Beatrice l'ortinaci, then cight years ok, the daughter of a rich citizen, and the love that sprang np in the heart of the nine years' old hoy became the fountain of the poctical inspiration of his life. How pure, chaste, and teader this love was, is testifiedf ly the Fita Nuova, his iirst work, which appeared abont
1300. It is a collewtion of porms or canzoni, beariner upon this yonthinl low, and alons with each piece is given a listory of its orimin and in minute amalysis. The best whtion if this wollection is that prepremp hy the Marpuis Trivalzin (Mal. 1s27). Batrime married a notaman, Summe de Bardi, and diell youner alout lemo. W. himself aturnards married a lanly named Comma, if the jusworm Ifouse of I monati.
 a vision, in whin the furet is combuctel first by Virgil, the representative of human reasm, thandin
 seatative of seveliation ; and thally ley st lamarel, themp the seseral hearme, whre be boblat the trime (ioul. The name C'ommedict was given to the: work by the peret himsedi- becanse, bergming with the
 style, it is lowly, being writhen in the valgar thene. Ther epithet Dieine was alded lis the almisathon wi after-times. Hell is represconted in tha pem as is funael-shaped hollow, formed of gradually contracting circles, the lowest and marowest of which is at, the earth's centre. Jurgatory is a mountain risios solitary from the ocean on that sine of the earth that is oplosite to as; it is divided into terraces, and its top, is the terrestrial [aralise, the first aloule of man. From this, the juet ascends through the sevea planetary heavens, the heaven of the fixed stars, ind the 'primum mohile', th the emprean, or fixeal seat of God. In all parts of the rewions thus traversed, there arise conversations with moted iersonages, for the most part recently deceased. At one time, the reader is filled with the deapest sorruw at another, with horror and aversion: ar the decenest questions of the theo philosophy and therelogy are discnssed and solved; and the sumal and moral condition of Italy, with the eorruptions of church and state, are depicted with a nobld indisnation.

Fifty-two years after the jout's death, the repuhb of Florence, at the instigation of Loccaceio, sut apart an annal sum for pmblic lectures to expl, in the Dicine connedy to the juople in one of the churehes, and Loceaccio himselt was appointeld first lecturer. The example was imitateal in several other places of Italy. The works of these men aro anome the earliest commentaries on D . that wo possess. The mumber of elitions of the wark amounts hy this time to about Bon. (only a ferw in addition to the commentariss ahow montiment, deserve notice. They are: that printed at Fulimo in 1472-the earlicest of all ; the Nitoleatine edation at Milan ( 1478 ) ; the first Ahtime edition (1502: the first Cruscan edition (16:\%); that of Vollai (1727) ; of Ventur (1732) ; of Lombardi (17:11), ant with alditions and ilhastrations in 1s15, $1 \mathrm{~s}=1$ and 1822; of Dionisi (1705) ; of (50 Fibenlo (Lond. 1842-1843). A reprint of the Fulumg edition aberse mentioned, together with those frinted at Jesi ( 1472 ), at Mantua ( 1472 , and at Xaphes hes Franciseo del Tufuo (ahoat lito arneared at Lamdon, in 15is, mader the smperintembence of Mr I'anizei, and at the expmase of Lorl Virmm.

The Itirinu Conduliog has been translated into almost all Euromean lannayges. Two tramslations of the whole into Latin have bera pinted, one ly Carlo d'hyuino (172s), and lately hy I'meza (1s48). In French, there are a mumer of transations loth in prose anl verse. 'The earliest, ly Grangier, in 15!k, is still the nearest to the original in form, but none is gowe. The Demonn translations are numerons, and such as no other modera language ean "yual in Eaithimuness. Kannegiesser has translated the whole in the measure and rhyme of the orininal (4th etition, Leip. 1843); Prinee John of sixony's tramslation is said ly some to be the best.

The chicf English translatioms are Boylts (1785) and Cary"s (isft), in blank verse: Wright's (1883), in triple rhymes: Cayley's, in the oriminal temary rhyme (the Iatimo, 1851, the Purqutory, 1853, the Piendiso in 1554. with a rolune of ates in 1850): Ir Jonn Carlyle's, the Inferno, in prose, with a judicions commentary (154!) ; Freal. I'ollock's, in llank verse ( 155 ). Desides the Itrime commediu, the lith Suora, and the De Monurchir, 1). wrote me or two other works.
D.ANTON, GeORGes-Thmites, was horn at Arcis-sur-Anhe, 2Stl Octaker $175 \%$ At the onthrak of the French Revolution, he was practising as an alrocate in Paris, lint dill mot enjoy mell repata. tun, on accomnt of his tissolute halits. The fieree half-savage nature of the man, howerer, immeliately fomme a tittings sthere for its action in the chans into which France then fell. Miralwan puickly ictectem his genins, and hastened to attach 1) to himself. l'resilent of the district of the Cordiers, 1 . ruled it at his will. Alone with Marat, and Comille hesmmans, he instituted the 'rmbleliers' ('hbs, an exareerated copy of that of the Jacolins. It sano became the rallying-point of all the hoter rewomtionists. There the tall hrawny man, with harsh and daring comonanee, terrible hack brows, amb a wive of enormons fowe thanderel awanst the aristocrats, till the passions of the $\mathrm{p}^{\text {nil }}$ pulace ruse into magoranalle fury. It was not, how erer, till after the dight of Lomis that the political rible of I . commenced. On the 17th duly $17: 3$, he anel wthers assembled the pemple of faris in the Champhe-Mars, and gonded them on by furions declanation to sign a putition for the deposition of the linc. Some time after, le lecame pro-curcur-sulatitnt for the city of $\mathrm{l}^{\text {and }}$. The comert, which fond that it cond not friuhten I)., now attempted to bribe lim. It is mot certain that he proved venal, lat the evinconce mulnotedy leaves istrong susprim of his venality on the mind. Se that as it may, he som liruke ciff his secret intercrousse with the royalist agents, and beame more the implacable eneny of the momarchy than lofore It was 1). Wlow exeited to action the will sancuinary rabble that, on the Joth of fugust 1792. stormed the Tuileries, and hatchoreal the faithinl swiss The remala of his fatal edmuence was the uthice of Minister of Justice, and here the rimantie parsomality of the mam seemen to wershandow all the surromaing figures. He stom forth as the incarnate spirit of the lievolution, manifostines aliker its heroie ambacity in the presence of lanser from without, and its maniacal terror in the prespone of banger from within. The adrance of the Prossians secmed for a moment to inspire France with is jamie. Cha the oll of september, I) monntal the tribune, and addressed the Legislative Assembly in a spreeh of tremombins power, probally the most allective detiverest during the whale of the lewhations. It clesonl with these words regarting tha anomies of Franoe: "Pour lis vaincre, poir los attermer,
 tomjouss de landace.' France quisured to its core with enthasiam. "In a few werks, fourtern repmb. lican amins staon umon the fich of liatthe amh repriled with mexanpled hatry the agressimes "if the whind fores,' liat mhapuily that "malacity, ly whiwh ahome I) thenght it pusible for Frawe to sive heralf, whined for its perfection the inmoIation of the imprismen pergatists. Oh the very

 - mon ans the Manistire of Instion, hat as the Minister of the liw wolution.' Elected hy the "ity of l'aris one of its derntios tuthe Natmal Cimbention, he resigned his jurlicial function, and zealonaly larriad on the
trial of the king. As a pronf of his ferncions decision of character when pressed ly lifficultics, it is recorked that one of his friende having pintel ont that the Convention could not lemillig try the king, ' Iou are right,' instantly replied Janton. 'Su, we will not try him; we will kill him!" In the mean. time. 1. was sent on a mission to the army of the north, commanded hy Dmourier, with whom he was soon on very close terms of intimacy-tion nucle so, indeen, for the suspicions sond of lis ald iriend Marat. The defection of Dumourier was the si, nall for Marat to give vent to, his snspicions. It therefore became necessary for I). to throw himself again into the van of the rerolutionary movenent. On the 16th March 1793, he established the 'extrarminary crimmal tribunal,' which was at liberty to make what arrests it pleasen, and from whose deadly decisions there was no apreal. Ite also lecame presilent of the Committer of Puldic rafety." U. now set himself to crush the Girondiste, or moderate parts allegins, with singular cambon', that 'in a revolution the authority ought to belong to the greatest scomadrels' In this he was smported by lobiespliere, now gliting into power swiftly and silently like a serpent. - Ifter lee had ellected his purpse, lowercr, a species of remorse seems to have seizer him. He objecter to the institution of the gullotime. This trait of moneration lust lim the favour of the Jacolnins ir Monntain larty, whose nurderons instincts lad them to select liobespieme as a chicf, on the permanence of whose craclty more reliance misht le diacel. Several other indieations of returning humanity lessened bis intluence still more, and at the close of $170 \%, 1$. felt that a crisis was approaching. A fruithess attrmpit was made to reconcile Robespuerre and him. Thoy had an interview, hat parted on worse terms than ever. It was now a struggle for life betwen them; lint I ., sick of the Revolution, and conscions that it was rapidly becoming a shem. (a thing which 1 ., with all his f.unts, could not alride), gave limself up to a sort of reckless apathy, which enabled the sleepless hobosgierre to rumi him. His frients emdeavomed to ronse him. 'I would rather be guillotined than guillutine,' he answerel. Blinded by the conscions. ness of his own inherent pwwer, he also declared that his cnemies 'wond not dare' to lift their finger against him. But men of the stamp of Robespierre -thouch csseutially cowards. and incapable of facing duncer with honest straightforwarilness-have a cortain furtive andicity that cmboldens them to attack a greater than themselves, if circumstances are favomrable. So lohespuerre sprang at $\mathbf{I}$., and so the grat anareh ferishol. On the night of the :0th Harch 1794, he was arresten, and bronght Infore that leerontionary Tribmal which he himsolf had estallishod, summarily combemmod, and, alone with ramille Dexmonlins and others, was
 the fate of Fimhesporre, talling him 'an infomoms 10eltronn,' and immediately anded, "1 was the only prsou whe could have simed him.' 1). was an atherist - mot a calm, thomathend lispassionate disIndieere in the existenco of Giod, hat one who, ly his

 Brtain alnote. Jessides sram and timber, there are sonue miner articles of expert, as latak leet, ammer, spirits, dec. lut lobe the tutal value of the expmenta was $25,64!, 310$ thalers; of the imperts. $29,257.910$ thalers. In that year, 1551 vessels entered the harbomr. The imhabitants of 1), of whon the majority are Protestants, numbered, in $1571,59,121$.

## DAOUDNUGUR-DAREUNG.

DAOUDNUGU'R, a town of Balhar, in the subpresilency of Bengal, stands on the right bank of the sone. D. is ahont 90 miles to the east of Benares, being in lat. $25^{\circ} 3^{\prime} \mathrm{N}$. , and long. $84^{\circ} 27^{\prime} \mathrm{E}$. It is a wretched-looking place, most of its thoroughfares being mere passages. It possesses, however, a considerable trade, manufaeturing coarse falries both of wool and of cotton. Poj. estimated at 10,000.

DAOU'RIA, a country of Asia, partly in the Tussian government of Irkutsk, and partly belonsing to the Chinese territory of Mantchuria Its limits are not exactly defined. The Daomian mountains, offsets of the Salolonoi momntains, traverse it from north-enst to south-west, and separate it from the region of Jake Baikal. The mountains are fertile in minerals.

DAPHNE, a magnificent grove and sanctuary in ancient times, near Antioch (q.v.). The grove was finely laid out in walks of cypress and liny trees, and as the chief resort of all the dissolute persons in the city, Jecame the scene of the greatest debanchery. In the centre, surroumid by the loxuries of nature and art, glorious garicns, fomtains, baths, eolonnades, stool the temple of Apollo and Diana, which was invested with the privileges of an asylum, and became for centuries a 1 lace of leathen pilorimage. The progress of Christianity gradually revived in the Antiochenes the purer instincts of virtue and decormm, and the grove was fimally abandoned. Julian the Apostate, in his vain endearour to resuscitate the lifeless corpse of paganism, visited D., and made the altars of the temple smoke once more with incense; lut on his departure, they were arain neglected, until one night the altars and the statues were discovered to le in flames. They were consumel to ashes; and so perishel for ever the gocis of Inphue.
1). owerl its origin to Selenms Nicator. He planted the grove, built the temple, and gave the place a mythological history in comection with the river Jeneus and the nymph Daphare, who was here tumed into a laurel or bay tree, whence the grove of I. received its name. Nodern travellers are not agreel as to its site. Pococke and lichter recide in favour of Boit-cl-Maa, about tive miles from Antioch; while Forliger and Kinneir consider Babylas the true position.

DAMINEF, a genus of plants of the natural order Themeleacer. havinga 4-cleft, funnel-shaperl jurianth, the throat of which is destitute of seales, right stampas, and a une-secded suculent fruit. All the sfuceins are shmbs or small treps, some having deeiduons, and some lating everoreen leaves, all wif them lussussing in all their parts a more or lows consider. able arinlity, which in sume is so great, that they are even canstic; and the lemries art poisonons, whilst, lownowr, the towers of some are dolicionsly fromant. To this gemes lemonge the Apzemanis (1, v.), woll linown both for the frapmaco of its fiowerg and fur its merlicinal uses, naturalised in somb places of linglamb. 'The (ismont hash (I). (numbinu), a mative of the sonth of Linrops less
 formerios and nass, which is alan in some motasure

D.DRIEN SCHEMEE, THE, one of the most disastrons speculations on recorel, and one which caused an unprecelented uxcitement in scotland from 1095-in which year the I arieu Company was established hy act of the seottish parliancent. sanctimed by royil antlority-till 1701, when the last of the disapminted alventurtns retumed home. The 1). S. was projected by William l'aterson, the founder of the Biank of England. Its object was to plant a colony on the Atlintic side of the Isthmus of

## DARIEN SCHEME.

Panama, and so form a commercial entrepút he tween the eastern and western hemisfheres, An entire mompoly of the trade of Asia, Africa, and America, for a term of thirty-one years, was cranted to the Company. At that time, the foreisn trade of seotland hat heen ruined ley the English navigation ant of 1660 , which provilet that all treule with the Enghish culonies shonk le enodueted in English ships alone, so that when l'aterson encmed his subseription-list, the nobility, the sentry, the merchants, and prople, myal houhs, amd public bolies in senthand all hastenel to subscribe $\pm \pm 0,600$ were immediatrly put down on paper, of
 bucland receivel subscriptions to the amome of
 suribed ex 00,000 . The English parliament, huworer, actuated ly a feeling of mational antipathy, and the jealone clamons of tradime emprations, gave its uneruivocal commomation to the scheme. 'The British resident at 1 lanhurw, probaly with the concurence of the kinf (Willian I11.), also made varions insimuations arainst it. The result of this interference was the almost total withluawal of the Wutch and Euglish sulseriptions. It must now be auntted, even by a seotsman, that there wors one fatal ohjection to the scheme-riz, the danger of settling on fromm clamed by Nown, without coning to a proper understanding with that comonty beforehand. Unable, however, to see any sort if obstacles, incited hy the vehement choquence of ]'aterson, and dazzled by the magnificent proportions of the scheme, the satch hurried forwarl their arrangements. Five ships, with 12010 men on Jonard, set sail from Leith for lamama on the ©ath July 169s. They reached their destination in four months, and having bargained with the natives for a comutry which they called New Cakedonia, the colonists fixed the site of what was to the their capital city, New blinburgh, and built a fort in its vicinity, which they named New St Amirews. Ilaving thas constituted their enlony, they issued a proctamation of perfect freedom of trade, aud universal toleration in rehigions matters
to all who should join them. Aceurdine to the act which established their cumpay, all emends imported loy them, with the exception of forelen sugar and todraceo, were free fron all duties and impusitions for 91 years; and thas, on the whate, they semed for the first few mulhs to ore on the highway to success. Lut the clinate, which was tolerable in winter, became mbarable in smmer, and many sickened umber it; their suphies also faded before they could derive a retmrn from the soil; and on sending to the Lritish culnnies in America for frovisions, they learned with the deefest indignation and despair that the lritislı Aneriean colonies, having leen informed that king William had not civen his sanction to the expelition, had resolved to Inh no intereurse with the new colony at l'anama.
Sickly amd desponding, they waited long for supplies from the mathereountry : but the Company at hone were not aware of their wretched condition, and uone came. At longth, having waitel eicht months for assistance, the colony broke np. In the meantime, 1300 colmists, including 300 Ilighlanders from the estate of loptain ('ampitll of Finab, who had charge of the expentition. had set sail from scotland, Tut ere they arrivel, the pimeers had thed. A spanish foree of 1500 men, and a squadron of 11 ships. immerliately threatened the new-comers. Captain Cumpleth marchet ly night with a body of 200 men upon the sunish camp, which he broke, and completely disursel. (on returning to the fort, howerer, he fomm it invested by the Spanish squadron. The ammuntion of the colonists hat mow become exhaustect, anl they were ohliged to eapitulate, the Spaniards yranting honowahle terms to all except captain Campell, who, however, escaped, and reaching New Tork, obtained a passage to Scotland. The remainder of the colomists, too weak to weigh the anchor of the vessel which was to carry them home, had to le assisted in their departure by the Spaniards. Not more than 30, anong whom was Paterson, who was rendered for a time huntic hy his dreadiful misfortnues, cerer reacheal scotlam. TASHLNAC, a manc derivel from a miveroor of New sontlo Wales, and applied to a dhotriet, a montain-pange, and a river in Australia.-1. A district in Thew sompth Wales. exteuding in S. hat. from 27 to $0^{\circ} 10$, is exclusively pastoral, and has an area if ortowo sy. m. It is traversed by the Condanine, ane of the head-waters of the Murray: Under the designation of Dorens, it contains the

## DARIINGTON-DARTER.

comentes of Aubiquy and Merivale.-2. A mountainramore, about 250 miles long, lying wholly in Wrest Australia. It terminates, in the direction of the sea, at Foint d'Entrecasteaux, pretty nearly the sontl-west extremity of the entire islame. Its culminatiner summit is not less than 3500 feet above the sea-level.-3. The river lorling, in New South Wr ales, aptly characterised as 'mysterious', demanls special attention, not only in itself, but also in connection with some of the most striking peculiarities of the combtry: From the western declivities of the almost continuous ridge that skirts the eastern coast, inummerable torrents pour down into the vast plains, which gratually slope away towarts the interior: The more northerly of those torrents converge in a central 'basin of clay,' on the 30th prallel of S. lat., where, within a comparatively namow space, meet the Naranoa, the Combamiue, the Dimaresine, the Guydir, the Namoi, the Castlereagh, the Macquarie, and the lingan. In this region, the channels undergo many trans. formations, sometimes losing themselves in wille marshes, and sometmes presenting an inextricalile lahyrinth uf lifureations and junctions. After firting with a large poportion of their volume, under the combined influences of evaporation and absorption, the united strums, now listinguished as the D, pursue a jumuey of $G 00$ miles to the Murray, throngh plains which are habitable only on the inmediate verge of the water-course. Throurh this immense reach, the 1 . receives not a single aflluent; may, on the contrary, it sends out many an offect, to bury itself in some stagnant lagoon. It may be alded, that none of the so-called rivers of this region of Australia, with the solitary excention of the Muray itsclf, is really entitled to the name. between lofty banks of bare earth, they exhilit at tinus in immading food, at times a mere series of detached pools of every size and shape.

DA'SLINGTON, or DARNTUN, a burgh in the south of Iorham county, in a rich tract, on a hillshope, on the banks of the Skerne, near its junction with the 'Tees, IS miles sonth of Durham eity. It comsists of a suare market-place, from which hameh several streets ciallent gates. l'ulo m 1501 $2-7: 30$, many lielonging to the sumety of Fricheds. The ehef mandactures are woolden yarns, for imitaturn latian shawls, lirnssels catrets, de, ; Hax, ofotical ylasses. luass and irme wibles. Xiar l). was the suat of (renrge Allan the antignars. St ('utharts, the beantiful parish chureh, was huilt in the lath co, and has three carved stome stalls, aml it
 from D., are emrions eavitics of unknown omigin, -allod JIell Kettles.

DA'RMSTAT'T, a town of Germany, capital uf the wraml-iluchy of JIesse-j armastadt, resideree of the mand inke, and seat of rovermment, is sitnated
 the Naine. It consists of an ohl and new lown, buth of whirl are surronmed hy walls and ditehas. DA'RNEL (Lotium temulentum), a grass of the same genus with the valuable fivegrass (q.v.), an annual, common in corufielels in England and many parts of Lurole. It has no tufts of leaves from the rout, the glumes are as long as the spikelets, or longer, the spikelets contain 5-7 florets which are awned. This grass has from ancient times been reputerl to have a narcotic joisonous sced, to which many bad effects were ascribel, which, in years of had harvest, were observed to cusue 11m the eating of breal or the feeding of horses upon oats. Even Lindley, in his Medical and Peonomicel Betany, pul)lished in 1549, ascribes nareotic and acrid qualities to I). seed, and speaks of fatal conserpences as produced hy it when mixed with flour, saying that it 'is the only authentic instance of unwlolesome "ualitics in the order of the Grasses.' On the wther hand, it is asserted that very recent researches on the continent have completely established the perfect harmlessness of this grass and of its seed; and the effects which have been ascribed to it must therefore be regardind is jroceching from grain injuriously aflected in some way by had weather.

DARNEIAL, a town of Flance, in the department of Seine-Inferieure, about ad

Darncl. miles east of Ronen. It is well built, and has two Gothic churches. Situated at the tops of a narrow valley, and intersected by two streams, D. possesses uunsual facilities for carrying on elnth and other woollen manuactures. Pol. (1572) 5636.
datrnley, Menty Stuat, Lord, husband of Mary Quech of Scots, the ellest son of the Earl of Lomon ly Lady Margaret Donglas, was loru in 154h, in Englani, where also he was elucated. He was haulsome in anpearance, atcomplished in nnamers, but fatally ilestitnte of all moral and intellectual prower. D. is interestiug chiefly on acemut of the , wisition which he ocenpied with respect to his wif: See Stuakt, Mans.

DALTER (Plotus), a genus of bitds very nearly

Warter (I'lulus Anhimys).
allied to Cormorants (if. צ.), but havinit a bill longer than the heal, perfectly straight, slender, and
sharp-pointed; aml alsn ramakable fir tla great lenath of the neck, whicli has oldithed fow them the name of shate-hirds. 'Thry lerime the name I). from darting forwand that lill at than frey by means of their horg thexible: mek. 'They are very voracisus, and eat great quantitios of fish, whiche they swahow entike. 'lhey are finat in wam chmates.

DA'RTEORD (Samon, Jomentiond), a bwan in the noth-west of k ent, 17 miles vast-sonth-cist of London lyy mill, on the left hank of the barent, which is mavigatbe for harpes. It lice in an marrow valley leetween two steep liills, Pop. (1871) Sols. It has large corn-mills, cotton and silk printingworks, large 1 wowler and 1 merer mills ; also mawnface fures of oit, iron, and machinery. Near D. stom the first rolling, slitting, and wire-drawing mill in lingland, as well as the first papermill, hailt by Spielman, who died in 1607. Dhere stand the ruins of a numery, fomeded 1355, by Edward IIl., with 12 acres of walled orchards and gardens. This king held at tommanent hore in 1i331. Wat Tyler's insurrection, in the reign of Richard M., broke out at D. in 13S1. Watling Strect, an ancient Roman road, crossed the river bere. Near D. Ieath are many ancient chalk hollows and pits, with elcep shafts leading to mmerous chmbers and galleries, excavated probably for sepulture, for retreat, or to nake use of the challs.

DA'RTMOOT, a granitic table-land in the sonthwesteru part of the county of Devon, remarkahbe for its wild and ragged scenery, its towering rockcapped hills, the numerous streams that have their source in its boggy soil, and the many cyclopean relics of the aboriginal inhabitants that are scattered over its solitary wastes, where the deep silence is liroken only by the sudden llight of the ring-onzel, the screans of the curlew, or the shrill whistle of the lapwing, dotterel, or stone-plover. D. Proper (or the ancient and royal forest of that name) and its adjuacts, including the outlying commen lands that present the same physical features, extem about 20 miles from east to west, and tex miles from north to south, occupying one-fifth of the entire area of the county of Devon, or more than 130,000 acres. This moorland region, encircled by a natural rampart, moated by deep valleys, has a very considerable elevation above the surrounding country, and culminates in Yes Tor, 2050 feet above the sea-level. Its broken uneven surface has been compared, not imatly, to the long rolling waves of a tempestuous ocean, fixed into solinlity ly some instrutancous and powerful impulse.'

The most important rivers that hise in Northern D. are the Dart, the Teign, the Taw, the West Ockment or Okement, the Lyd, the Tary, and the Walkham: while from the swamps of Southern D. spring the Plym, the lealm, the Erme or Aime, and the Avon, Aven, or Aume.

Geologically, D. is formed, for the most part, of granite rock, which has been protruled through the shales. slates, and sandstones of the Devonian system. Large masses of trap occur at White 'Tor, Cock's Tor, and other localities. 'Tin, copper, and mangancse are Iound amongst the granite, of which Iom varieties-common, finer, red, and compactare distinguished. These, as well as the several kiuds of trap-rock, are monch used for cennomical purposes. At Wheal, Duchy, and Birch Tor are productive tin mines. The soil of D. is composed chietly of peat, which in the bottoms has accumulated in sume places to the depth of 25 feet; it rests on a sulsuil of line sand. Many of the well-watered dells aud ravines are fertile, while the whole moor affords pasturage for cattle, sheep and horses. Amontst the mosses and lichens, with which the region
abound, are the fammon fortlon am the $L$. for-

 the tors of the mons. Wistamis Wowl, as grove of stuoted oak-trex, anmang abont ten foet m height, is of vemeraldin antiquity. It stands an a rokly Weclivity alout 400 yards ia bugth, and measures hess than Io youd acroses the willest part. 'Jhe
 progress of collivation and the peservation of game are driving away the eagle, the lonstand the cram, and the kite, which are now ravely seen. 'The bawlcock is likewise beconing extinct. Hr Hoore salys: The freguenters of the uncultivatod parts are now chiefly the sparrow-hawk, the hobly, the gnshawls, the hen-harrier, the brown or marsh harier, anct the hazzarl.' 'The ontiquities of 1., as illustratin" ancient periorls of British history, iare worth an attentive study; of thesc, the Grey Wethres, belong Sittaford Tor-a fine specinen of what is ustally styled a Druidical circular temple-the vestiges if a large ahoriginal village at Grimspound, the cromlech at Drewsteignton, the logan-stmes and stoneavenues, the kistraens, barrows, cairns, whepillars, and ancient trackways, whose story the ohl turs alone cond tell, are cxamples. Many legends and stories of moorland adrenture are related; Lut the most Lamons is that of the lohd lunter, Childe of Plymstock, whose Iate Carrington has celebraterl in a spirited hallad. See Carrigton's Poems, Mrs Bray's I'amar and T'tay, aml article 'Lost on Dartmoor,' Chambers's Jownal, vol. i. 1. 350.
During the long war with France, couseruent on the great levolution and the carecr of Napoleon, a prison was erected in the contre of the western cmarter of D., at about 1400 Icet alove the sealevel, For the accommolation of prisuners of war. The first stone was laid on the 20th Darch 1806, and the huiding was finished at a cost of ${ }^{2} 127,1000$. 1 rince Town spang ap close ly, aud soon became a thriving place. The prison is now used as a dépot Ior convicts, whe are employed in cultivatiog the adjacent moor.

The castle, manor, and forest of D. were grantel by Neary 112. to his mother Richard, Earl of Comwall; and since 1837 A.D., D. has been promanently annexed to the Duchy of Comwall.

See De la Beche's Jidpurt on the dieuldiny of Cornwull, Deron, and IVest Somerwt (Lowl. 1539) ; and For a full account of D., A Permmbuntion of the Ancient and Roynd Forcet of Dhemenor, \&e., leylies. S. Rowe (Plymonth and Lond. 1s.i6); alsu Pepers on the Gcoloy, Soil. Buteny, wat Omitholony of Dartmow, by Ei. Doore, M.L., de., in aplemlix of the above work.
Indethouthe a parliamentary and municipal bugh and seaport, in the sulth of bevonshire, built in terraces on in steep slope 300 to 400 Teet high, on the right lank of the romantic estuary of the river Dart, at a short distance from the sea. D. is :32 miles south-hy-west of Fxeter. The streets are narrow, ami many of the honses voy uhl, with overhanging stories, frojecting gables, ind wand-carvings. St Saviour's Church, of the 1 th co., has a richly sculptured, paintel, and gilt stome pmlpist. a highly orroamentel interior, and a heantifully carvel mombloft. A battery and the remains of a castle built during the reinu of Hewry VIl., stamd at the entrance to the harfour. Pous (15:1) amso. Many of the inhabitants are uncard in the pitehard amb Lalmalor tisherims. The ehict expurts are woollens, mincr. awd harley. D. is a quarantine prort of the En lish 'hamel, and has a cinsidurable trade with the Nediterranean. In 1860, rutiz vesicls, of 70,965 tous, enterel and

 of the hinhest emancoen, wis bom at Shrewshury,
 W. Darwin, l'.lis.s, and grandson of Erasmus Darwin
( $\mathrm{q}_{\mathrm{F}} \mathrm{r}$ ). Jlis mother was a langhter of . Tosiah Wedgwool, the fanons manufacturer of jottery. After atteuling a public school at Shrewshory for some years, be studied at Edinhmrgh Eniversity for two sessions, and thence proceerled to ('larist 'rillece, Cambridge, where he took his degree of B.A. in 1S31. Jle now vohmateered to go as matnralist in II. II.S. Bente, commanded ly Caphain Fitzroy, R.N., and started for a survey of fouth Americit, and the circumnarigation of the globe, Decembur 27,1831 , retmong to Englame October $2,1530$. IIis ontire life, so far as his health has permittor, has been deroted to scientific researches. D., who is a fellow of the principal scientific socicties, has obtaince the Iioyal Society's medal, aud the Wollaston medal of the Geolorical Society.-. His earliest well-known work, The loyage of ie Netaralist (2d ed. 1845), is a most interesting and heantifully writen work. ln lsan was published his
 Hisfory of the varions (ountries reisited by II.M.s.
 of /I.M.s. Bombe, pmblished by government, to which I. contrilinted the introduction, am? many of the notes; in 1842, The Stmeture and Distrithetion of Coral licif: in 1844, Gifulayieal Ubsernutions on Tolconic Istinels: and in 1546 , his Geulogitet ubserzutions on south Americe. He has also written many pares in the Transactions of the ripological socintl. ln 1851-1553, appeared his valnable Monoproph of the rimpletiat: and in 1859, D."s name became "familiar as a houschold worl' to the mass of edrcated and semi-edneated Englishmen, through the publication of his work, The Origin of siperice bif means of Setural belictione, or "he Preservetion of Furoural Piaces in the strugule of Lifi. In the Origin of Specics, 1. contends that the various species of plants and amimals, instead of being bach speially created and immutable, are continually suflering change through ib process of adaptation, by which those varicties of a species that are in any way better fitted for the conditions of their life survive and multiply at the expense of others. So lutent and miversal does this process of matural selection seem to bre, that $D$. considers it capable, with other less important causes, of explaining how all existinc species may have descended from one or a rery few low forms of life. This theory has excited contruversies which are not yet laid to rest; but it has been emlracell by many of the alhest natumalists, anol has alrealy induced great changes in the methods of hiology aml kimheal seiences. See suerles. D. has since writton, fortilisation of Orehide ( $156^{2}$ ) ; Jetriction of Plents renel inimutls

 sion of the E'motions in Mun emel Aminots (Isias). D. has sulprarted his views with a vast :mmont of :cemate information, amd has invariobly expmessed them with cantion and contesy.

There was much variation in this respuct, not only between one conntry and amother, but aren in the same eomutry as letween one time and another, as well as between its diflerent

## DATE-DATE OF DEED.

provinees at the same time. The new years' days most commonly used were the Nativity or ('hristmas (oth December), the Ciremanision (1st January), the Ammunciation or Lauly Day (2ath Darchi, aud the liesmrection or Easter. The Ist ot . $\quad$ manary was aloped as the commencement of the rear liy France in 1.503, hy Sontland in 1600 , hy Englani in lone. In this list country, the inconrenience of datios by a different year from most of the other great Enropean states harl been si) gencrally felt, tiat for some time liefore the new mode of eomputation was sauctioned by aet of parliament, dates falling letween Ist Jammary aml : 24 th March were commonly expressed in both wase, thus: : Di Felmary 17os, or $1706-7$, the lower on last figure indicating the year accordiag to the present reckoning.

Intherto, we have spoken of dates where both the year and the day of the month are set down in ligures. But in ancient writings, even where the year is expressal in figures, nothing is more common than to indicate the day of the month only by reference to some festival or other peenlirity in the service of the ehmuch. Thus, an Enghish lettor of the lattor part of the loth $c$. is dated in this way: 'Written at l'aston, in haste, the Welnesilay next after Dens pui wroutibus:" that is, the first Werlnesilay after the thirel Sumlay after Easter, on which day that portion of the churcb service which is ealled the intruit legins with the words 7 , hes dui emrantilus. So, again, as late as the rear 1610, the battle of Weissenburg, near I'rague, is deseribed by the contemporary chroniclers as having been fonght'upon the sumlay on which the church sings Peddite quee sumt Cosseris Cisari;' that is, the 2.01 Sumday after Ientecost, which, in the year referred to, fell unon the Sth of November. A still more common way of dating was by reference to a saint's day. Thus, the English parliament which met at Westminster on the 6th October 3399, is described in the contemporary reend as meeting on Dlonday, the Feast of St liath the Virgin;' and the Sonttish parliament which met at Scome on the 3 l December 331 s , as meeting' on the Sunday mext after the feast uf St Amlrew the Apostle.' ln oder, therefore, to inter. pret all this class of dates-ancl it is a very large none-recourse must be had to the calendar and scrvice books of the church, or to the 'glossaries of dates' and 'catalormes of saints' days' which antipurries have compilen from them.
for conturies, it was more common to dato by the year of the king's reigu than hy the vear of our iond. The risk of error in retucing this way of computation to that now in use is such, that in liymer's Fiveru, a great collection of linglish state papers, printal at the mblic appense, in the baginmine of the 1 Sth c ., many documents of all the reigns from Richard 1. to Edward 1V. are misplacel ly a whole year. These mistakes arose chiolly from insullicinent inguiry as to the day from whel, the king dated his reign. This was assumell to lu* from the dily of his predeenssor's death, but in point of faet the early Enelish sovereisns dated their reign only from the day of their eoronation. Where a date, therefure, has to be ascurtained by reference to a requal yar, it beemmes nocessary tomake sure not anly of the time when the king came to the tlurone, lut of the very day from which lue reckoned his reinn. In the case of the pupas of lionne, this inymiry is at once more than usually neeessary, and mare than namlly troublesome, inismmel as, until enmpratively recent times, searenly any two "f thom in immediato suecegsion lated or computed on the samb prindiples. Net a few of them, indeed, :ulnphed liflerent computations at alifferent times of
their reign. Thus, Pius II., during lis pontificate领 six years ( $145-3464$ ), commencel the year sometimes on the 25th December, sounctimes on the 1st Jannary, and sometimes on the 2.5th March. some poles, agaix, datul from the day of their ulection; others, from the day of their consecration or coromation. Nor is it only in interpeting regmal years into mudem chronology that there is a chance vif urror there is proof that oceasionally the regnal years wre wrougty computed at the time, by the kines themselves, or rather by the officers who wrote theor charters. Thus, for example, it has been discovered that from the time that King David Il. of Scotland retmod from captivity in 1357 , the year siven as that of his reign is one year short of the truth. In dealing with regnal years, there is yet another risk of mistake to le guarded against. Until the lGtb c., it was not common for kings to distinguish themselves ly numbers from their predecessors of the same name. In order, therefore, to diseriminate one from another, charters or other deeds of the English Hemries and Edwards, or the scottish Roberts and Jameses, recourse must be had to such tests as the eharacter of the witing, its seal, its style and language, and above all, the names of the persous enumerited in it.

With no other help than is to le gained from such tests, the antiquary is often called on to tix the date of a charter, contamine no reference to the year of our Lord, the year of the king's reign, the year of the pope's pontificate, or any other measure of time. If the persons muntioned in the cleed be men of note, he may be able to ascertain its date to a year, a month, or even a day; on the other hanc, if they are ohseure, be may be unable to relnce the date within in narrower range than 50 or even 100 years.

The skill of the antiquary is not mfequently put to the proof in another way. Dates were often recorded by reference only to an event of the time. Thus, one leaf of the Scottish statute-book contains two aets of parliament, with no more explieit record of their clate than that the one was passed 'at Abrrileen in Lent next after the coming in Scotlane of Tivian the Legate of the Apostolic See;' and that the other was passed at stirling on the Munday next before the feast of st Margaret the Maiden next after the first coronation of lhilip king of the Frencl.' An examination of contemfrimy chronicles fixes the date of the one statute to 1177: wf the other, to 1180.

In order to facilitate the discovery and rectification of dates, varions elaborate works have been mulishal. By far the most important-L' $A$ d de Iérifter les Dutes des fuits IVistoriques, des Chortes, des C"hromigues et autras Monuments-is due chiedy tor the: lanmurs of the Bencrlictines of St Manr. libe best edition of this admirable work is that of Paris, in right folins, the first three containing the priod from the Jirth of Christ till the year 1770 , lown pullished in $1783-1757$; the forurth, eontanings the perimi lufore the birtle of Christ, in 1s: 0 ; and the lat fond, continning the wotk from 1770 downwards, in $1 \times 2-183 \mathrm{~s}$. A proint of this ration, in 42 octawos, mperarol at l'inis in l8151sti. Iff the wher lerench works, it will be enongh to name two - tha Noureva T'uerte de Diplomatigue, also by the Ibumelielimes of st Mur (Par. $7750 \rightarrow$ 176.5, in (if rols. Itor, inal tha Rlements de P'eléo traphip, par Nat. de Wrally (law. 15:3s, in a vols. 4tro). The luest Encrish work is The Chromolomy of Miwtor!, loy the late Sir 11 arris Nicolas, puhlished in lamdner's ('ahimet 'ychonerdict. It has passed thended two editions; the last bears the dato of 153s.

DATE PALAI (Phomis), a gemus of palms, the most important species of which is the common Bate Palm, the Pulm Then of Seripiture ( 1 'h ductulifara), a native of tho northerm half of Africa, the sinith-west of Asia, and some prets of Imilin, an il which has also been loweght into cultivation in the sonth of Eurome, and marht cartanily be introfluced with advantage into the sontl of the Unital States, and many warm fiarts of dinerieat ami Anstralia. The stem, whinh is straingt and simple, reaches a height of $30-60$ feet, and hears al head of 40 So glancons pimated leaves, of s - 10 ficet long. with lanceolate acuminated leands, very ameh chosed upo and a momber of banchiner spatices, bach of which on the female tree bears in sumal 180-800 fruits (lates, dactmi). A bunch of dates weighs $\mathbf{D O}_{0}$ or 0.5 pomets. This is one of the most important and useful of all the pioms, and is indispensalle to millions of the human race, on accomet of the supply of food whieh it affords them. In ligylet and the nther combtries on the north enast of Africa, in Persia, and in Arabia, dates form the principal food, and date palms the principal wealth, of the people. The flesly part of the fruit contans 58 per cent.-of sugar, accompanied by pectin, gum, \&e. The main ingredient, therefore, in a dictetic mint of view, is the sugar. The froit is eaten either fresh or dried, and in the latter state becomes an article of commerce. Cakes of dates pounded and kneaded together, and so solid as to be cut with a hatehet,

Date Pahm.
are the store of food provided for African caravans on their journey through the Snhara. A liquor resembling wine is made from dates ly fermentation, and alsn a kind of vinegar. In Jersia, an ardent spirit is distilled from dates. The soft pith at the summit of the palm stem, along with the youns leaves not yet unfolded, are eaten under the name of palm crabage, and the undeveloped puicles of tlowers also form an article of food to the Persians and Arals. The liquor called palm wine is prepared by fermentation frons the sap of the palm, the top being cut off, and a hollow scooped ont, in which the sap collects. Three or four quarts are olotained daily from a single palm for ten days or a fortnight. The quantity afterwards diminishes, till the tree becomes quite dried up. Many of the inhabitants of North Africa use the roasted date stones or seeds as a substitute for coffee, for which purpose the seeds of the Phonit reclinata are also employed in the south of

Africa. "the soeds or stomes of dates are in many phaers grmmal for the sake of the oil which is after. wards eltained from them ty expression, aml the ranaininer paste of wake is given is fome to cattle. From leaistalkes uf the comonen 1). P., atl kiurls of lasket and wickn wonk are alsh, mad, and walkingstivks, fims, \&e.  this sjucies, that it is chonhtul if it is disthent. In some places, the treses present a curimely distorten and zimatren amane from the pratice of yarly tapping the altmate sidus for the sap or tombly. The incision is just helow the crown, and slanes uncuards and inwaris; a vessed is hong bohow the wound, and the juice conducted into it liy a little piece of bambor. It forms a gratoful anid wholeshme heverare; radily also fenmenting into falm win', and by distillation yidding inrack (q. v.); whilet if boiled down without heing allowed to ferment, it gields the saccharine sirmp called juthery, from fuir pomeds of which one found of sugar is obtained, a single tree promucing about seven or ripht pomms of surar ammally: The operation of tafupine fore tondy spoils the fruit of the tree, which is small and mucb inferior to the African date. It is, hrwew. eaten--Another species, Ph. palutose, the most grecrarions of Indian falms, growing only six of eight feet high, eovers the vhole laniscape of the Sunderbunds with the liveliest verdure. Ph. amulis, Ph. farinifera, and $P$.spinosa, are three ather elosely allied specics; the first grows in the driest suils in the damp valleys of the ITimalaya to $5 \% 110$ feet atove the sea. All three are dwarf species.

DATE PLUAL (Diospyros), a genuts of plants of the natural onder L'benacee, cousisting of decilumas trees, whose Iruit is a globose berry, natives of warm or temprate climates. The black hartwood of some species is Erosy (q. o.), and the ham timber of athers is linown as 1rowwour. sume are valned for their fruit. The Commos Date Pbom, or Pisimmis, also called the Etrofens Lottes amd the Dure of Trebisond ( $D$. Lotus), is a tree of 20)- 40 feet in height, with oblong shining leaves and small reddish white llowers, a native of the consts of the Caspian Sea, Mauritania, for, lout eultivated and naturalised in the sonth if Durnpe. Its frut is of the size of a cherry, and in favourable climates larger, yellow, sweet, and astringent. It is caten when orerrip, like the medlar, or is usent for conserves. The tree hears fruit abmondantly in the neighbourhood of London, but is some:what tender in the climate of Dritain, and its fruit more anstere than in mone southern reimens. This fruit bass leen supposed be some to be the Lovers (q. v.) of the Zotophasi. The Vibginhay Mate Plem, or Preshos ( $D$. Jirpinianes), is a tree of $30-60$ fect high, with ovate oblong leaves and paleyellow flowers, a native of the sonthern states if North America, where no tree often yichds sceveral bushels of fruit. The fruit is about the size of a bullace, reddish, with six to eight uval seeds. It is not palatable till mellowed ly' frost, and is sweet and astringent. A kimd of beer or ciker and an arment spinit are male from it.-The Mabole (D). Nakola) is cultivated as a fruit-tree in the Iste of France. Its fruit is about the size of a quince, and has a very agreeable tlavour.-The Faki (D. Kaloi), sometimes called the Keg-Fig, is a Japanese tree, sonetimes kept in green-houses in France and England. The sweetweat called Figues. coulues is made from this fruit in France. The fruit resembles a plum. It is occasionally brought

## DATHOLITE-DAUN.

from China as a dried sweetmeat.-The fruit of some other species of Dioxpmos is also edilite, as that of I). decambre, a large velow liers, which. notwithstanding a lisagreable smed, is sohd in the makets uf Cuohim-C'hima.

DATHOLITE, a mineral of a eqayish or qumbish White colour, occurring buth massibe and crystallised in thombic luisms, the colges and angles of wheh are ent otf l,y planes. It is componed of loracic atild, silica, and lime, with a little water. It has ¡een fomm both in gneiss and in trap luck. The Salishury Crags and Corstorphine JIill, near Lilinbursh, are localities for dathalite.

D ATISC'A'CEA a small natural mider of plats, allited to Begonimece, and ennsistimis of hawhs and tiecs, chiety natives of the termperate parts of the
 much resembling lemp in its gencral apporance, a native of Crete, possesses very marked tumic properties. It contaims also an molaceons substince, called Dutiscin, resemblins inulim. It aftords a Selluw dye.

DA'VID (lleh. "Belosed"), kince of 1smad, the ninth and yommest son of Jesse. Intonmed to the trile of Julah, amd was probably eqlacitom in "ne of the sehomls of the prophets. He first Inlilicly signalised himself ly slaying Coliath of fiath, ib ghrantic Jlalistine who hat dufied the anmes
 deralle reputation as as skiffal harper, ant lam suln bed by his musie the paroxysms of incoaity which allicted šan! at cortam seasuns. lig manuel he was anomed king luring the lifetime of sad, Who soon leman to regard hime as iv danererons cnemy, aml brsecuted lim. A lime of intermittent war between the two wins the consequence, in which D. Was often reduced to errat straits. At lirst, lie was simply in the pmition of a gucrillia chice amd his commales wore manly persuns in lesperate ciremmstances-'all who were in distress, in ilelit, in liscontentenl.' Latterls. Le lived among the lhilistines as ont of themselves, and from the lhilistine prince of "ath nbtamerl a present of the strons fortress of Ziklag, after which he was juine hy a class very different from his original untlaws-men of consideration, and tried warrions, from various tribes. The contest between him and Sabl now assumed the dignity of a civil

## DAVID

war. It was unly elosel by the death of the latter, whereupn 1b ascended the threne of Jutah, with the eity of Hebron as his capital. The other tribes elected 1shbosheth, a son of Sanl, to be their king, after whose murder D. first aequired 1 nossession of the entre kinglom, over which he ruled from 1055 until his death in $1015 \mathrm{~B} . \mathrm{e}$. H is first monertaking in his new oftice was a war against the Jelmsites. He tork their chief city, Jerusalem, and made it lis resilence, as also the centre of the religions Worshin of the Hebrews. Subsecmently, he sulinuated the Philistines, Amalckites, Elomites, Moabites, Ammonites, and, after a long war, the Syriaus. His kinglom now stretched from the Eupluates to the Mediterranean, and froms Syria to the Lot sea, and contained a population of $\overline{5}, 100,060$. 110 fusteren mavigation and trade, especially with Tyre, and sought to instruet the Ilelirews in the arts. No less eareful was he of the religion of his countrymen. He diviled the priests and Levites into classes, and appointen saered singers aml poets for the musical service of Ciod. Law and justice likewise receisel improvements at his hands, through the institution of higher and lower judiciary courts, while he sectrel the stahility of his power by the formatiou if a stauling army. Desides this, there were twelve fovernors over the triles of Tsrael, 'who may ferbaps he compared to the lord-lientenants of Enclish eounties.' U. was not, howerer, withont his trials. Two conspracies were formed against him in his own family, and although both failed, they greatly imbittered his life. His sensual excesses also drope him into aets of criminality, the memory of which hamted him for ever. "My $\sin$ is continually before me.' Yet we cannot helj, reengnising in the wan, in spite of all his errors and sins, a sincerity of moral feding rarely equalled in history. His passions might lead him astray, but they nerer blindel his conscience. The erime once committed, $I$. never tried to find exenses for it, and so hhme the date of his deserved misery. The pisalns which he has left reveal to us the maked soul of the royal poct wrestling with a host of black tronbles, fears, am donbts, out of which, howerer, as from the seething lonom of chaos, there encrges at last a 'full-onturd faith,' made perfect by sulfering and muls triloulation. There has never buen trist in (roml more clear, nowaverind, and tender than that exuressed in the pal I'salm. It is this many-sided experience of hife that has male the ' l'salims of Darid' (thomath it is ancertain who made the collection, which contains many not written ly favil himself) the most precions leritave of the afflicted and tried in all ares of the Christian Church.-By thuse theologians who look upon Jewish history as having a topical or alloporical meaning as well as a literal noe, It. is regarded ats a type of Christ.

DAVID I. (uften ealled Sp DAvtip), king of Scotland, was the yomesest of the six sons of King Daleolm 'eammer, liy his second wife, the AngloSaxon prineress, st Margaret (1. v.). He was born ahont the year 10 So. Buring the fieree struygle for the Sentish orown, which followed the death of his father in 1093 , the youthful 13. seems to lave found refure in Enchund, alons with his sister, Eadryth (11) Matalala, who, in 1000 , married Howry l., king of Englami. 'Ther resilenco of I). at the court of this arconphished monarch would appear to have bern fromond for several years, and the assertion
 "reditur, that "it froml him from the rust of Scottish larbarity.'

In 1/it, his rhar hrother, Alexander, sumeemed to the throme ant 1). larame J'rince of cmoria, a territory which comprised what are now the 430
shires of Cumberland, Dumfries, Roxburgh, Selkirk, Peebles, Lanark, Ibmbarton, Lienfrew, and Ayr, and was hoh of the Engtish king by the heir of the king of the seots. Along with this ereat princt inlity, he seems to have held linds in Luthian ; and hy his marriage in 1110 with Natilda, wilow of the Earl of Northampton, he actuirel possession of that earklom, together with in claim to the rest of the vast demains of her father, Walthenf, Earl of lluntinerdon, of Northampton, and of Northumberland. The first act of D., as I'rince of C'mubria. was to restore the fallen bishopric of Glasgow, which he committed to the charge of his old precuptor, John. His next act was to bring a colony of Lendictine monks from the newly fommet monastery of Tiren, in France, and to plant them beside his forest castle of selkirk. This was in 1113; and even thas carly, as his charters shew, he hal gatherel round him the Bruces, the Lindsays, the Dorvilles, the Umiravilles, the Percies, the tivdels, and ather Anglo-Norman kuights, through whose hely, he was to ellect such a momentous change in ricotlancl.
In 1124, hee sucicelted to the Scettish throne, on the deatly of his brother, King Alexauder I. That prince hat had to fight for lis crom against the heirs of the ofd Celtic dynasties, supported by the wild tribes of the north and the west. They renewed the strughle with his suecesser, first in 1130, when they alvancel almast to the gates of Hechin: aml again about twenty years later, when they appear to hare been enceuntered on the plains of Jurray. On both oceasions, the Anglo-Norman chivalry with which D. hal garrisoned the smithern provinces, gave him decisive, but far from casy vietories. He was less fortunate in his wars leyond the Tweed. In 1127, he had sworn, along with the other great barons of Euglanl, to maintain the right of his niece. Matilda, as heir of the English rown, shonld her father, Henry I., die withont male issue of his own hady. The event thas contemplatal came to pass in 1135; and when Stephen mounted the English throne, D. took arms in hehalf of Matiala, and subdued almost all the country to the south of Durham. Peace was restored ly the grant of the earliom of Ifuntinglon, and the promise of the earkom of Northumberland, to D.'s son llemy, then in lis goth year. But the war was soon resumed; and in 1138, the king of Seets, deserted by Lruce and others of his Anglo-Norman vassals, was signally defeated in the Battle of the Standard,' near Northallerton. The next year, a second peace was condukal between the two lings, when the promised earlhom of Northmberland was lestowel on D.'s son Henry, In 1141, the Scottish king marched into England for the third time to assert the rights of Matilla. He was a thind time defeated, and only regained his own country with dithicolty.

The rest of his reign was ilevoterl to the accom. plishment of the grat rewolution which had been hegrur lyy his father, king Makeolm, and his mother, St Margarot, amd contimoed ly lis lirothers, King Elgar and King Alexamler-the estallishment in Seotland of the civilisation which olitained in England. Ify huiking castles, he secured the peace and saffety of the combtry; hy arecting burghe he promoted its trade, shimping, and manfactures, and faid the fom lations of its frechom; by cndowing hishapries and monastorics, lie proviled homes for 1he waly mon of haruins aml anlightemment known in his thne. His descrmbunt, King Janes I., standins ly lis tomb in bunfermline, is said to have complaimel that "he was ane sure sanct for the crown;' but the remark, if it was mer made, would only shew that the sloth and ignorance of the elergy

## DAVID.

in the f5th e. had blottorl out the remembrance of die grent services which they rembered to mankime? in the foth c., when thoy were the schoolmasters, the statesmen, the lawyors, the physieians, the frmkors, the enginecrs, the artists, tho lmiklews, the" glasiens, the agriculturists, and the gamberes of the age. One who was a lard julef of momarehs-tha groat scholar, linchanam-sial with much mon" tereth, 'that if men were to set themselves lo draw the image of a grame kinge they womld fall short of what lonvid sheworl himself thoughout the whole course of his life,"

Kiner 1). died at ("arlisho on the -Ith May llan. llis som tlenry had lied in the previons dune, amd he was sucecerded by his gramdsom, Nalcolm, then iu his twelfth year. The ohlast scottish painting now known to exist-an illammated charter to the monks of $k$ liso, written in 1150 -preserves rule miniatmos of the young kind and his saintly grandfather. It is engraved in facsimile in the liber $s$. Marie de Culchon, presentel to the lian. natyne Club lyy the Duke of lioxburglse in IS .16 . sume pleasing traits of tiong I.'s personal character -which seems to have been in many ways trmly admirable-are freserved in the E'ulogium Davidis Retis Scotorum, by his friend St Ailrel, ablunt of lievaux, printed in linkerton's l'ila Autipuen Sanctorum S'cotice (Lomd. [TS?). Other instrmetive materials for the king's life are supplied by the same writer in his tract De brhlo Stomulurdi, printocl (together with other contemporary acoonnts of the loattle) in Twysden's IIistorice Andicamed sicriplores Decem (Lont. 1652) ; and by doceline of Furnes in his Fiter $S$. Wathew (ablsot of Melrose, and IT:'s stepson), fuinted by the liollandists in the dme Sanctorm, and in a less Inrfect state in Fordm's Scotichronicon. The remains uf [I's lugislation, including the interesting eode of the $L$ egrs like gorun, lave leen earefully collectel in the thrst volume of The Acts of the Porliamuts of scolland (Ealin. 184).

King $D$. is often ealled St Davii. The was never formally canonised, or places in the foll of saints of the Coman Catholic Chureh: lnt his name was inserted in the calendar preficel to kiner Charlus's Prayer-bouk for Scotland, printed at Edinlow in $160 \%$.

## Divid II. See Bruce.

DAVID, Félicien, a French eomposer, was liom Sth Mareh 1810, at Codenet, in the department of Vaucluse. He was at tirst a chorister in the eathedral of lix, and at the age of twenty entered the Paris Conservatoire. IIe threw bimseli earnestly into the social specnlations of his day; becme an ardent disciple of St Simon, ant afterwarls of Enfantin; and finally, on the lmeak-up of the brotherhood attempere at Mcinimontant in $18.3 n$, he betouk himself, along with cleven of his fellow dreamers, to the East, there to realise his thenry of life in undisturbed pence. The little knot of enthusiasts reached Constartingule, whence they matle their way to Smyrna and Cairs. As they land no means, they sutfered greatly from wont. sicleness, sund ill-usige. The planae forced them to the from Figy口t, throngl the desert, to the coasts of syria. It is said that they drageged a piano with them over the sames, and often, when they rested on their tollsome march among the will tribes of the widlermess, D., whose ear was quick to catel the native airs of the Last, sent forth enchanting strains from the instrmment, and made fis comyates forget their misfortuncs. In $18: 35$, he renched Frince, amd published his Mélodies Orientales for the piamoforte. They were unsuccessful ; and 1). remained in obscurity till 1544 , when he brought
out at the (Gonservatoire lis Désert, a granl Oele stomphonier as tre callod it, the worls of which were fumislad hy las frimal aml fellow-wamlerer,
 complete. D. Wits deelarial a mastor at noce, ambl

After the hattle of Waterloo, he received the command of the relies of the French arms undor the walls of laris. Ile wouk have continned the
contest, had he not been ordered by the Prorisional Govermment in the capital to conclude a military convention with the allies. In 1819, he was made a peer of France. His death took place June 1, 1823. Firmness of character and dauntless courage were D.'s leading eharacteristics; but his military sererities often went the length of harshuess, and even cruelty, while his rapracity had in it something akin to barbarism.
DAVY, $S_{\text {IR }}$ Hompiny, one of the greatest chemists of his own or of any age, was born on the 17 th December 1738, at Penzance, in Cornrall, where his father was a carver in wool. At the school of Truro, where he was educated until he was 15, he shewed little relish for classical learning, but he was distinguished for a highly retentire memory and an early passion for poetry, which never forsook him. Another prominent trait of his character was equally early dereloped: as a child, he would angle even in the gutters of the streets; and only two years before his death, and after his health hal given way, he published his interesting volume, S'almomia, or Days of Fly-fishing. Suon after leaving school, he became apprentice to a surgeon and apothecary in Penzance. lle at the same time entered upon a course of study all lut universad. 'Speculations on religion and polities, on metaphysies and morals, are placed in his notebooks in juxtaposition with stanzas of poctry and fragneents of romance.' A system of mathenatical stuily, seeptical philosophy, Scotch metaphysies and German trauscendentalism, successively engaged his attention. The study of natural philosophy brought him nearer to that department which was to be his own; but it was not till he had reached his 19th year, that he entered serionsly upon the study of chemistry. He now made the acquantance of 1or Pedures, who had established a l'wematic Institution at Clifton, and who tock him as his assistant. Here D. carried on a course of experiments on the respiration of dilferent gases, in which he had mure than once mearly sacritiond his life. He thus discovered the singdar exhilarating effect of nitrous "xide when ineathed. The aeconnt which he pmblished of his rescarches, established his reputation, and led to his appointment, at the age of 2.2 as lecturer to the lioyal listitution of London. Ine delivered his first lecture in 1 sitl ; and his doquence. and the nurelty and varicty of his experiments, sumat at racted erowded and brilliant audiences. lin 1503 , he lexan researches dometed with agriculture, wh which he delivered a comase of lectures. These were pulhished in 181:3, whur the title of Elenents of Ayricultural (hemistry, and form an era in that science. The discoveries, howewer, on which D.'s fame as a chemist elhefly rusts, tuol' their origin in the views which he develoged in 1806, in his Bakerian lecture, On some Chemical Agencics of Electricity. This essay was universally revarled as one of the wost valuable contributions ever made to chenical science, and whtined the prize of the French Institnte. Following out his primeiphe, he was ked to the graml discovery, that the alkalies and earth are compound sub). stances formed by oxysen united with motallic hases. It was puitash that he first suceceded in decompesibeg, on the sth Uetobur 1807 . When he first siaw the ghobles of the new metal, pofassizm, his chelight is saill to have lrecon socestatic that it requiral some time for him to compase himself to continne: the "x\}"riment. He next decomjused sula and the alhalime carths, haryta, strontia, lime. and mannesia; and discovered the mow metahs,
 With regard to the earths proper, he sucecedal in proving that they consist of bases united to oxygen.

It was reserved for Wölder and uthers to exhibit the bases by themselves.

In 1512, D. was knighted, marriei a lady of eonsiderable wealth, and resioncel the chemical chair of the Royal Institution. That he might iurestigate his new theory of roleanic action ho reccived permission from the Freuch government though the two eountries were then at war-to visit the continent, and was reeeived with the greatest distinction by the scientific mon of France. On returning to England in 1815, he entered on the investigation of the nature of fire-damp, which is the cause of explosions in eoal-mines. This resulted in the invention of the safety-lamp ( $\mathrm{q}, \mathrm{v}$ ) -one of the most valuable presents ever made hy seience to humanity. Thongh the value of the invention was everywhere acknowledged, the only national reward was a baronetcy after a lapse of three years. This has been contrasted with the pension of $£ 1200$ a year bestuwed by the same goverument on Sir William Congreve for the invention of his rocket. On the death of Sir Joseph Banks, in 15:0, Sir Humphry D. was elected Iresident of the Loyal Suciety. His attention was shortly after called to the important object of preserving the copuer-sheathing of vessels from corrosion by the action of sea-water. This ho effected by altering the elcetric condition of the copper by means of bands of zine; but the bottoms of the ressels became so foul from the adhesion of weeds, shells, de., that the plan had to be abandoned.
Early in 1525, Sir Humpliry D. had hegun to complain of the loss of strength, and, in 1826, he hat a paralytic attack affecting his right side. He malle two journeys to the continent fur the recovery of his health, and dimat Genera on the 20th May 1829, at the early age of 51. The fonevese government evinced their resject by a public funcral. So wictely spread was the reputation of Sir Humphry D., that he wis a number of almost all the scientitic institutions in the world. Cuvier, in his Eloge, says: 'Mr Dary, not yet 3 y years of age, oceupied, in the opinion of all that condil juice of such labours, the tirst rank anons the chemists of this or of any other are.' Besides the works alrcady mentioned, and a neat number of contributions to the Philosophical Transactions, Su' llumphry 1). publisheel Elemonts ('hemical I'hilosmp!y (Lond. 1s12); and Consolafions in Trupt, on the Last Ithys of a Philosomher (3it ch. Lome. 1831), appared after his death. See Menvirs of the Life of sir Humphry D., by his lrother (Lond. 1s:3b, 2 vols.) ; and The Life of sir IIumpher, D., hey Dr Paris (Lond. 1831).

not immediatcly nemb, are carried in tin-lowes or wicker-baskets called pethoteke, by separate bearers, who precede or accompany the palanquin: whatever he consulers necessary, however, he kerps beside himself insile. At all the stices, which are from 9 to 11 miles apart, there ane relays of bearess, previnusly provideal by the pmethateser, the usual number for one palanguin hime obeven. All arrangements as to most are mando with the postmaster of cach presilency buthre starting, but the traveller is also expected to pive sume small sum to his bearers at the ent of eately stage: cight amma (one shillinds) among the entire set of bearers is as much as is expucted in the way of erratuity. The Ilorsediawk, a kind of carriage with seats for four, and capable of being used ats a bed in which two can slecp, the bargena being conveyed on the top, set on wheels, and drawn by horses, is in use on the great trum toad from Cablentia to the upper provinces, but has nut been established threughout the comery generally.

DAW'LISII, a flumishing and picturesque watiring-place, on the south const of Jevonshire, 12 miled sonth of Exeter. It lies in a valley ruming enst aml west between the months of the Exe and 'luign. It has recently built public-baths. I'op. (1861) 4014.

## DAWN. See Twilight.

DAX, a town of France, in the department of Lamles, pleasantly situated on the left bank of the Adour, 20 miles north-east of Biyonne. Among its principal buildings are the ligh chureh, once a cathedral, and the bishop's palace. It is an intermedlate depott for goods forwarded to Spain, and has some manufactmes of earthen-ware, wine, and braudy; but it is chielly remarkable for its hot saline springs, the temperature of which at the souree is $212^{\circ} \mathrm{F}$. The water, which is medicinal aud nearly tasteless, was nsed for hathing-mupuses by the Romans, who ennferred upon the springs the nane Aqne Augustre Tarbellice: [op, 5001.

DAY (probably allied to the Lat. dies day, divem, the sky, from the roat dir, to shine) (rigin. ally meant the space of time during whieh it is light, in opposition to the space of larkness or night; it now more usially lenotes a complete alternation of light and darkness. It is the carth's rotation that causes the vicissitule of day and night. The earth being a globe, only one-falf of it can he in the snn's light at once; to that half it is day, while the other half is in its own shadow, or in night. But ly the earth's rotation, the several portions of the surface have cach their turn of light and of darkness. 'I'his harpens beeanse the position of the earth is such that the equator is on the whole presented towarls the sun: han cither pride been towards the sun, that hemisphere womblave revolved in contimal light, the other in contimal darkness.

One complete rotation of the carth does not marke a day, in the usual sense. If the time is noted when a particular fixed star is exactly sonth or on the meridian, when the same star comes again to the meridian the next day, the earth has made exactly one rotation, and the time that has clapsed is called a sidereal day. This portion of time is always of the same length; for the mation of the earth on its axis is strictly uniform, and is, in fact, the whly strictly nuiform motion that nature liresents ns with. Sidcreal time or star-tine, from its uncarying uniformity, is moch usel by astronomers. But the passage of a star across the meridian is not a conspienus cnongh event for regulating the movements of men in general. It is not a conplete rotation of the carth, bnt a complete alternation of light and
darkuess that ronstitudes their day. 'Wise whinh is cillent the cetel or the soler day, is nuwasure 1 latween two merdian passages of the sum, and is ahout four mimutes lonener than the sidereal day. The canse of the greatur honeth is this: When the racth has mate one momplete turn, se as to hrine the moridim of the place to the sane porition anome the fixed atars ats when it was nom the day lafore, the sun hat in the metutime (apparently) moved "astward menly on" degree amone the stars, and it takes the earth alout four minutes more to 1 nove round so ats to owertake linn. If this eastwat motion of the sun wore numorm, the lunsth of the solar day would be as simple and as casily duteminmins that of the sidereal. lint the edjpitic ar sun's prah erosses the carth's anator, aml is thandore mome oldiane the the dirnctinn of the cartlis rotation at one time that amothor ; and besides, as the carth muves in hor orbit with sarying spech, the rate of the sun's apmarent motion in the ecliptic, which is cansed by that of the carth, minst also sary. The ennsequence is, that the length of the solar day is constantly fluctuating; and to get a fixed measure of sular time astronomers have to imarge a sun moviag uniformly in the eqlestial equator, and completing its circuit in the same time as the real sun. The tome marked by this inaminary sun is callesl menn soler time; when the imaninary sum is no the moridian, it is mom moon: when the real sam is whemeridim, it is apyorent nom. It is onvious that a sun-dial must shew apparent time, while clocks anal watches kerp mean time. Only in four diags of the year do these two kinds of time erincide. In the intervals, the sum is always cither ton fast or too slow; and the difference is called the equmtion of time, because, when abled to or subtracted from aplarent time, it makes it equal to mean thene. The mean colar day is divided into twenty-fuur hours, the hours into minutes and secomds. A sindereal day, we have secu, is shortor: its exuet lemath is $2: 3$ hours, 56 minutes, 4 secombs of moth shlar ur eommon time. Astronmers divile the sibereal lay also into twenty-fomr hours, which are of comrse shorter than common hones. In the eonrse of a civil year of 36.5 days, the earth turns on its axis 366 times, we there are 306 sideneal daya. D-trmo mers reckn the day as hegiming at mom, and come the hours from 1 to 24 . The civil hay lugens at milnight, ami the homs are connted in two divisions uf twelve each. The ecclesiastical day was rcckonel? from sunset to sunset.
it duy, in lue, inchules the white twents-fon hours, without any reference tis the seas, of of the year, or the amount of lizht or dambess. Whore there is no quahfying stipulation, thorefore, the obligation to pay on a cortain day is discharged, if the money lie paid lefore twelve coluck at night, or the commencement of the following day. On the same principe if anything is to loe fune within a certain time from or after the ding of a certain other thing, the day on which the first act or necmernee takes place is exchuted. It A linels himselt to bay marmey ten days after L"s death, amd I: dies on the 1st, the muncy will not he dae till the night of the llth at twelve nelock. Where it is mot absolntely necessary, for the purpuses of justice, the law excluntes fractional portions of tinue: thus, half a year consists of 1 l 2 days, and a 4 narter of a year of :1.

A luafuh thay is a day on which there is no leaal impediment to the execution of a writ-i. e., all days exeept sumdays and fast-lays almmond lay gevernment. Criminal warrants are an exceptan to this rule, and may he loth granted and executed on Smulays and fast-lays. By 2! Car. 11. e. 7, all contracts made by persons in their ordinary calling
un a sunday are rind. The exceptions to this rule will be expainel under Sabrath UBSERVANCE. In England, C'laristmas-day, Good-Friday, and Easterday, renerally, stand on the same fonting with days aprouinted by royal proclamation for public fasting and humiliation; lent in Sootland, there is no exception made in fivour of any of the feast or fast days of the chureh.

Days of crace The time at which a lill is actually due. or at maturify, is in gencen thrue days aiter the time expressed on the face of it. The three additional days which are generally allowed hy the enstom of merchants, and which the laws of the United Lingdom reeognise and protect, are ealled days of grace. If the third day of arace fall on a Smblay, on on a day of public fiast w thanksgiving, or, in Enclind, in Christmas-dily or (inolEruby, the bill is che the day before bee limb.

DAY, Thomas, a political writer and poet, was born in Tambon, June 22, 154s, and stmited at Oxford. The American war of imlepentence, with which le strongly sympathised, seems to have roused his poetical energius. $\ln 1783$, he published The Duing Segro: in 1776, The Deroted Legions: and in 17ニ. The Desolution of America. But lue is chiely remarkable as the author of the famons Mistory of situlford end Mrotom, as also the Mistory of Little Juch: He was killed ly beinerg thown from it horse, 2sth September 17S9.

DAYAKS. See Donver, amt Dincomb, SH JんMEs.

## DAY-FLY. See EpImMerd.

DiY-LILI (Hemrromblis), re remus of plants of the natural orler Liticece, havins a perinntle witle bell-shaped limb, and snlo-eylindrical tube, and glolnse sueds with suEt tesu. Several spectes are enlivated in our flower-ondens, especially the fragrant Vullow Day-lily (II. Nuera), is native uf

ares, when the word Dity was specially applied to the day aplointed for licaring a cause, or for the mecting of an assembly. A daysman was thus a judre alpointed to decide between pratios at a juhtial hearing. The word occurs in Soriptnre, where Jol, sorrowfully sitys, in reference to his relation to God: "Neither is there any" dinysman betwixt us, that might lay his hand apon us both' (Job is. 3B).

DAY'TON, the fonth city of Ohio in the Unital States with regard to prpulation and wealth, stands at the fondluence of the Miami and the Nak in lat. $89^{\circ} 44^{\prime} \mathrm{N}$., and long. $\mathrm{S} 4^{\circ} 11^{\prime}$ WV. It is connceted with ('incimati, the eommercial capital of the state, on the Ohio, by the Miamj Canal-the distance leing 5? miles; and it is the terminus of six railways, which raliate in every direction. In the variety aurl extent of its manufactures, D . stands furemost among western towns in proportion to its size. The population has rery rapilly increased. In 1550 , it amounted to 10,976 , having almost quadrupled within the preceding a gears; in 1533 , it had risen to 16,562 , shewing an adition of more than 50 per cent. in three yenrs; while at the census of lsom it amomed to $20,45^{\circ}$.

D'AZA'RA, Dos Felis. a very eminent naturalist, was boun at 1erbmales, in Aragon, 1Sth May. 17410 was alucated at the unversity of Huesca, obtained a commission in the Spanish army, was severely wourded in the attack npon Agriers, and in 1781 was apprinted one of the commissioners for fixing the bonndaries of the Spanish and Purtuguese possessions in Sonth America. ITe proceeded immediately to that comntry, and did not return to Spain till 180], eneomtering many ditioulties in the discharge of his duties, in which he shewed the grenterst faithfulness and perseverance. He deroted bimself also to the investigation of the geography, ethonolest, and matural history of the regions in which he spent so many vears, and published an account of his tracels, and an important work on puadiupels and limes, muder the modest title of - Fotes on the Suturvl History of Paraguay and Luth Phete ( 11 atrid, 1802 , et eqg.).-D.'s ebler borother was eminent as a kliphnatist.

DEACON OF A THAINA, the president, for the time beine, uf eertain ineorprations in Seotlamd; in whish cosintry, before the passing of the burgh lifom Act (3 and 4 Will. 1V. c. 76), the dewons of trintes ur cafts representul the trades in the ausuection town-commeils. I'hey were elected ly

DEA'D-FREIGHT, the compensation paid hy the werchant who freights a whole ship to the shipmaster for the space which he fails to occupy. It is rather a clam fur damares for the loss of freight, than freight itself, and consequently, apart from positive stipulation, the shipmaster has no lieu for deal-freight over the goods on luard. His clam must, consequently, he made cffectnal by a persunal action against the freighter.
DEAD NETTLF (Lamiom), a senus of plants of the intural noder Colfiuter, having a 5 -toatherl calyx and a $\because$-lipped corolla, the uprer lip arched, the lower lip trifid. The name D. N.-pupularly in some parts both of England and Sentland. Dee Totlle-is also often extended to the gencrat Giuleqnsio am eruleblulon, genera very similar to Lumizon, the first of which is somutimes distinsuished by botanists as Hemp-nettle, thee second as Weasol-shout. Lamium purpuroun, L. incistm, I. album, and Caleopsis totrahit, are very common British weels, some of them appreaing in almost frery gaden, comfieh. or piece of waste-ground. L. purpurcum and $L$. cllium are sometimes boiled as put-herbs in sweden. It is probaby to fit tutreh it. or G. versiodor, also very common in Scotlanil, much larger plants, and rough with strong hairs, rather than to any surcies of Lemium, that the popular behef relates of a power residing in the hairs of the I. N.. partienlarly when the phant is driod, as in haymaking of cansing irritation in the hands of persins handling them, which, extending thruughut the system, occasiwally terminates in death. They do not, homever, sem to phssess any prismons property. The suliject is one perbaps deserving of mane attention than it has receivel.

DEAD-TECKONING, a term in Narigation, simifyiug the calculation of a ship's place at scal made independently of celestial olservations. The chief dements from which the rukunimy is madl. are: The print of degurture, i. e, the latitude anm lomgitude sailed from, or last deternined : the courwe or direction sailed in (ascertained by the compatis) : the rate of sailing-merswed from time to time by the Log (q.v.) ; and the time clalised. The varions principles or methonds followed in arriving at the reckoning from these data are known as plame suling, mudle lutiture suiling, \&8. Bies Shomwis. Sut the data thenselves are liable to momerons nucertainties and errors, owing to currents, lecway (1. v.), ductartions of the wind, chanres in the Weclination of the cumpass, \&c.; and thatefore 11 ee results arrived at by the 1), have to de currectal as often as is possilide by ubscrvation of the hearenty bulies, See Navigatos, Lathtine, Lumettene.
DFAD SEA (anc. Jotens Asphatites), malled hy Hhe Arahs lahe Locet, ar Nem of Lot, is situated in the somth-mast of Palestine, in kat. $31^{\circ} 10^{\prime}-31^{\circ} 47^{\prime}$ K., amil rucupacs a central fusition hatween homs :(a) and :ifo $^{\circ}$ E. 14 is abmat 10 miles lomg, with an average breatth of 9 miles. The depth of the $11 . \mathrm{S}$ barms consilerahly: senudinus in the worth have cisen alumt :200 fathuns; this depth, howeser, candally losens towarils the southern extremits: Whore the water is shallow. Its surface, which is lower than that of any watur finown, is $1: 312$ foen

The D. S. is fed by the Jordan from the north, and ly many other streams, but has no apparent outlet, its superfluous water being supposed to be entirely carried off by evaporation. Along the eastern and western borders of the D. S., there are lines of lold, and in some cases prarendicular cliffs, rising in general to an levation of upwards of 1000 feet on the west, an 2000 feet on the east. These clills are chietly commosel of liwestone, and are destitute of regetation sare on the east side, where there are ravines, traversed by fresh-water springs. The north shores of the lake form an extensive and desolate mudyly lat, marked by the blackened trunks and lyranches of trees, strewn abont, and incrusted with salt, as everything is that is exposed to the smay of the Deal sea. The southern shore is low, level, and marshy, and desolate and dreary in the highest degree; the air is choking, and no living thing to be seen. On this shore is the remarkable mass of rock called Ustum (Sodom). It is a narrow rugged ridge of hill, extending tive miles north-west, and consisting of rock-salt. Large llwels have lroken off from this hill, and lie strewn in all directions along the shore, adding to its dreary and deathlike aspect. To the north of Ushunt, and at no great distance, is the supposed site of the anciont sudom. Alhough the hills surrounting the I. S. are principally composed of stratified rock, yet igncous rocks are also seen; there are alsn 'quantities of post-tertiary lava, rumice-stone, warm springs. sulphur, and volcanic slag, elearly proving the presence here of voleanic asencies at some period. The neighbourhoal of the 1 . s. is frequently visited by earthquakes, on which necasions it has lueen observed that this lake casts $u p$, $t_{3}$ its surface large masses of asplaltum, of which sutbstance the cups, crosses, and other ornaments that are made and sold to pilgrims at Jerusalem chiety consist. The longentertaineal belief, that the exhalations from this lake were fatal, is not founded upon fact; birls hare been seen liying over, and even sitting alon its surface. Within the thickets of tanarisk and oleander, which here and there may be seen upon its brink, the lirds sing as swectly is in more highly-favourel quarters. A curious plant srows on the borders of the D. S., the Avelopias pirmera, which yields fruit called the Applas of soulum, beautiful on the outside, but hitter to the taste. and when mature, filled with filme and lust.

The water of the D. S. is characterised ly the presence of a large quantity of magnesian and soda salts, lts specitic gravity ranges from 1172 to 1227 (phare water being lown). The propertion of satine matter is so great, that whilst sea-water only eontains (3) parts of salts in the lowo parts, the water of the 1). S. contains abent こ.\%, or "ight times moro than that of the nexan. The saltness of the I. S. has lewen explainel in seroral ways; but there is no need to advert to more than une. It is a circunstance attendines all lakes or collections of water without any oitlow, that the water acquires an infusion of salt, its feelurs constantly lringing in this material, while une ean go off ly evaporation. It maly. moreover, be remarked that, if the 1 . S. was furmerly at a higher lewl, and brought down to its present piteh by evapmation, a deposit of salt, such as we sec on its banks, would be the natural

## DEAD'S PART-DEAF AND DOMP.

DEAD'S PALTT. The partion of the movalle estate of tho deceased which remains ower, after satisfying the legal clams of his wife and children, shonld he have left such, is homw in scotland as the dead's part. It is so callol, leeanse it is with reference to this portion of his possussions alone that he jossessed the pwor of dipusal by will or testament. The D. P. may be increascit ley romancia tions or discharges of their lemal rights by the wito or the children, so as to incluid the whole mavable estat, lut threse diseharges mant le expmes. The 1. I'. may also be intreascal of diminished by the conventional provisions of a marriage comtract. See Mablame Conthactr, abl Soctesions, Muvarife, in Scomavil.

A distrilution of the prossmal estate of the deceased, simitar to that which is still followen in Scothand, prevaled, in aceordance with the ancient customs, within the city of Lombon and the province of Jork, and was probally common to the whole i:hand (sce stephen's Conn. ji. 2one, anul note). These castons have now heen abo, lished $1, y 19$ and 20 Vict. c. !3. Sue Stccesston, Presonal, in Englast.

DEAF AND DUME. l'ersons who are born deaf, wh who lose their hearing at a very carly arge, are dumb also; hence the compand term deafcmidedumb. But the primary defect is deafness; dumbuess is only the consequance of it. Children ordinarily hear sommes, and then learn to imitate them; that is, they learn to repeat what they hear other persous say. It is thus that every one of as has learued to sucak. But the deaf child hears nothing; cannot therefore imitate, and remains dumb.

Persons wholose then hearing later in life aro not to be classel among the deaf and dumb. Having learmed to sleak before their hearing was lust, they can readily communicate with others, thongh deaf thenselves; aml if they are educateh, there are still ofen to them all the stores of knowledge contained in books, from which the jusenile deaf and dumb, iguorant of all written and spoken language, are attelly excludel. It is this latter class alone which we have to deal with in onr statistics, which is contemplated in our consus cumberations, and for which ow institutions for the education of the deaf and dumb are sprecially designed.

The term 'deaf anil dumb' is somewhat unfortunate, as cmbodying and repeating the error that the athiction is twofold. It aflects two organs, certainly, lat only, as above descrilud, in the way of canse and effect. The organ of hearing is wanting, lut the orgins of spech are present; they morely lack the means of excreise. The car is the guide and directress of the tongue; and when she is doomed to ferpetual silence, the tongue is included in the han; though, if we could by any means give to the ear the faculty of hearing, the tongue would soon learn for itself to fulfil its proper oftice. To correct the error inwolved in this apparent misnomer, some anthorities use the terms deaj-dumb and daf-mute. The latter seems to be a customary expression in America, as in France it is Sourds-mucts. In the IIoly Scriptures, the same original word is translated ' 'eaf', is some places (as in St Mark vii. 32), and 'dumb' or 'speechless' in others. (See Matt. ix. 33, and Luke i. 2n.)

This aflliction is very much more eommon than, fou* a long time, and up to a recent period, it was sulposed to be Haprily, however, along with the knowledge of its extensive prevalence, have come the means of alleriating it, by education. It was anly whan the schools now in existence began their usidnl work, and celused inquirics to be made, that the actual numbers of the deaf and dumb hegan to allu: In. In every flace where it was propecil to
establish a school in l'aris, London, Liverpool, Manchester, lorkshine, and in Now York-the objection was immenliat.ly started, that chideren could not lae fonm in sulfiniont numbers to reguine such sehouls. Their prom,ters, howewr, knew luetter than this, and prastent in their desiom. They som hal the satisfaction of converting the oljocetors into their wament smpmerters; ame the institutions thus establishen, in the localities just namel, an bow the largest, the most useful, and the most prosprous in the world.

The futs thas ase reainend, and the calculations hased upon them, continued to be the only statistim upon the sulpect of deafodumbess in (ireat lintian and Irelime until the census of 18:3: then, for the: first time in this comatry, the momber and ares of the deaf and dumb forncel a part of the inguiry. In Irelank, a further investigation was subserumenty made. which resulted in the collection of a mass of valuable information upon the canses of deafness, the sorial condition of the deaf-mutco and other lindred subjects, which has been published in a livport un the status of Disease in that country. There the inquiry was comlucted under a special conmission ; in Great linitain, it was directed by the recistrar-general, and its first purpose was to ascertain the number and ages of the deaf and dumb of each scx. It would have been well if it had been limite to this, for the educational statistics were grossly incorrect and deceptive. Perhaps the mistakes which were made were the natural incidents of a first attempt. If, in the census just taken, these errors are avoided, we shall not only whtain a raluable stock of recent ami more accurate information, lut we shall, for the tirat time, possess means of comparisnn, of the greatest importance. The number of children under instruction in the various schools is considerably greater than it was ten years ago; new institutions have been built, and oll ones enlarged to meet the additional clams upno them for admission. It is prohable that at least 1600 pupils are now in the varions schools of treat lytitain and Ireland, thongh in I853 there were but 1300. Many questions are suggested by this fact, which the census returns of 18111 may help us to solve. Is education more valued and sought after, or is the number of deaf-mutes absolutely increased? If the latter, is the imerease in exact [roprotion to the increase of population, or not? Do the numbers of those boru deaf, and of those who have become deaf from disease, preserve the same propurtion to each other, and to the general limplation? These are all questions of the greatest importance, and the possession of accurate mformation will tbrow light uron many of the dithiculties which surround this sulbject.

The latest available returns (those of IS5l) exhibit the following 1 articulars of the mumer of deaf and dumb persons in this comentry aur the proportion which they bear to the whole joprulation :

This result of 1 in 1590 for all the British population is very remarkable, on account of its close approximation to the averago for the whole of Eurone, which is stated in the same returns to be 1 in 1093. As to the local prevalence of deafness, it will be sern in the following talle that the proportion varies greatly in different parts of the kingulan:

## DEAF AND DUMB.

A comprison between the first item in the foresoing table and the last, shews us that in the northern counties of Scotland there are nearly twice as many deaf-mutes as in the northem comities of England : and the diversity in sume of the Euglish comuties is still more remarkalle. Thus, for one deaf-mute in Lancashire, there are two in Hereforelsuire: for one in Hutiugdonshire, there are thre in Herefordahire; for one in the Last lioling of Sorkshire, there are two in Worestershire; for ohe in Durham, there are two in Derhyshre, and tro in Cornwall.
llow far this aftiction is inevitalile, amh how far preventable be improved samtary arrancements, by madical science and skill, by the protence of individuals in avoiling marrage with hoonrelatiuns, or umions which are likcly to result in the transmission of constitutional defect-these are all y pestions which cannot now be determined. When the facts which bear upon the subject lave been fully ascertained, and the truth which they declare is phaced beyond question, it is to be hoped that we shall see the number of this afflineted class brought duwn to the puint at which it may be considered due to causes which are heyomeman's control, subject alune to the will of the All-wise, who revealed himself in the earliest ages of the worl as the maker of man's muth, of the Imuh and the Deaf, the secing and the Lhom (Exml. iv: 11). lint while social sefence is prosecuting this inquertant inquiry, I'hilanthresy has hetor, her the whe of elucating these "chiliten uf silence," townom the urdinary means of instruction are onsionsty inaplicahle, and for whom, matil a century aro. there existed no available means of enfucation at atl. Anntimen, as we have just seen, at the outset of man's history, by Moses: sumen of freyurutly in the writings looth of the Old and Now Testaments; alluded to by the pets, philosophers, and law. Privers of antiquity-we have no aceount of any attompt at edncating the deaf until the $15 t h 1 \cdot ;$ in selow ex exted for them until the mildde of tha lath ; mor eould it lie said that chucation was iredy whimen, and romly accessible, until within the last thirty sous. There are mow in Eurnu and Ammica alont :200 seluoden for the deaf ant humb. In the same comentres where this provisinn is matc, them Wrer, seromding to the latest returns una the
 than', ithut lif per cont, are of the promer are to We at schmi, but nowhere is this preportim romboh.
 in the I'nitml states. In only a few countrics are the retums suftiojontly wont and areurate
 in then is shown he tho fithowitu: In the Initur Status, there were 1162 at schand, sut of $977=12$
per cent. ; in Scotland, 2.00 at sehool, wit of $2150=$ more than $11 \frac{1}{2}$ per cent, in Endam anl Wrales, 816 at school, out of $9543=8$ per cent.; in France, 1642 at school, out of $29.512=5 \frac{1}{2}$ per cent. ; in Irelaud, 234 at schoul, out of $4747=5 \mathrm{prr}$ cent. Thus, of those who were of the proper school-age, there were actually under instruction only $34 \frac{1}{2}$ per cent. in Ireland. 50 jer cent. in England, and 70 per cent. in Scotland. The next returns may be expected to shew a large increase upon these numbers; and if it should lee thought that this is but a meagre result, it must be remenlicred that only within the present century has this work of edueating the deaf and dumb taken a systematic and practical shape at all. Yet luring this period-that is to say, since 1792, when the Lomion Asylum, the first pmblic institution in this country, was estab-lished-between 7000 and 8000 derf-mntes have been elneated in the schools of Great Britain and Ireland, and upwaris of 5000 in those of the Thited States siuce 1817. Add to these the pupils of the rarjous cuntinental institutions simee 1760 , when Te l'Epée collected his little group of children in the enrirons of Paris, and Thomas limilwood nqened his school in Edimburgh, and we should then sce that the fruits of these men's labours have nut heen meagre, but great and marvellons. Some isolaterd attempts had previously been made, liy different men, in diflerent countries, and at long intervals, to give instruction to one or two deat and dumb persons, and their endeavours had been attembel with varions degrees of success. These screral cases excited some attention at the time; lut after the wouder at their nuralty had subsiden, they suem to have been almost forgoten, even in the conntries where the experiments were made. Bede speaks of a damb youth being taught by one of the early English Dishops, kuovn in history as st John of Beverley, to repeat after hin letters and srllables, and then same words and sentences. The fact was resarded as a miracle, and was elassed with "thers alleget to have been wrought by the same hanc. From this time, cight centuries elapsed lefore any recond of an instrneted deaf-mute oceurs. lionnlphus Agricala, a native of Cröningen, lom in 14!, mentions as within his knowledge the frect that a deaf-mute had leen taught to write, and to note dom his thoughts. Fifty years afterwards, this statement was controverted, and the alleged fact pronomeed to he impossible, on the 1 mum that nustruction conld lie conveyed to the mind of any one who conll not hear worls aldresspal to the ear. But the discovery which was to give the key to this long eoncealed mystery was now at ham. In $150 t$, was lorn, at l'aria, Jemme ('arlan (4. v.), a man of sreat hat ill-regulated talents, who, among the nume. rums speubations to which his restless minn promptal him, certainly diseovered the theoretical principle uron which the instruction of the deaf and (lumb is foumder. H1, sars: 'Writing is assereiatuel with epech, and suech with thought; lont written characters am? inloas may be connecterl torgether aiflonet the intervention of somuds,' and he fremes that, on this primille. 'the instruction of the duaf an! dumb is diftionlt, hut it is possible.' All this, which to ns is ohsions ind familiar, was a nuwel speculatim in the lith century. With us, it is a common thine for a man to teacla himself
 There are, fin iustance, lmalreds of persons who can real fromeh, who do, not and commet speak it. Xow, it is winknt, in this case, that written or printed words do impart ideas indepemdently of someds, yet this was a discovery which the wordd
owes to derome Cardin ; and it was for want of secing this trath, which to hes is 80 fimmatiar, that the elacation of the deal :um dumb was nowr attempted, but was considereal for so many centurins to le a thing impossibn. It was in Nowin that these principles wore first put into practioe loy Pedro l'once, a Bumedictame monk, bora at Vallitdolial in t50 0 , and again, a century afterwards, by another monk of the same owler, Shan limk, Thnet, who alsu publisherl a work una the sulb. ject, which was the dirst stell thwards makines the education of the deaf and dumb 1 ermanmat, by recording the expricuce of ane teather fir the instruction of others. This laok, publishen in 1620, was of serviee to 1ho l'fée 1 an yars later: and it contains, besides much valualile information, a manual alphabect identical in the main with that one-handed alphabect which is mow in common use in the schools on the continent and in Auerica. From this time there was a general awakening of the attention of intellectnal men, not only to the impritance of the sulpeet, lint to the macticalility of instencting the deaf-mutc. One of Bonet's pupils was sceu by Charles $I$., when Prince of Wates; and the case is described ly Nir Kenclm Digly, who was in attendence uren the prince, on his memorable matrinmial jonney into Spain. When the art died away in that comery, it was taken up ly Endishmen, and legan forth with to assume an entirely new aspect. In Johlin Eulwer published, in 1645, his Philucophas. .1. the Denfe and Dombe Mene's Primen; Dr William Hohter published his Ettments of speech, with wh Appendic concerning Persoms Deaf and Dumb, in 1669; and Dr John Wallis, Savilian I'rofessor of Mathematics in the miversity of Uxford, both tanght the deaf and dumb with great success, and wrote copionsly unon the subject. In 1662, one of the most proficient of his pmpils was exhilited before the Royal Society, and in the presence of the king. The Philosophical Transections of 1670 cuntain a description of his mode of instruction, which was destined to bear ample fruits lomg after his death.

Before the close of the 17 the e.. many works of considerable merit apmeared, the chief of which are the Surdus Loquens (the Spaking Deaf Nan) of John Conrad Amman, a physician of IFarlem: and the Didescolormphes, or isaf and dumb, Man's Tutor, of George Inalgarno. This treatise, published in 1680, and reprinted a fow years ago by the Matland Club, is eminently sound and practical, which is the more remarkable, as the author speaks of it as being, for aught he knows, the first that had been written on the subject. Ile is the tirst English writer who gives a manual alphatet. The one described by him, and of which he was the inventor, is, most probalky, the one from which our present two-handed alphabet is derivel. Dalgarno was by birth a Scotchman, bot was toner resident at Oxford. He died in 1687, and Dr Wallis in 1703. From that time until I760, nothing move was done in this country-though the subject was leginning to excite some attention in France-to resume the work which had been thons far prosecuted and helped on by the writings and lahomes of these eminent men. In 1760, when the Ahe De l'Epec was opening his bittle school in l'aris the first scheod in the British dominions was also estahlished in Elimhurgh, by Thomas Braidwood. Ite commenced with one pupil, the son of a merchant in Leith, who had strongly urged him to carry into effect the plan of instruction followed by Ir Wallis, and descrived in the Philosophical Transections ninety years before. This school, the parent and model of the eartier British mistitutions, was visited and spoken of by many of the influential men of

## DEAF AND DUMB.

Thus, it is to the present century that the honownable distinction belongs of having done so much for the deaf and dumb; and this has not been by inventing the art of teaching, or by raising up the earliest labonrers in this field of usefulness, but hy foumling ant supporting public institutions for this juronse. De l'Epée, when he opened his school in 1-6\%, bad no foreknowledge of the work he was commencing. As his labours increased, he invited others to his assistance, and they were thus embled to carry the light of instructon elswhere, and to keep it alive when he was mo more, His death took place in 1789 , and his assistant, Sicard, suceceded him. Four years afterwarls, this school was alopted by the French govermment, and now exists as the Imperial Institution of l'aris. A pupil of the same Institntion, M. Laurent (lerc, on leing applied to in 1816 , eonsented to go to the United States with the founder and first principal of the American asylun, and he became, like De l'Epec, le Pire dra Sourls-mauts (the Father of the deaf and dumb) in the New Worla. From these small beginmings of Drailwoml and De l'Epee, of Heinicke in Gerwany, and Gallanlet in America, have arisen, within a contury, 200 schools for the deaf and lumb. In Great Britain and Ireland there are 20 institutions, 16 in the Tnited States, $\alpha$ in British America, abont 70 in Austria, Prussia, and the smaller kingdoms and states of Germany, 50 in France, 10 in Italy and in Switzerlani, the same number in ITol. lami and Belcium, 5 im the Danish dominions, 3 in Fussia aud Polaml, 2 in Spain, 1 in Portugal; anıl the effort is heing male in one if not more of the great centres of porulation in Australia, to provide cducation for the deaf-mnte at the antiporles.

The mental condition of the deaf and dumb is so peculiar--so entirely unlike that of any other branch of the human family-that it is extremely dificult, without rery close thought, to obtain an accurate conception of it. While almost every nue will rombly admit that there is a wide difference between a deaf and a hearing chill, very few, who lave not bal their atterition painfully drawn to the suliject, bussess any adequate notion of the diflerence, or comll tell wherein it consists. Sometinots the deaf are compared with the blind, though there exists no proper ground of comparison between them. Excelet that the lilind are more dopendent than the deai and dunh, the relative disalvantages of the two classes in not admit of a moment's comparison. The blind gan can be talked with and read tos, and is thus 13nced in direct intoreourse with the word around him: domestie converse, literary pleasures, politieal excitoment, intellectual research, are all within his reach. The person born deaf is utterly excluded from crury one of them. The two alllictions are so essentially dissinilar, that they can only be consilered and sumen of torether by way of contrast. Each uf thom atfeets both the [hysieal and the mental constatution ; but blindness, which is a grievous budily abliction, falls but lightly on the mind ; while the effect of leafness is the extreme reverse of this it fonslies only one bodily organ, and that not visibly, lut the ealanity which befalls the mind is one of the ursat clesperate in 'the eatalogue of human woes.' 'I'be deprivation under which the borndeaf labour is mat marely, or so much, the exclasion of sount, :14 it is the complete exclusion of all that informalint and instruction which are empeyed to our mimls, ant all the inleas which ares suggestod to Hiem, ly means of souml. The deaf know almost aullimg, lowans they hetar mothing. We, who do 3:"म, acyure lanowlonge throusl the medium of mantoge - thanght the sonnds we hoor, and the
 [anl himat, "heed teils them nothing, because they 112
cannot hear; and books teach them nothing, beeause they cannot read; so that their original condition is far worse than that of persons who 'can neither read nor write' (one of our most common exjressions for extreme ignorance); it is that of persons who can neitlier read, nor write, nor hear, nor surak; who cannot ask you for information when they want it, and could not understand yon, if you wished to give it to them. Your diffenlty is to understand therir difficulty; and the difficulty which first meets the teacher is, how to simplify and dilute his instructions down to their capacity for receiving them.

A class thess cut off from all communication through the ear, can only be addressed throngh the eye; and the means employed in the instruction of the deaf and dumb are - 1 . The visible language of pictures, and of signs and gestures: 2 . The finger-aljhabet (or Dactylolory), and writing, which make them acquainted with oul nwn written language; and, in some cases, 3 . Articulation, and reading on the lips, which introdnce them to the use of spoken language. The education of the deaf and dumb must be twofohl-you must awaken and inform their minds ly giving them ideas and knowledge, and you must cultivate them by means of language. The use of signs will give them a knowledge of things; but to this must be added a knowledge of words. They are therefore taught, from the first, that words convey the same ideas to our minds which pictures and sims do to theirs; they are therefore required to change signs for Words until the written or printed character is as readily understood as the picture or the sign. This, of course, is a long process, as it lias to be repeated with every word. Names of visible objeets (nouns), of visible qualities (adjectives), and of visible actions (verbs), are gradually tanght, and are readily acquired ; but the syntax of language, abstract and metaphorical terms, a copious diction, idiomatic phraseology, the nice distinctions between words ealled synonymous, and those which are identical in form, but of different signification-these are far more difficult of attainment; they can only lee mastered through indomitable rerseveranee and aplication on the part of the pupil, in addition to the utmost skill and ingenuity of the teacher. The wonder, therefore, surely is, seeing the point of starting, that this derree of advancement is ever reached at all.

Fet it has been set fortl by otherwise respectable authority, that the deaf and dumb are a - tifipel race;' that they are remarkable for 'their promptitude in delining abstract terms ;' and those who ought to have known better, and who did know better, have strengthenel this delusion, if, indeed, they did mot cause it, ly such proceedings as the publication of 'Essays' purpurting to be 'ly the Deaf and Dumb.' in which the pupils wrote better linglish than ihair master: and by putting fortly, as the bona-mile answers of deafmutes, those lorilliant aphorisms and detinitions of Massien and Clere, which are so often quoted at public meetings, ly eloquent apeakers whe know nothing of the suliject. It is very well known to those who are acpuainted with the subject, that the so-ealled detinitions, of Mope, Gratitude, 'I'me, Etornify, \&e., were mot Massien's at all, but those of his master, the Ahbe sicart. The influence of these fallacios has been most mischievons; they raise expectation to an unreasonable height, for it is thought that what was done by the celebrated muil cit the Abse sicard,' may be done every lay: and disapmintment is the inevitable conscquenes. The lomest, halorions teacher who eannot produces thase marvillous results, and will not stonp to deception, lias often to labour on without
that appreciation and encouramont which are so eminently his due; the cunse of deaf-mute: instruction suffers, and a young institution is som.times erippled by the failure of support, which was first given from one impulse, ant is unw withdrawn from another-not a whit more uneasomable than the first, but very unfortunate in its ennermeners.

The course of instruction is very much the same in all the schools of this comery, ln the lomenn Asylum, and in Donaldson's Hospital, Elinhuryh, articulation is professenly and systematically tand to every pupil. In cther liritish institutions, it is taught in certain cases only. Very deeded and opnosite riews are heln unom the subject, lout the question is practically determinerl in most cases ly the finaneial lifticulty. It would repuire more time and a larger staff of assistants to teach artioulation, in adlition tw the other subjects of instruction, than the moderate means of the institutions generally could afforl. The Metrowitan Asylum, and the noble foumlation of James Donaldson, near Ealiuburth, enjoy ample funds; and these, it is to be hoped, will always be alplied su as to give to the deaf and dumb every edneational advantage which they are capable of receiving.

The mamal alphahet in common use in the schomls of this comotry is the two-banded one, thangh the

wher is used in some of the Irish institutions, and is rogarded with favour by a few of the Enchish teachers. The arguments in its favour, like those for the decimal curreney, may probably be admitted: it would le butter if we had it. But the rival system has got prossession, and is in familiar use, and persons are apt to think that the inconveniences of making the change would outweigh the advantages to lee expected fromit. The institutions in Great Britain are supported ly annual subseriptions, donations, and leyacies, anil by the payments of purils for
their hoarl. 'Thu larer bunfactions are invested, where the ammal inome from ordinary sonrees will admit of it. Committees, chosen fiom the body of

Two-handed Alphabet.
suhscribers, direct the affairs of these institutions, the executive offeers leing the head-master and the secretary; but in some cases the sole eharge is intrustenl to the prineipal. The gentlemen who fill this office have devotel their whole lives to the work; some of them have also done sennl service hy then writines upon the subject. Mr Maker of Domeaster, Dr Scott of Excter, and Mr liuxton of Livernool, bave all helper to make it better known and better understool than it could fossibly be when it was treated by men with mo practical knowledge, as a merely literary trive, or a subject of philosophieal euriosity. Justice also reyuirns the mention here of the valuable writings of $\mathrm{Dr}_{r}$ Peet of New York, and other American instruetorg of the deaf and dumb, The institutions in the Western World are mumificently suphorted ly grants from the states, and apmar to leadmirally managed. The staff of teachers is numerons, able, and efficient, and a hish degree of suceess may fairly be expected where the work is earried on umfer advantages which are unknown in the schools of Great Britain. New York contains also a church for deaf-mutes, of which the Rev. Thomas Gallaulet, son of the founder of the American Asylum, is the minister, and where at least nne service every Sumby is conducted in the lamouge of sions. At a meeting held muker the presidency of Bishop Potter, to promote the erection of a new chureh, Mr Fallanket stited some interesting facts concerning his littlu flow. 'From October 1852 to May 1858, there had been laptisel 11 adults, of whom 10 wore deaf-mintes; and 33 children, It of whom hal deaf-mute pormen. Thirty-six porsons had been contirmed, of whom 26 were deaf-mutes; 21 couples
married, 10 of which were deaf-mutes; 30 linials had taken place, $S$ for deaf-mute persons, and $\because$ for chilitren of deaf-mute $l^{\text {rarents } ; ~ a n d ~ h e ~ h a u l ~ r e c e i v e d ~}$ S.: communicants, 43 uf whom were deaf-mates.' "The same necessity" whith bere is so alminally met. must erist in all large communities. In Lonlon ami Manehestex, special armangements have been made to minister to the adult leaf and dumb; and in some of the other large towns of the kinglom, Sumtay-services are held for the former pupils resident in those localities. The desirableness of some agoncy to supplement and contime the work begun in the institations, in ader to murove the condition of adults, has latterly heon in consideratiom.

A novel experinent is now in operation at Dlanchoster, where a school for the infont deaf and dumb) las bren estahlished. It owes its origin to the persevering adveracy of Thonas Tumer, Esq.. an eminent surgeon of that city. It was opened on the 26th September 1860. When 26 canulidates, of ages varying from six years and eleven months to tluee years and fire months, were admitted. In the Liverponl sclwel, the age of atmission is seven years. and this has lreen found to work well; bit the minimum age of adnussion into most of the other institutions is from eirht to nime years. Now, as soon as a chilil is able to learn anything, he onght to learn something: and deaf children ean with lifficulty lie kept out of mischief and clanger, even when under watchful wersight; lont in the manufacturmg districts, where female latrour is valualde. the mothers of families are freguently absent from their lomes, at work in the factories, every day of the roek. It is this ciremastance which makes Nlanchester the best fielsl for an experiment of this kind. The lncal necessity is veculiar, and the spivit and energy which lave leen eulisted in this work will go far to insure its success.
'These are the means at present employed for the benedit of the deaf aud elnmb, aml it is no small honmur to the prescnt century, which las wen so many proml distinctions in other fields of enterprise and uafuness. that it shond have done so much fur those who for so many genurations were utterly excluded from light and linuwledge.

DEAF AND DUND (in Law ). From the imper. fect methorls formerty in use for the erlacation of the deaf and dumb, they were almost ceveryhore belat to be legally in the same pmsition as ithots and marlmen. The lioman liw helel thew to ln incapable of consent, and consequently unalude to enter into a lognl obligation or contricet. lontlu in Pneland and S'obland, the anount of their eapacity is now a puestion of fact, whieh, in ease's of doulit, will be roforred to a jury. In the some manner, a mate will lne examinely as a withess in referd to a fact to which the is capable of bearing testimony, and the oxamination will be conducted in the manom which sepms most likely to clicit the truth. (Fest, Lan of bevilenre, 5 , 2(1).) The same principle will when the restimate of his responsibility for crime. (Ntrimmes rom. iv. Afl.) It is of enirse legally, is it is physieally, inmussible that a mute shonlid act as a juror.

 lop permannt "r anly temporary, and is but tow oftor obw of the distressing sympene of advancing

 will at once romak the extmorlinary intricacy of the horimg-ajprabtus theredeseribud, and will easily "rmondre that althomed it ine constanod in a little mat of rhasent home (the putroms portion of the temanmald, till it is exposed to many deterionating
inflnences, and that very slight cithses may disarrange the exquisite adjustment of its parts, 1. The auditory nerre may itself be unsusceptible to the stimulns of sound, from some discased condition at its origin in the lorain, or at its limal sulalivision in the labyrinth. This is termed nerwous duafness. $\because$. The structures which conduct the viluations of soumil to the lahyrinth may be faulty, from accident or disease. S. 'the passage leading to the tympramim or drum may be blocked n]. 4. The cavity of the lrum may lave ceased to be resonant, owing t" deposits from intlammatory attacks, to loss of its membrane, or air being excluded, from obstructions in the passarge lutween it and the gullet (the Eustivelian tube).

Nervous deafuess may be caused by a sudulen concussion, as from a 'box on the war,' or a general shock to the whole bory, as in the case of the celebrated $\mathrm{Dr}_{\mathrm{r}}$ Kitto, who lost his hearing, when a loy, by a fall from the top of a house. The concussion from lond sounds sudtenly taking the ear namwas, lefore its small muscles have time to prepare thematlyes fin the shock, canses the deafness which follows the liring of cannon. Bwen a lonel yell close to the car has been sufficient to destruy the hearing-pwer on that sule. As such an accident is genemally accompanied by an increased How of blooil to the part injured, it may be relicved by the application of leeches, apmied lochand the durdede, and the ear shomld for some time be protected from bral somuls as carefnlly as lossithe. In some of these cases the nerve gratially recovers its sensilility, but in many the deafness continues, anil is aceompunied ly a listressing singing in the ears. Expmsure to enhl affects the auditory nerve; and renty jersons, or those who are suthering from the poisoms of typhus fever, scarlatina, measles, mumps, \&e., frequently become deaf, Somo nedicines, as rumine, frolnce nervous deafness ; so do debility and mental excitement; but all these causes seem to act in one way-viz., to nicrease the tlow of blood to the ear, and should be treated accordingly.

The solid conluctors of somat to the auditory nerve may be imjured of diseased, so that the viluations are interrupted. One curious cause of leafuess has been recently shemn to exist by Mr Juseph Coyzbee of London-viz., an increasing stitfiness in the little joint hy whirh the stimu; hone moves in the oval window of the restibule; this stiflness prevents the base of the stirrup pressing inwards sutiaciontly tos affect the contents of the laloyrintla, therefore it ceases to keq the anditory nerve an rapmon witl the membrane of the dymm. This conlition may be recomonsed durines life by the rationt losing the power of adaptions lis heaning to varyung sounds. 'Two persons spoaking at once frevents his hearing the vaice of '口thor: thore is a comstant buzzing in the car, and hergets deafer amil deafor day by day. This curions discase is fredumbtly associated with gont and rhemmatism, ami in its carlier stages may be intlumem hy the simm romaties as these; but if one estallishod, it is inemable.

Smunt ranchas the anditary nerve through the vilaratime of the bermes of the hear, but chiedly throuth the extran urnine in the auricle, tho phasage lealine from which is shat at the depth of an ind isut it gatarer from the surace by the membrane of the drom strethimeteross it. Should this passage he bloclied up, so that the sounds can no Janer pase alno: it to mumbe umon the membrane, cither total or partial eloafonss must rewalt.
'I'lue most common ofstruction is an acemmulation of tha" wax socrotorl by a small bing of glands nowr the orilice. The oljacet of this cermanen or wax is to

eatch the particles of dhest thatine in the : atmonphere;
 gratarally expelled by the muvomumits of the jaw in spoking aml catine. At lust, it tills the passicge in
 pass through it nor by its sume ; if luft, it gradually causes serions changes in the shane: of the possinge, ant even symptoms rescmblang lisitase of the bam. Sometimes foregm borlies timl their wiy into this
 attempts should ine male tornowe then, lest the membrane of the drum lu injures. It is but selfonn that any instrumbents are meressary in addition to a strean of wader thrown brishly in by means of a syringe, with at mozla smaller that the circumfurence of the passare blomht the wask be very firm and harel, it is well to soften it by dropinits in some oil or an alkaline solution. lint even a strean of water, maloss preat care be taken, may injure of burst the delicate nembrane tympani, and the proceding leave the patient suffering from a more serions concition than before.

A membrane, to be resonant, must lave air on both sinles of it, aud the membrana tympuni obtains this essential ly means of the Eustachian tube, the lower oritice of which, on each side of the gullet, opens for a lnief period at each act of swallowing, and admits a small quantity of air, which ascends into the tympanie civity, if the tube is in a healthy conlition; but frequently in persons sufforinis from relaxed mucous numbrane, the Eustachian passage becomes swollen and inamssable, or blockel up by some thickened mucous seeretion. During a common coll, persons often sutfer from this canse of deafness. It has heen supposed by some, that eulargel tonsils may interfere with the pharyngeal opening of the tulie, and with that view they cut portimes of them oceasionally with great benetit to the condition of threat in which these glands are enlarat ; lat the latter are situated below and in tront of the Eustachian tubes, and canmen be the immediate canses of the obstrnction.

In sone cases, the ancmlrane of the lrman may Je perforated; and thomgla the more premation is mot sudheient to cause mowe than a slight degree of deafness, if the muconts membrane lining the tympanic cavity le thickened at the same time, the person is usmally able to hem only the lowdest sounds. If the perforation le stopuedil up, however, the air confinesl in the tympaic cavity vibrates sutheiently to stimalate the anlitory nerve, through the roumd window of the lalyrinth, ant a useful depree of hearing is restured. In 184s, Mr Yearsley of Lomion shewed that a small pellet of cutton-woul might be used for this furpose. It should be moistencel with fine oil, and inserted on the cad of a probe. Jatients gencrally learn how to stick it neatly into the aperture themselves. It slondd be removed every three or four days, or oftencre, should cleanliness require it.

Nr Toynbee has inventor an artificial membrana tympani of valeansed intha-mbutr, attached to

## Artificial Membrana Tympani.

the "hot of a time silver wire, by which it an bu inserted ur withotrwn. These loantiful litthe instruments may now be ubtainel oif every surgical instrument-maker, and art at least worth trymu in cases of perforated mombrana tympani, as they otten doginod, ean do no harm, anil are very cheal.

DEAN. The bustitution of deaneries, is of other ecelesiastical ofthes of dignity, Inars a resemblunce to the methois of ancient cisil suvermment. Thus, for the preservation of civil order, every humbed consisted of tin districts, called tithines, and in every tithing was a constable or civil de:in. In confominty to this, the spiritual grow rnors, the bishops, divideld each dinesse into deancries or decemarnes (Lat, derem, ton), corresponding to tithings, each of which was the district of ten parishes or churches, over arry one of which a 11, was appointed, who in the cities or large towns was called the 1 . of the city or town, and in the comentry, mevel dean. It has laten supposal, but on mo certain anthority, that the 1). If a chapter was appointed to superintern tea "anoms. but it is more probable that the name was wiem to the "ffice from its andang to those above duscriturl. In the Finglish Church, there are the follummindignitures who buar this name:

1. In the province of Contermary, it is part of the dienity of the archbishop ta have prelates to he his ollicers, and of these the bishom of lounden is lis
provincial D. ; and when a convocatiou is assembled, the archlishop sends to him his mandate for summoning the lishops of the province. This is the sole example of the kind.
2. Monorary Decens, as the D. of the Chapel Royal of st James's.
©. Deans of Peculiars, as of Battle in Snssex. fororled by William the Conquerur in memory of his conquest. There are also the Deans of the Arches in Lonfon, of Boching in Essex, and of Croyton in Surrey, who have jurisdiction, but no cure of sonls.
3. Deans of Chopters, as at Canterbury, St Paul's, sc., who are governors over the canons in cathedrals and collegiate churches. Their appointment is in the direct jatronage of the crown, which may appoint loy letters intent: and the D. so appointer is entitlel to be installed. The D. of a chapter must reside eight months in the year, and he may hold one lienctice with his deanery. The income of the office is, in the case of Durham, $£ 3000$; of $S t$ Paul's, Westminster, York, and Manchester, £2000; of "ther catherlrals, tloou, except St Davils and Llandaff, which have 2700 . See Cathedrat.
4. Rurnl Deans. These are very ancient officers of the church, but custom gralually transferred then duties to the archleacon, as in the visitation of churches, Yarsonare-houses, \&c. They may, however, act as deputies to the hishop and archdeacon; and of late the office has been revived with great adsantage; and in well-ordered dioceses atfords a uscful channel of communication between the bishop, and his clergy, and a means of joint action in matters affecting the church. There are altorether nearly 600 rural deaneries in Eugland and Wales.

In the umsersities of Oxford and Cambridge, the $D$. is the officer who superintends the discipline of the college and the chapel services. At Christ Church, which is a cathedral, the I). is master of the college.

DEAN OF TIIE CIAPEL ROYAL (Scotland). an whice held by three elergymen of the Esthhlished Church, to which they are appointed by the crown. The duties are nominal, being limited to an occasional sermon before her Majesty when in Scotland, and attendance at the election of the representative jeers. Recent appintments, however, have been conferred in connection with chairs in the university of Edinburgh which are not otherwise emfowed. The title of dean is somewhat out of place in the Chureh of Scotland, where the mule of Preshyterian parity is established. It is a remmant of Episcopars?, which the church comets have never had ocension to challenge, as the deans do not sit or act in that capacity, and lave scarcely any ecclesiastion duties to perform. The benctice of the clapel Royal, which was instituted ly James $V$., was richly endowed, lat it has bern disputal whether the revenues now enjoged hy the deans belonged ariginally to the Chapel liayal of Stirling ar to the Chapel Royal of Ilowroml. It is known that the existing revenues Were meen attached to the sue of Whalane: and an ant of promment was passel in 1603 , sanctioning the sumexation of the revernus of the Chapel lingat of Sitirling to the hishopric of bunblane, which was the prorest lishopric in Scotiand. Henco it is assumme that the: whole existing deanery resemues lofongel to the ('hapel Lioyal of stirting. But there are sume ficts which prore that the Inarfine was comacted with the chapel at Holyrood equally with that at starligg. Willian Couper, bishop of Gathoway, hath the ollice of bean of the (linfel liwal from litis to tho commencement of 1619. Whe resilen at the frot of the Canongate, amb prached regularly in the Tiogal Chaped of

## DEAN OF FACULTY——DESTM

Italymokl. This indivialal Arew bart of his revenue from the puislues of kirkinner aml kirkcowan in the connty of Wirenn, and purt of the present deancry revenmes is likewise drawn from the same parishes. Ior Adam liellemben, who, was Bishol of bunblane when the act above mentional was passed annexine the revenuts of the "hagel Jioyal of Stirling tor his hishmprie, InTforned tha duties of Dean of the (hapel linyal at Jlalymond for many years suldscupent to 16.3 . It seems chear, therefore that if the revenues of the lemelice wret evor divided between the two elatuls, they wor minted to the see of Donblame thring the incmanbency of Dr Bellemben. 'The state of the cabe prolithly is, that at its institution by domes V., who resided freduently at stirling, the lumetiee was hedd by ecelesiasties chiefly resident there. The Chatel Jungal is moticed as mind onuration in stimhen in I5to. During the reign of (eneen Nary, the Clapel linyal secms to lave been at Jlehyroml. In lata, again, after the Reformation, the mane of Johne Dumeaneson appears as minister of the Chapell Ruy;ull, or lings Ilouse at Stirhim, where James VI., then very young, resided; while at Ilolyrood the minister was apparently the rogular parish ministef of Canongite, and not counceted with the Chapel linyal. Afterwards, when the riyal residence became tixid at Inolyroot, the lean of the Chapel Poyal oficiated in the chapel, of which abundant frouf exists in the history of the feriod. The chapel at Stirling was left to decay; whereas during the reigns of James VI., Charles I., Charles If., ani Janes VTl., the Chapel Lioyal of flolyroml was repained and embellished. The last of the Stuarts laid ont considerable sums for the purpose only the year lefore the revolution. The revenues of the benefice fell to the crown, jure rorone, on the aboli. tion of Episcopracy in $I 6!0$, aml have since leen gifted at the royal pleasure. For a lonu berion, the emuluments were not at all consideralle, owinis to the practice which existed of giviner tacks or leasers of the Teinds ( $q . \vee$ ) to the proprietors of the lands at nominal rents. In consepucuce of the temination of some of those leases in 1841, and the deans leang debarred in the gift of the apmointment from aceepting anything but the full yoaly value of the revenues, a very meat increase in the emoluments has gradmally taken phace. Jn 1841 . the amonat maid to ealch of the three deans was only $\pm 84$, in 1850 it was ezon. "I'be present anmual rental. which is divided amoner the three deans, will probably amount to $む 2400$. A large proprortion of the whole rovemue is chawn from the parishes of Yarrow and Ettrick, and the remameler from parishes in the comnty of Wiston, Kirkemibright, and Ayr: A small shm is alse drawn from the parish of Crieff, in the comnty of Perth. The present holders of the office are Ir Numman N'Leod, Glasgow, and I'rofessors Thobert Lee (Jiblical Criticism) and Crawford (Divinity), of the university of Etinburgh.

DEAN OF FACULTY, the presilent of the incorporation of advocates or barristurs in seatlamt. Like all the other utheers of the b'aculty, the Dean is elected ammally. Is a general rule, he is re-elected till he is promoted to the liench, when he censes to take part in the deliberations, thoursh not to he a member, of the boly. See duvocire.
I)EAN OF GUHLD. in Scoteb lurgbe, wis the Lual of the mercantile borly called the cruidu. Incthren. See fivilis. In former times ( 15038 , e. I 80), he was a juslere iu mercantile and marntime causes within the burgh, but for a very loner perion he has been mather what might be callet a kind of scotuh edhle (y. ..). Ilis chef duty is now
to sere that budinges within the Jureh are erentod acenrliner to law, that they are sullicient, and, in sase of their falling into ia ruimome condition, to orveres them to bu pulled rown. Thoursh in sompe of thos

 his jurisdictma is altocethor separate from that of the brilio-enurt. In bilinhargh, the 1). of (r. conrt, in axdition to the I). of (i., comsists of at cenneil of merchants and tralesmen chensen ammally, and of the ohe wr iommer beats of finidd. "They are assinted by the law assessong of the manistrates of the "ity.

"Hposition to the issuine of the wamant Hay le offaci, either lyy a private party, ar hy the prommathr-fiscal of the conrt ituelf, actins fon the public interest. The enformmat of the act 1608, c. $S$, as to the height of buiblines, the thickness of tho walls, Re, lies within tho povinco of the 1). of G . court. The jninnents of the D . of G . eonrt may le reviewed hy the Connt of Session.

DEAN FO'REST, a pictmesplue lilly tract, 2., 000 acres in extent, in the west of Glonernt r shire, luotween the Severn and tly Wye. It is mostly erown-property, and about hali of it is enclosed for the growth of timber for the nary: Jt contains oak, beech, \&e. woods; orchata, juelding the famons Styre apple-cider; coal amt iron mines ; and stome-quarries for ludding, qrimeling, and makiner tronghis and rollers. It is divided into six walle. fop. 10,6 , chiefly miners, once a lawless set. 'I'ho former imhahitants had many ancient privilegesaceuired ly birth, and liy working a year and a day in the Forest-viz., cxempinin from rates and tixes, free pasturage, right of mining-a sixtly if the produce being due to the soveroign, and aceos to the woods for timber for their works. I. $\bar{F}$. is soverned by a lam-wamben, six depnty-wardens, awd otber officials.

TEATII. It is one of the fumlamental doctrimes of physiolory, that tury part of the organism bas its own detinite term of vitality, and that there is a contimons suceession of the destruction of ohl cells and the farmation of new onns in all tinsure, and especially in those in whinh the must active vital changes are soing on, as, fur exomple, in the nervons and nuseular tissues. Dren the mast solicl portions of the anmal frame. such as the bones and (tur a less extent) the tecth are muler*oing a perpetnal although a slower chane of this nature ; and thromenout the whole bonls, there is a continuous removal of effete or worn-ont tissuta, and a correspondimg deposition of nws matter. Livery How we strike, every thoneht we think, is aecompraned by the death and disinterration of a certain anoment of muscular or norvors tissue as its necessary eondition; and thas every action of our corproval life, from its leminning to its close, takus place at the expense of the vitality of a certain amount of organiscl structure "This is tormed molevulur D., and, withins its proper limits, is obrinusly essential tu the life and wellbeing of the orqanism.

The cessation of the circulation and resuration may lie remareled as ennstituting commetic D., or the I). of the entire organism, whicle must obvionsly lee shortly follewed hy the mulectar D. of every portion of the bomp:

We shat muw liribly motice the princinal mores in which 1). vecurs. 1). hapleas either from the natural lecaly of the oryanism, as in rhe age, or (and much nore frepuently) from some of those deranmements or lesious of the vital organs which oceur in the conrse of the distases and injuries to

## DEATH.

which we are liable. These derangements of the vital oreans may oceasion variuus modes of "fring. In Watam remarks in his Lectures on the Principles and Irontice of Physic, that life rests wh a tripmed, whose three vital supports are the lumet, the brain, and the lanas. Throngh the imparad funetions of "ne or more of these "rgans, the tendency to 1). is expresscd. This is much the same as Biclat's statement, that the mode of driny may begin at the head, the heart, or the lungs.' The functions of these ormans are, bowever, so mutually deperment umon each othur. that bupamment in the fumetions of one of them may leat to W., while the morle of dying is chicly expessed through the functions of amother.

When a person luses blom to such an extent that loe faints, if the dow of boon be mot arresterl, the state of fanting or symempe contimues, and the heart's action ceases. The canse of I). here is, wot that the lowart is mablle to contract, lat lecanse its natural stimulus, the hoon, dens not enter it in sufficient quantity to excite contraction. This is temmed (b. by anm mir. In wher eases, the stimulas from booml may be sufficient, but the heart may have lost its contractile powe: Such a mome of death is said to be lyy asthenie (tir. want of power). Many lmisons and diseases, the to mombl materials in the blow (as, for exany)le, cholera), frove tatal in this way.

1. may liketrise be pronduced by suxnmsion of the functions of respration, as when aceess of the air to the lungs is impeded, or when the actions of the muscles of respiration cease, in consequener of liscase or mjury of the luan ur spinal coml. The first of these moxies is known as suftination or apmed, and we have exampies of it in crownings, smotherins. claking, stramsulation, \&心. Forcible pressure upin the chost, such as sometimes haldsens in great erowds, or as ucours to workmen partially Turied by the fall of earth. de., will earnse D. in it few minites, if naviement of the lumse is pre. rented by the pressure. Textanus and the puisun of Ebrychmine prove fatal in this way.
i). by coma, or berimming at the lman, is cousud ly ohstruction to the cirenlation thrmesh that organ
 hiloml within the cranmm, or when a portion of lone is depressen in a fractowed aknll) : ly elots of Jlond within the vezsels: hy varinus marentie Inisons, such as minum, alculol in ucessive puatity, candonic achl, \&e.
'Tu these furns of dyins may be whder (acemoling
 in the bloud, such as oecurs in typhomi fovers and in wher disenses of a malignant or pestilntial kinm. $7_{11}$ this case there is complete and womeral prostriation of atl the living puwers. The hiond, the natamel somree uf life to the whule boly, is itself deal, amd spreals reath insteal of life. Aloust simultineouly, the heat luses its power ; the versels, amb
 arsation takesplate in varimes orgas ; the moblullat "hhonenti, from which the chnef mespiratory nowns arisu, is turpol; the purmers of raspiration fatil: volnatary motion is almost suspemend; molacular mutrition reatom and is very rapidly forlomed ly

delirium, closely resembling dreaming, which usually is of a pleasing and cheerful character.

Saw ye not even now a blessed troon
Invite me to a banquet, whose bright faces
Cast thousand beams upon me like the sum?
Kiny Henvy VIII., Act iv. Scene 2.
In dreadful comtrast with snch risions, are those which baunt the dying mimls of others, when it wruld sometimes almost aprear as if the sinner's retribution commenced even on his death-bed.

Dementia or imbecility sometimes comes on shortly before D., aul manifests itself by an incapacity of concentratimg the ifleas upon any ome subject, and liy an almost total failure of memory. The mental wealness is often cxhibited by the pleasure which is alerivel from puerile amnsements. The great dramatist, from whom we have just quoted, notices "playines with flowers' as a token of approaching dissolution. In the form of delirium, ocular spectria seem frequently tolie present, the patient apparently trying to catch some imacimary olject.

There is generally well-marked relaxation and incapacity of the muscular sjstem, and the roice is usually weak anul low as $I$. approaches, often dwimding to a mere whisper. The mode in which the action of the heart declines is rarious; in most diserses of loner stanting, the cessation of the beart's action is gradual, the rate of the pulsations being much increased, hut their energy beine very much impaired. In some acnte affections, the falure is shewn ly the irregularity of the pulse, while the foree is little altered. In ather cases fespecially in cerebral diseases), the heart, irefore fimally ceasing to beat, eontracts violently, and sumbenly stops.

The respiration is sometimes hurried and panting till just before D.. while in other cases it is slow, laborions, and stertorous. 'The acemmulation of nucus, \&e. in the air-passages increases the diffieulty of Dreatling; the sound known as the 'tleatlattle' being proluced hy the passage of the air from the lungs through the thitl collected in the trachea and upier respratory passages.

There is a loss of animal heat, leginning at the extremities. Furfurther information on this subject, we may vefer to the article Peatir in The Cyrloputha of 1 notomy and I Mizisiolog!, from which we have horrowed some of the matter of the preceding puramaphs.

The sigus of artud $D$. may he arranged nuter there hearls: 1 . signs of the extinction of the vital functions: ©. (langes in the tissues; 3. Clanges in the external aprearane of the body:

1. The arrest of the circulation and rospiration wonld at first sight appear to afford ilecisive -vilunce of 1 . ; but these functions, as in the casc of hybermatines animals, may be resheed to sor low a condition thait it is hy no means casy to decute whetler or mot they are rompletely antilhilaterl. In cases of aflerent ilrownins, these functions aro
 like that of colonel Townsend (see any standard Work en madical jurisprabmee) oceasionally ocenr, in which the pationt has the power of voluntarily suspuding these functions for a conswhable periond.

The Lose of imritability in the muscular filmes (a fact which may readily ine asecrtaine loy a galyanic (whrmen) is a sign of far sreater importanee than either the apmarest stopmene of the eireulation or of tha respiration. The contrantility of the skin is also lost aftur duath. conviction on any subject; it is more likely that the judgreat will be run away with by specious orattry. But this proceeds upon a false conception of the great oliject of public D ., which, though it seldum influences the votes on the actual question, serves to justify the proceedings of public men tor their constituents and forms one of the chiof aliments of pullic opinion and of the political lifo uî a community.
DEBE'NTURE. There are two kinds of docnments to which this term is alplied, which may be described separately.
E.crise General D.-This is a certiticate anthorisiug the exporter of certain classes of gronds to receive a Arawlack equal in anomit to the excise duties which had bera paid ou then. The oliject of the document is to certify two things-first. that the "xcise duties had actually been paid; and, second, that ly $a$ certificate from an officer of customs the gooms hail been shipped, and bona fule exported to foreign parts, and not relanded in Great Britain. This kind of D. is executal by an officer of excise (Inland levenue); it is partly printed and partly written on a sheet of stanpel paper, for which the exporter pays. is cuncerns the export of beer, there is an excise D. slightly differing in form.

Railucyy $D$. -This is the term applied to a deed of mortgrge given by a railway company for borrowed moncy. Dy virtue of acts of parliament constituting, and giving additional puwers to, a railway company, the empany is authorisel to horrow a slecified sum (see Captral Accuunt, also lialmats, Legisiation anl dianagement). The deed by which the loan is effected is simple in its appearance and nature. It consists of a sheet of paper duly stamped; and its contents, cmluraced in a singlo prage, are partly printed and partly written. All expenses connectec with it, brokerage inchulded, are borne by the comMany. At the heal of the deed is the name of the railivay company, in large letters, with the words Mortyage, No. - and the amount in figures. It then proceeds: - By virtue and in terms of an act, \&e. [the act or acts being recited], We, the Railway Company, in consideration of the sum of , imill to us hy _, Mortgage the said unlertaking, amn all the tolls and sums of ranney arising hy virtue of the said acts, and all the ustate, right, title, and interest of the company in the same, th hold unto our said assignee, until the suiul sum of - $\qquad$ together with interist for the same, at the rate of -_ for cery humben pronds ly the year, payalle as hereinafter momitimed, he satisfiem. And it is herchy stipulaten that the sail Trincipal sum slall be repayable, amd the said company are leredy bownd to repay the satme on the [here diate of repayment is insertell]. but it the parties hereto shall mutaally think fit, the" same slall thorafter remain as a bans to the sait eompany, for such firther period, and at any vuch rate of interest, as shall be mutually agreced upum ly a minutle indiorsed hireon to that effect, and vichull hys ane une sain assiguce, or
And in respect of the interest to heenne due on the saill prineipal sum at and priur to the said [late of reghyment, the said company shall pay to the bearer of the interest warrants here with issumel. the several suns contained in such wiurimes, at the times therein respectively specificel. In witucss whereof, these presconts wivtem, in su far as mot being pintel, on
 follow the mane of secretary of the railway company, the name of place dith, and the signatures of thry". directhes, with the sighatures of wituesses.] ${ }^{3}$ Such is a mailway delmenture. Along with it are given waranty for the peyment of interest at the periods sperilich, whill ary paid on presentation.

## DEBLAI-DEBT.

These interest-warrants, which are sometimes callow Compons (q.v.), are small slipe of paper bearing the sum, dite, and siguatures. 'llhe olpoct in giving them to the dehenture-hulder is to sive him all trouble. They are pain to any one presention them.

Brief, simple, and ellective, a ralway I., with its accompanying interest-warrants, is periaps the most convenient ded of monthane aver myented. In dow and unequivocal words, it phelges the whole railway for tho loan, and it must neressarly lor redemed before any sharcholder can claim a dividen! from the modertaking - eath 1). ranking acorting to its nomber. Jialway delmotures are, therefore, reekonel is safe form of investment, and are cutrerly taken up ly individuals who have sums of a few handrel pomils to leme for several rears at ir stipulated rate of interest. 'These dehentures possess the further advantage of being saleahle, and throng the agency of stockbrokers they gass from hand to hand. In the ereat of neither interest nor principal being praid, the holder is entitled to cuforce the mortgage; but this must be done by a snit at law in the eompetent court; aul wherever there is litigation, there are means for protraeting a settlement of clams.
w. c.

Denh aI', in Fortification, is any hollow space or excavation in the ground made during the construction of fortifications or siege-works. The cavity itself js the D ., while the carth taken from it is the remblat.

DEBOLAH (Heb, significz a bec), a Ilebrew prophetess, the wife of Lainith, who lived in the time of the Judges. She dwolt in Mount Ephraim. anl uttered her judicial oracles from her tent wider the 1 alm-tree between Bethel and Ramah. To deliver her land from the oppressive yoke of the Canamitus, under which it had gromal for twenty years, D. called to her aid Barak, son of Ahiunam. probably a man of heroic temper. An army was raised among the triles of Napdali and Zebulon, and a battle took place in the plain uf Estrailon, where the Camanitish host was completely monted, and sisera during lis llight, as D. hail predictod, was murdered loy a woman. This victory sceured to the Ismedites a phewe of forty years' duration. The 'Song of Deburah' fas it is generally eallet, though its ermposition is not ascrined to her in the Bonk of ondges) is a clroied fragment of pimitive Hebrew poetry.

DEBOU'ClHNG, in Military Tacties or evohtious, is the marching out uf a borly of troops from a wool, defle, or other confined spot, into "pen ground.

DEIBRECZIN, a large strageling town of Eastern Itungary, situated in the midst of an extensive phan, about lin) miles east of ['sth. Like many of the Hungarian towns, I . is a mere colluction of villages. mitel on no particular plan. The bouses for the most part are mean structures of not more than one story in beight, and the strects, if such they can be called, heing monvel, are exeentingly dirty ; in certain seasons of the year, planks are laid down to enalile passengers to cross. Nutwithstandug its generally squalid character, however, D. is possessed of some very handsome pulbic buildings, including a town-hall, it lrotestant collere, with a staff of 24 professors :und 1800 students, and several churehes. monasteries, and charitable institutions. The inhabitants, who are very industrious, are depentent chiety on agriculume, but a mumber of them are engayted in the manufacture of coarse woollens. sheep-skins, leather, earthen-ware, soap, saltpetre, and tobacco-pipes, which are fanous thronghout Hungary. The cattle and swine markets of B , are among the most extensive in Europe, and its grainmarket is also large. The population of 0 . is usnally
statel at about 60,000 , but the most recent official rethnn, printer at l'ranne in 185\%, gives it at only $1: 3$, , 00 , which, if sorvel, implics momathy repressive measures on than part of Anstria in retaliation for the part it took in the strughle of $1515-1518$. With the excoption of :om日, it indalitimis are all frotestants. They have sulferel ameh on weount of thriv fath, erguctially in 15077 and 1686. D. twok if prominent part in the revolation of 1859 , and was for some months in that ye:ur the seat of the national diet, after it had been foreed to demose from l'esth.

DEBREUTSED, a term peculiar to English heraldry, used to indivate the grievoms restraint of an animal, and its being debarred ${ }^{\prime}$ its natural freedom loy having any of the orlinaries lind over it (Dic. tionary of Display).

Bebruised.

DRE'T, that which one person owes to another, or the duty which, as responsible beings, all owe towards Gond. Life is figuratively spoken of as a lean, and the act of dying is called "pryine the delat of Nature.' Mare commonly, however, the term U. is limited to money legally due and exicible by process of law. To speak in legal phraseology, IV. may originate either in agreement on by opration of law, 10 as a consequence of injury, though in the latter case it more commonly assumes the form of a clam for Damages (q. v.). Liquidated D. (im Scotlanl, liquil), is where the exact amount has heren assertained; contingent $I$, is where the lialifity deponls on the occurence ni an event which may ur may not happen; future $\mathrm{D}_{\text {., }}$ is where the liability is existins, but the time for pryment has not yet arrived. This may, in Scotland, he secured by certain lugal processes, eutitled Arrestment and Adjutieation (q. r.) : bat in Englant there is, in general, no method of athixing a liahility upm 1 moperty before the D . becomes payable, excerit in the case of bankruptey, when a future or comtingent D. may he proved against the estate, as in Scotland. The main division of delits in Scotland, however, is into movable and heritable-the former being in themselves chargeable only uma the dehtor's personal funds, althouch they may, ly certain forms of law, be made also a charge unom his real estate; and the latter leing directly and inmediately a charse uron lis real cstate. The fummer are, acorlingly, estermen as personal estate so tar as regarils succession, while the latter are comsinleren as heritable or real property. In England, also, a D. may be secured on the debter's real estate, as ly mortarage; but th" listinction is less material as regards sucession. fur even mortyages are accomented personal estate in the hamds of the ereditor. In Scotlamel, on the other haml, there is mo distinction corresponding to the funlamental fivision of ilebts in England into simple contract lelats and specialty debts. The fomer are all delots which arise without the intervention of a Dace ( $(\mathrm{q} . \mathrm{v}$.$) , or before$ julgment; and it is only of late years that they have been male: recorerable acainst the heir of the dubtor: Such if 1 , does not by law carry interest. A specialty 1). is me constitutell by Deel ( ( $\mathrm{f} . \mathrm{v}$ ) , or lay is record of court, as a recognisance, or by a julsment of a court. The formur carries interest from its date, and ir judgment 1 . carries interest from the date of the judgment at $\pm$ per cent. It binds all lands of which the defemtant is possessed, either in law or curuity; but to make this effectual against purchasers, the judgment mast have been registered in the Common Pleas, and the registration must be renewad curry five years.

## DEBT.

IDEDT. Action of, in Enchand. This lies for the menvery of is leht in its tedmieal sense, of momey atsertainel in amont due ley one to nother. Where this hats been asectained by a bond tor the ammont. or liy a judgont of a court, aetion of heht is in gencral the only 3 mon $r$ action: but in the casio of the delat arising from breach of contract umin seak, it may generally be sucd for bither by an action of delat or by one of comenant: on where the contract was nut under seal, by an action of delit, ow one of assumpsit. Actions oi hetst, when on contract umler seal, must le lrount within 20 years ; on other eontracts, within six years. The time in both cases is taken from the accruinis of the eanse of action-i.e., the loreach of eontract: but if a sobsequent acknowledgment in writing has been made loy the party liahle, or be has pail the debt im part, or paid interent, the time will run from such subsequentact. In an action of deht, the writ by which it is commenced what be endorsed with a note of the amount of the delt, and of the costs of the writ, and an intimation that, if these are paid within four days, $n$ o further proceed. ings will be taken.

Debt, Natioxal, is the amonnt which any state admits itself to owe to those who mary have adranced money for the use of the govemment on oecasions when its expenditure has exceeded its ordinary income. As in the case of intividual lebtors, who sometimes engage to pay more than they olitain from the lender, the amont of a national delit may not he the amount which the nation has lorrowed : it is often greater, from the necessity of hohling ont to eapitalists. as an inducement to make a large alvance, that they will be set down as areditors for more than they have siven. On the other lame, it may happen. though of rase occurrence on a lave scale, that when momey is buriner low interest, in mation may give its reditors the altemative of recesing payouent, or allowine a deduction from the nominal amont of their dot, and they may chonse the latter as the preferalie alternative. When the term. "the national dent.' is wsel by itself, it is always understenol to refore the that of our own comentry, whele is inden the hensint in the worlh. It anmonts, in round nombers to sot millions of promes. The next in ammant is that of France. That country havins heen entirdy hankupt huring the first lewolntim (sue Assfoxity), ite existint dolet may fie said to date no furla bath than the Comsulate, when arelit was restand. on the dirst return of the Bombons, lefore the hattle of Waterlow, it amumted to le3 millions of pommes; it is men :3:') millims. '?loe next in anmme is that of Russin, estimated at ?es millinms. Anatria Flocely follows, lowire indelted to the extent wi 22b millims: :am, with all its extont :und p"pulation, this sum is slamen to ber heasime lamion on that compire tham nowly fonr times the amomet is on the British, from the cirmmstame that, While ond own finance-minister is ahe to atain whatew funts ans requirel for carying out the mational fullow, Austria is motorionsly restrainom isy want of momy, while lece cevtitors dow mot

 arsan along with the sumemacy of prhannat and the mowonty for as stanlimes army. 'Jhengh the
reigns of the Tulors and the Stuarts, the nation's protection against the power of the como was in the king heing unable to keep ups it standing army. The force he then commanted consisted of the great rassals of the erown and their feudal retainces, called inat to serve for a limited period -ib borly apt to be wilme, aml subject to such flnctuations that it could not be depended on fur contimons warlike onerations. The House of Commons jealonsly checked the rise of a standiner amy, by restricting the means for supproting it. Loms were sometmes obtainel or exacted by the sovereign, lont they were temprary and of comparatively trifling amount, for the Commons would have considererl it an entire saerifice of the means of protecting the national liberties hal they mortgaged to any of these kings the future revone of the comtry, so as to chable him to raise a Inan and lery an army. Bat when the control of yarlinment over the preronative was strengthened, jealonsy in this direction was no lonser necessary. Aceordingly, it was when parliament trimpher in the Revolution settlement that the national delot began. The first regular lom was olitained in 1693 ; it consisted of the eapital of the newly crented Lank of England, amounting to Et $1,200,000$. This accommonation to the government was, in fact, the priee paid by the bank for its privileges. As the mation was engaged in an ex]ensive war, this hegiming was rapully followed M1, and at the prace of Thyswick, in 1697, the natiomal delte exceeded 20 millions. Before the accession of the House of Honover in 1714, it hand exceeded 50 millions, and the rapid rise of this burden was a strong argument in the hamls of the Jacolites arainst the lierolution settlement. Whenever a loan was negotiated by the government, special tums were offeren accordine to circumstaness. In merase, there might lee a terminathe amuits, say of be or 1 of years-that is to say, is cortain preentare hemor faid durine that perion, at the and the nelat was to be extinguished by such payments. Sce Anvivir. In other instanees. there was a perpetnai ammity. In a lonn nerotiated mu the latter terms, that annity was always rather under than ahove what a lorrower would give to a private lember, althomeg such a borrower was homel to repay the mones, while the nation was not. It came to phss, in Fart, throuch one of the mont curims processem in the whole mystery of tinamer, that a loan neter to bepaid was consulend in mone eligible investment than a lom on be repait. The fivmment male this sam- for a distmet ain it was-ly the comvenionet to the paldic, whe, always havines monpy for which they

'live cralitur thas broumes thr abselute master of the lif. and liberty of has debtur and of all those who are deprodent npon him. The arrangements of the Nosac law are an llhastration of the manner in which, is the rader forms of suevety, the laws of
debt thns combine a degree of lenity with a degree of severity which are equally alien to modern views. In this as in many other respects, they are, as Michaelis has pointed out (vol. in. P. 300), a recotuntion of the consuetudinary law of the stage of society to which they belonged, rather than a system special to the Jews. If an Israclite became poor, it was a duty to lend to him, and no interest was to be exacted either in money or in prohuce. If he was a foreinmer, the case was different, and the taking of interest was legal (Lxod. xxii. 25 ; Deat. xxiii. 19, 20; Lev. xxv. 35-35). When the sabbatical year arrivel-i. e., at the end of every seven years- there was a gencral remission of debts as between Israelite and Israelite; and the near approach of the year of remission was not to be recognised as an apology for declining to lend to an indigent brother (Dent. xv, 1-11). Pledges, it is true, might be taken, lut eren here the same humane grinciples prevailed. The upper millstone was sacred, for to take it would be to deprive the debtor of the means of subsistence. If raiment was the pledge, it must be returned before nightfall, when it might be required for a covering; and the wilow's garment could not be taken in pledge (Exod. xxii. 26,27 ). In strange contrast to this is the provision (Lev. xxr. 39) that a poor Israelite may be sold to one possessed of substance, even when moditied by the special provision that he shall serve as a hired serrant, not as a bond-servant, and shall be set at liberty when the year of jubilee arrived. Nichaelis says that the jndicial procedure for debt was quite summary, the most important eauses being decided probably in a single quarter of an hour ; and he remarks that Moses nowhere thinks it necessary to mention how a deht was to be proved before a judge. There was, however, an extensive system of appeal; from the julge over I0, the case was carricd to the julges over 50, 100, and 1000, and finally to Moses himself. As every Israelite was entitled to clain the land of his fathers at the jubilee year, and thus to place matters on the footing on which they were after the settlement in Palestine, debts amil hurdens on land were limited to elaims to the fruits of furty-two harvests; but houses, with the exception of those of the Levites, might he sold in perpetuity (les. xxy. 29, $30,32,33$ ). Children were often given in pledge (Job xxiv. 9), and ultimately into slavery, it 1 byment of debt (ad Kings iv. 1). Snbsequent to the Captivity, the pressure of debts upon the poor lveeame so intolerable, that Nehemiab espoused their eanse, and insisted on a general remission (Nohom. v.), exacting from the rich an oath that they wonlid never afterwards press for bayment. Dehts of the character here alluled to probably rosembled those whiel the recipients of parochal relief in ontr own day owe to the community, rather than dhats in the commereial sense. In Matt. Xviii., thrist refers to the custon of sellinet the debtor, his wife and ehifrem, and all that lie hat, in payment, rather as a moneral enstom of all natioms, than as one peenliar to the bews-tho 'crrtan kiner' huing a typical instaner of a man of substamer.

Both in Grecce (Plat. Vita sulonis 15) and in
 hatul :c claim to the persme of the dehtor. l'pevious to the time of solon, this arranemont had brotneed consedmences at Athoms mosely antogens to those which afterwards lod tw, the strugeles between thu patricians and pleprians at Jome; and his alulition of it forms ano of Sulon's many cratims t." Hre whacter of an "nlightemed legislator.

 jufarment jumbumex agianst hime for it, thirty
days should be allowed him for payment. At the expiration of that period, he was liable to be given into the hands of his ereditor, who lrept him sixty days in chains, exposing him from time to time pulidicly, and proclaiming his debt. If no one sterped in to release him, the debtor at the end of that time might be sold for a slave, or put to death. If there were several creditors, the letter of the law permitterl them to cut their debtor in pieces, shariner him in proportion to their claims: but Crellius tells $11 s$ that no shylock ever was fouml at Ifome. To treat him as a slave, however, and make him work out the deht, was the common practice: and the children in his power, in accorlance with the whole ennstitution of society at Rome, followed his condition. The lex Potelia (326 m. alleviated the condition of the debtors (nexi) to the extent, at least, of preventing summary imprisoument, and relieving all delitors, for the future, from being put in chains. There do not seem to have been any pmblic prisons for debtors at Rome, and each creditor, conserpently, was the jailer of his own debtor. In this circumstance we probably see the reason of the prominence which was given by the plebeians to a change in the laws of dehtor and ereditor, on the oecasion of their tirst secession, in $49.1 \mathrm{~B}, \mathrm{C}$; ancl subsequently dring the whole course of the struggles between the two orders. Whatever We may think of the policy of limiting the rate of interest, as was afterwards done by the laws of Licinins, and had previously heen done by those of Solon at Athens, there can be but one opinion in morlern times as to the propriety of abolishing the right of private imprisomuent.

Duing the fendal period, the person in geneval was not attachable for delot, imprisonment being ineonsistent with the duties of warlike service, to which every man was homnd and it was for the encouragement of commerce, and in consideration of the merchant having to deal with strangers and foreigners, that it was first introduced by the mereantile commmities of Europe (Bell's Commen. taries, Shaw's ed. ii. 1' 1067). By the statute of Merchants, it was enacted, at Acton Burnel, in 1282 , that in lending money, a merchant might bring the borrower before the lord mayor of London, or the chief warden of another good town. and cause him to acknowledge his debt and day of payment. A recognisance was then enrolled, and an obligation written by the elerk, and sealed with the king's seal and the debtor's. Failing payment, the creditor was entitleal to produce this obligation, and to demand a warrant to seize the person of his debtor, aml to commit him to the Tower. 'The history of thr law of imprisonment for debe in this conutry is staterl with great clearness by Mr Bell in the section of his Commentories to which we have just refervil. lunt it is impossuble to cmullonse it within the limits of tho fresent article. Further information on the subject will be fonnd unter

 the prisons uf this manstry were crowded with elehtors. It was nsermainat ley parliamentary roturns, flat in the is months subsequent to the commorcial fanice of 182.5 , 101,000 writs for debto were issumbliom tha English rourts. In the year
 sent toprison in Lomdon, and on that day, 545 of thess wole still in combinemunt. On lst Jimmary

 which the standard mut is divilem inti tenths, hundredths, de. fur the hemominations helow it, and multiplied by 10, L10, dew, for those : whove it. The mature of this ne then of division will le hest explainal hy an cannule fom the french systm, where it has lawn must rimully varion wat. '1"he mitre $(=: 3 y \%$ Enalish inchas is the mat of lenath, and the foundation of the whole system. Fur the himber hemomations of laneth, the licels womds

The latn words thit, cinti, milli, on the other
 and thas fumish names for the lower denominations; dicimiter - $\frac{1}{11}$ of is metre, contimetre $=\frac{1}{105}$ of $:$ metre, de. Amilarly with money; the frunc bein. the unit. a decime is the tenth part of a frane; and ar montion, the humbedth part.
In rezarel to money, the decimal division is now adopted in many countries. belgium, switzerland,
and Piedmont have adopted both the French frane as tlie standard unit and the division into tenths. In Limbarrly, the lire is divided into 100 contesimi: the Loman seulo is livilud into 10 puoli, and the raolo into 10 bojocki: the Dutch gulden, into 100 vonts; the linssian rulle, into 100 kopels: and in Ameriea, China, ant Japan, the dollur, into 100 rents.

This phan of decimal rantation in weinhts, and measures is the only ratinna? rne, becanse it is in accordance with the miversally adopted decimal notation. If thoroughly carried ont, the facilitios it would afforl in every department of life are scareely calculalile. For one thimg it is not too mach to say that me-half the time now slent in Creat Britain in learuing arithmetic might be saved. That sturly might, in adulion, be male an effective means of intellectual discipline; whereas at presunt the time must be spent in acquiring sometling like a reauty lut blind application of compheaten rulus.

The most stribimg instance, Ierlapes, of the incomvenience of the afnitrary mote of division is furnished by the thermometer. In this case, natire has lixed the fumbamental measure, and made it the same for all nations- the interval, mamely, hetween the freezing and loiling Imints of water. And yet, in Enefand, this space is dividen into 150 parts or legrees; in fiemany and the contiment generally. into $80^{\circ}$; and only in France las it leen divileal into $100^{\circ}$. 'Flus, the basis of miformity made to wu hand has heen thrown away, and every olsservation of temperature mane in one conntry las to lie painfully translated before it ean be milerstood in another.
1)ECIMATLON, a military pmishment, rarely intlicter in the present rlay. Wheen a eonsiderable hody of troops committal some gave military attence, which would be pumishem with death if committel by an intivislual, the pmonshment was awarded to me-tenth of tlem lyy lot. instead of to the whole nmmber, in ornter that the army might wot tre tow much werlkenerl.

DE'ClMII, in Music, is an interval of ten cliatonic dourees, as from C to L , ur third anove thenctave, as which it is always treated in hamony: Thure are moly two cases in which it is treated diterently from the third: 1st, in lowlile comerpmint. where a meecsary difference must be manle althoun the same harmonic rules apuly; and id, in thoromirhhass, where the figure 9 shall rise in theree to 10 , insteal of falling a degree tos.

DECK is a nearly that planked covering to a ship, forming a flooring to the persons above it, ame $n$ shelter to thuse below it. There may be sereral sich in a ship, we under another; not only does bach serve the purposes here named, but it helps to strengthen the vessel, hy lulug the siles together. In ships of war, the nimber of decks varies with the rate or size. First and scoond rates have three whole deeks, stretching throughout from stem to stern; besiles two partial decks called the formcristle and the futurter deck. The space between these two lartial leeks, which renders the niper D. open to the sliy, forms the waist of the ship. Smaller shits have two whole and one half lecks; while a still smaller class have moly one of each.

Where there are several decks in a ship, they are - listimenisherl by different manes. Thus, the quartio D. strutches over that part of the upler D. which extemls from the stem to the gangway. The upper or main D . has just been alverted to. The midulle or scond $D$. is next muler the man $D$., and is rather thiclier and stronger. The lower or first D. is in the lroaxlest part of the ship, and is made very stroug, to receive tho heaviest guns. The orlop D. is the lowest of all. and is often only temporary ; it is elictly oceupied as sture-roons. Some of the above are wanting in all but the largest ships ; and other names are occasionally sulustitutel.

## DECKANEE' IEMP. See Mibisces.

DE'ciker, Sir Matmiew, BAR'T, a pubitical economist. was lom at Amsterdam towarls the close of the 17 tl century. He came to Lonton in 1702 , was natirnlisal as an English subject in the following year, and having emburked in commerce, attained the greatest suceess; received a baronetey in 1716 , and three years afterwards, tiok his seat in parliament as meniber for Bishop's Castle. ILe sat in the Honse, however, only for fonr years. His lipath took place Marelı 1S, 1749; the baronetey then becrme extinct, and his daurhters succeeded to his estates.
D., in $174 \%$, mhlished a pamphlot, wheh in twelve Pars ran thromen seven editions, in which be propused to raise all the public supplies from one single tax-namely, a tax upon houses. Aceorling to J.'s calculation, thare were then in Englamb, exelusive of Wiales, $1,200.000$ honses; of these lee meant to tax muly me-lialf, comatinur ofl 500, mote as iuhaliterl hy the worleing-classes, and loo.000) as leeing mimhalited. liy this moans, he proposed to raise an anmad revenue of thomm, omo, which sum was
 ment of that day sequired. 'I'he surplas was to
 disdlaterives duht.
 lomdly, lumee tor exomisp man's self in rhatorical (1.livery), is the art of spealsing acombing to rutes, whereby the sinuse of the worls, as well as the forlins and sentimmat, is maturally and elaracteristially repossonterl. limojtation, tharefore, whether gulan or smos, is suljuel to the laws of 11 ., from which it derves its vollu" and simnticance. Perfixt 1). imphes cerrudnus of sprecth, distinctness
 1). is therefore eleaty of it musieal nature. In musia. howarar, ly, is su far eliferent from the 11. of mpalkines that the simer must athere to what the "omprose" has writion, as it is tho later who lixes the whole of the intumation, modnation, and
phrasing, and also the fompri and expressiom, ant? who not mfreguently satrifiees the correetness of the D. to the cham of some peraliar meludic phate of pleasing rhythm, or a vocal musical (rabellishment. The truth and beanty of enrmet musieal I), are always endangered ly is translation of the ericinal worls into another languan, a work which, with the greatest care and ability, it is in many eases almost impossible to acemmplish word for werd, or sylliblle for syllable su as to fit acomately tor the wecent of the musio. The mastereworke of many
 which our mosical fublis seem yuite inhalioment, while listening to translations of "heras so aralessly exocuted as to destroy their rrationt beantios, and freruently altogether $t_{0}$ disturt the sentinent. In ewher times, ats well as now. considerable tronlale lais heen taken to estahlish I). as at seience. The ancients had a lind of note, or sign of intonation, Which they phaced over or umber the words, possibly to decide whether the accent should be given by a high or by a low tone, and thus to reguate the morlulation of the voice. That the thatrical II. of the ancients resembled the musical recitative of the present day, is generally admitted. In the lierman language, there are numerons works written on the art of declamation.

DECLARA'TION, in Common Law, the prading in which the plaintiff in an action at law suts forth his case against the defendant. The plaintill may declare as soon as the defendant bas made aprearanco in answer to the Writ of Summons (1. v.), or, where the summons is not specially indorsed ( $I$. v.), on failure of the defendant to make appearance. If the plaintiff fails to deelare within a certain tim", the defendant may obtain julgment of Ton Pros. ( 1. v.) ; and if the failure continue for a year after the writ of summons is returnable, the plaintill is decmed ont of court. On appication to a judec, a plaintiff, if not prepared, may obtain time to declare; and a defective D. may be amenderl. The D. manst be entitled on the face of it of the froper comet, and of the day, month, and year in which it is pleadecd, and bears the Vente ( $q . v$ ) in the margin. In the name and number of the partics, ann in the chavac. ter in which they sue of are smed, the D. must eorrespond with the writ of summons. The 1. states suceinctly in one or more counts, each count ingeneral satting forth a separate cause of action, the frets of the plaintiff's case, for which he claims redress. Any irrelevant matter will le struck ont at the cost of the plaintili. In case aplearance has heen made for the defendant, the D . will he relivered to him or his attorney. If no appearance has heen made, the paintiff may proceed to obtain judgment hy defalt. See Jedrivest, Defaclet, Pleidino.

DECLARATION, in lien of an oath. Quakers, Moravians, and Separatists, who object to swear on religious gronnds, bave been frmitted ly several statutes to substitute a simple D., or affirmation, as it is called, for an wath, sue iffrmation. the members of all other Christian sects may still be compelled to swerr, whatever he their scruples, in criminal cases. But as regards civil cases, it was enacted hy the Common Law Procediure Act of 1551 ( 17 and IS Vict. c. $125, s, 20)$, thit any jerson who shombl dechare that the taking of an oath is, according to his religions helief, unlawful, shomld he entitlel to substitute an affomation, or $\mathrm{D}_{\text {. , and that persons }}$ making a false atfirmation should be subject to the same punishment as for perjury. In the following year (1855), these provisions were extended to scotland by 18 Vict. c. 25, s. 1 ; and by s. 2 , the gaeen is mpowered, by an uriler in commil, to direet the provisions of the act to be applied to all courts in

Acotlind; ly which wondel semen tri be meant all eourts othor than the 'eronts of civil jurlicature' montinned in the lirst sectun, i. c.. to all criminal comits.

 whas len's not survive the trial. Sial alaclarations are uf pectiar value for the ants uf justire whome the party conittine 1 lirm ding of injorions whicla inv

 of the crimb is alwass antmittot as avidene ain the trial of the prisoner, powidoll that it was delifut. atcoly cmittad while the deceasch was in prossussion of his faculties, and that it is prosed by camindo witnesses. If it be possible, the dyinfe i). shomk almays be committed to writime and tested in the must complete manner that is consistont with tho circumstances in which it is emitted. In eases rif necessity, lowerer, it may be proved by parme eridence. As to the other cases in which secrandiry or learsay evirlence is admissible, sue Evidezeli.

DECLAIATION IN CRININAI JIO. CEEDINGS. In Scotland, the statement manla lyy the prisomer lofore the magistrate (see srane. MENT) is called his declaration. It is the duty of the magistrate to take this D. immediately on the prisoner leing larought to him-that is to say. if he is in his sober senses. The masistrate must previously inform him that it is entirely at his own ortion to declare or not, lut that if lie chonses to dectare, the 5 . may be used in exidence arrainst lim on his trial. In practice, the examination is generally conductal by the procuratimetiscal, who knows more of the facts of the case than the pre siding magistrate. It is taken down hy the clerk of comrt, the maristrate usually dictatiner to lim the form of worls which he conceives will most accurately convey the meanimg of the prisoner, in case of his statement being of such a ramblines description as to renke the writing down of the very words impossible. The D. ourht to contain the name, are, and desicnation of the mrisonor, the parish anel comety in which the crime is saisl to have leen committerl, and all simila partiondars. When completed, it mist be read fiver to the prisuncr, who, if he is alle to woite, signs every lage of it along with the magistrate. If les camnot 61 will not write, the magistrate sicmes it in las stead. There must, moreover, lie two witncsses fresent, who shall sign the In, mul who, if necessary, com speak to the mamer in which it was taken. If the prisoner does not inderstand Furlish, at strorn intripreter mast be emplaged. The [ will le inconapetent to be prollucidy as evin? the magistrate has deliratod the duty of taking it to his clerk, or to any one not a mangrazate. As the D. is not emitted on oath, it will not le allowed to be prodned or need for the purpose of criminatins any one else whom the misotwer may have named as a participator in his crime.

DECLARATION OH MIGIIT. See Rigits.
DECLANATOR, a form of aetion in the Court of session in sootlanel, the object of which is judicially to ascertam a fact, leavine its legal consequmenes to follow as a matter of course. such are declarators of lroperty, of contravention under an irritancy in an Entail (q. $\because$ ) of non-entry, of marriaum of bastariy, and many uthers. The declaratory concluswus if such actions are generally followed by petitory or possessory ones, for this purpose of giving eflect to the right declared; but

## DECLENSION-DECLINATION NEEDLE.

the is by morns necessarily so. A substantial interest on the part of the pursuce must, however, in all cascs be shewr, as it is not competent to ask the court to declare a more alistract fact or right. The existence of this special fonm of action hats contributed th dilfuse in sootlant a false riew astuthe mature uf actions anl judicial proceedincs generally: fiom which many even eminent lawyers have not lisen frec. It is sail that deorees nim actions properly declaratiny confer no new richt, but only declare that a rifht exists in the pursuer,' as if in this case they were an exception to decrees in reneral, whereas it is ribvins that nu decree can confer a new right on the pursuer, otherwise than loy committing an act of injustice arainst the defender. In Euglaud, there are no ations of I, an arrancment often wondered at in sootland, hat in which the Enghish seems to loe more loyical than the sentch law, inasmuch as all actions are actions of eleclarator.
DECLENSION, a grammatical torm applied to the system of moulifations called casta, which nomes, pronoums, and adjectives undergo in many larguages. How the worls Jeclension (Lat, detinativ, a declining, or learing away) and Case (Lat. coster, a fall) cane to le aprlied to this species of inflection, has never bern male altarethor clear. The relations in which one thine stands to other thincs may be expressol in either of two ways. Some languages make use of selarate worls, callet prepositions: in others, the relations are expressent ly changes in the termination of the nane of the thing. Thus, in Latin, rey beine the rout ir crude form of the word for 'ling? regs, on rax, is the word in the mominative case, signifying 'a laing' as sntbject or acent; mpis, in the remitive case, 'of a king;' regi, in the dative, 'to a king, \&c. An aljective juincel to a mom, nsually takes a correspontins change. The number of cases is very dillerent in different langrages. The further we go back in the history of the IndoEuropean languages, the richer fo we find them in these modifications. Samecrit hal cisht cases, Latin six, and Greek hive. The names of the Latin cases, whel are often nsed also in regard to the English language, are-the Nomiuative, which mames the subject or actor; the Genitive, expressinf the source whener something proceeds, or to which it belongs: the Hative, that to which sone thing is given, or for which it is clone; the Accusation, the olject towarts which an action is directel; the Vocation, the purson audressen or called; and the Andative, that from which somethines is taken. The direck has no Allative case. The sanserit, in adution to the Latin cases, has an Instmmentad case, and a Locative case. The erammar of tha inforetine lamonases is complicaterliy the circumstance, that ail numbs don form the of cises in the same way. This makn's it nevconary to fistrilmte moms intu varime Classers, calleal "alechensions,' In Latim, is many as dive declensions are usially given. Sin. ] xemerios. As we hesemb the stream of then, the case-cnding
 are used in their stanh. The limenarne desectment

 almat as momerons and furplexing as thase of dan Latio. (bromem is still to ar ereat extent cnemm-
 difiownt fron tha moninativ- - namely, the gemitive,
 mane (!. v.) has hern more persistent than that of nomas and adjectives, bangages of the thelu-
 casis. in limnish, noms have fittecen cases. Thus,

Kartu, is hear; lorken, of a bear; kerthmu, as a lear; karhutta, without bear; kurhusso, in the bear; kertustu, ont of the bear, \&c. In the Dlasyur, twenty cases may lee reckoned; and the languares of the North American Indians are richer stillperhap's we shoull say, more cmbarrassed. Wlat case-cndines and other inflectional terminations were in their orisin, as well as the comparative merits of the lighly inflected and the analytic languarges, will be considerul under Inflectiox.

DECLINA'TION. If a sreat circle be drawn throngh the pele of the heavens and any star, the 1 . of the stive is the portion of the circle interceptell letween the star and the equator. See l'ole The place of a point in the heavens is determincal loy its right ascension and D., just as a point in the eartli's surface is determined by its latitude and longitnde.

DECLINATION NEEDLE. When a magnetic needle is suspmlerl or made to rest on a point so as to lie free to move in a lorizontal plane, it finds ita prition of rest in a line juming two lixed points on the horizon: and when made to leave that position. after several oscillations, it returns to it again. At certaia llaces on the earth's surface, these two points are the north and sonth pints of the horizon; lut semerally, thongh near, they do not concile with these. I vertical plane passing through the points on the horizon indicated ly the needle, is called the magnetic meritian, in the same way that a similar plane, passing through the north and sonth points, is known as the astronomical meridian of the phace. The angle between the magnetic and astronomical meridians is termed the declination or variation of

the neerle. Thus if NS (fig. 1) We the line of the astrommical merinian, and us the line foining the imbes of the needle, the angle NO, tim. The declination is cast or west according as the maguctic nurth lies cast or west of the trae north. Instruments for determining masnetic acclination are called declination newlles or dedinemeters. In this instrument there are two thincs essential-the mems of awertainims the astromomical meridian, and a nemple for shewing the matertie morilian. Fig. : represents a comman form of the declinometer. Ljom in tripnl pmosionk with levelling screws stands the pillar ]', which is dixerl the grathated

 A lev! 1 a is allon lumg on the axis of the teleseope, for adjustine the matrument. Inside the compasslow is another grahated circle $\mathrm{F}^{\circ}$, the line joining the zoro-ponts of which is parallel to the axis of tho
telescope. All the fittings and in have in imper, from, of comose, heine manitahla. It will la daily

Fig. $\quad \therefore$
as one piece on an axis passing through the centre of the azimuthal circle. When an observation is made, the telescope is pointed to a star whose position with regard to the astronomical meridian is known at the time of observation. The telescope with the compass-box is then brought the proper number of degrees on the azimuthal circle, mail its axis is in the meridian of the place. If, when the telescope is in this position, the north end of the mede stand at the zeropoint of the inner circle, the declination would he $0^{\circ}$; lat if it he east en west of this point, the declination is shewn lay the degree at whim the nemble stands. It is liftieult to construct a needle so that the line joining its pans exactly cementers with the line joining its visible extremities. If this competence be not perfect. the enomatrical axis of the merle accordires to which the readings is mane hes to the right or left of the magnetic axis, and consempently of the the readings. To rom ely this, the berle is somali that it can rest either omits Lower ur amer surface, In timing the tho- reading, the position of the needle is marked, and then it is themed upside down, and again marked, the man of the two row lings giving the true one. This is easily seen in fir. 2 . The declamation of the med lo may he also ascertained by the ' Dipping Needle (4]. Y.). The ordinary compass which lust be used by making allowance for declination, is a declination complies. See Magnetism, Terrestrial.

DECLINA'TUTEL, ia Botch Law, a meliminary plea declinime the jurisdiction of the judge, either on the gromil of his being interested in the suit. on of the case being beyond his province. In England. it is spoken of as a plea to the jurisdiction on the ground of interest, \&ec.
1)ECOCTION is the term applied in pharmacy to the solution procured $l y$ boiling an organic substance with water.

HEOOLORIMETER is an instrument for determining the power of portions of lome black or animal charcoal to abstract colouring matter. Fec Bonk -Black.

DECOMPOSITION is a term employed in chemistry to signify the separation of more simple substances from a compound. Thus, when the red oxide of mercury ( Hg O ) is heated, it sutlers D , and is resolved into mercury $(\mathrm{Hg}$ ) and oxygen $(0)$; and water (HO), when subjected to a current of voltaic
 wagon (o)
 Contustime.
 Theine the wins of the dir et there Ealwarls, from

 and womerbat later in scotland, and comsequatily
 what is called the 11. A. in England. belongs for the most part, th the brimming, am e those in scotland, far the most prat, to thermel of the lith century. The decorated style arose so gradually out of the style which presented it. and mores sh eramally into that which followed it, that it is not wonderful that different prions of duration should le assigned to it by different writers. The honest, probably, is that mentimel by Briton, from 1972 to I46I; and the shortest by hickman, from 1307 to 1392. In fixing on the middle of the 1 fth c. as its highest point, how er, they are all pretty much agreed. and the same agreement is exhithted in reengising it as the must perfect of the Gothic styles. The decorated was a higher development of the early English style, all the peculiarities of which, both in its forms and in its adornments, it exhibited in greater perfection and richness; and it is remarkable that when we pass from it to the more elaborately florid style which succeeded it, the degeneracy in sculpture is as lerevptible as in architecture. It seems, indeed, is if the school of art which we regard as the peculiar production of the middle age, then attained, in all its branches, to a point which admitted of mo mother prowess in that direction. Nor is this remark confine to art. as ahlreasel to the "ye, for that it applies "dually to poetry will he at once admitted, when it is remminemen that the era which we have assimad to the decorated style throws it almost matirdy within the $p^{n}$ ron which is covered li the lome hoo: of Chanter. It is a striking instance, moreover of the intimate relation whirl subsists letwean the asthenic and the general life of a nation, that at was at this very same period that the social. political, and religious institutions of medieval life culmimated. ' 'lisualry and modality were in the folmess of their visor, ant the chardin hat moly just laymen to give emphement to the inmoratiner minds of the first reformers. of all the epithets which have been employed to characterise this style alsohate Gothic, mme (rothice complete benthic. and the like -that of the 'middle mint mi.' is. DECRE'TALS. The borly of the canon law consists, 1st, of the Decretalinm, a collection made by (Gratian, a Fenedictine mouk, after the middle of the $1=$ th $c$., in imitation of the Poman Pandeets, and brawn from the opinions of the Fathers, popes, and clmell-councils ; $2 d$, of the Decretalia, collected by I'ope Gregory IX, nearly a century later, from the decretal rescripts or episties of the popes, as the cotle of Justimion was from the constitutions of the cmilerors. To these, additions were made by several smeecting popes. See Canon Law.

DEDU'CTION is a particular kind of reasoning or inference. In ordinary linguage, to deduee means tos trace one thing to another as its canse, to shew that one proposition follows from some other proposition or propositions. In logic, its signification is more defimite. It is usmal to oppose Deduction to Inluction (q.v.), and to say that the latter consists in reasoning from particulirs to generals, the former in reasoning from genmals to particulars. In fact, however, every step in a deduction is also an induc. tion. The seteral steps of a train of detnetive reasoning consist of Syllogisms (q.v.), and the major proposition of a syllogism is an induction, or a general proposition expressing the result of a previons induction. The whole ohject of this kind of reasoning is to shew that some particular case or Whenomenon really has the marks which bring it maler the elass to which the general proposition was meant to apply. Thus, the equality of the angles at the base of an isoscelos triangle is deduced from the general proposition, 'That magnitudes Which can le applied to one another so as to coincide are equal,' by shewing that the angles in rurstion ean he so applied.

Deduction is more properly opposed to Experiment. Suppose the question to he as to the ralation lectween the spaces and times in falling bodies, the point may be determined in two ways. We may institute experiments, and observe how far bodies do fall in different times, and conelnte a general proposition from the particular instances we observed; or we may lring the ease mader two general principles already established, those, namely, expressed in the tirst law of motion, and in the nature of gravity as a moving force, and calculate from these how far lomies arill or must fall in given times. The conclusion or law arrived at in both eases is the same; but in the one case it is experimental, in the other detuctive. It is the teudeney of all seiences to become more and more deluctive. Knowledge put ma a deluetive bosis is sometines spoken of as scionce, pere ercellense and the immediate results of alservation as empuricism. Nathematies is essentially in deduetive science, amd most of the truths in natural philosophy have hem gratually put on sumbar gromml. Chomistar remains alnost wholly. experimontal; it can prefiet or Idace little or nothing regariong an untrioul case, excopt, fritaps, the propertion in which two lowlies will combine. See lieasuntis:
D) H , the name of two rivers in Seotlant. Tho laver anl mane important rises in five wolls fomo fect almo the seat, mear the top of liraeriach Nomotain, in the merhbumbom of Caintonl and Dem Niwellhi, :3 miles north-west of Gastleton of bramar. After flowing l: miles south-south-rast,

After this it runs east. morth-ewsi thromph Alereleenshure and a small part of Kinemrdineshire, and ends in the derman Ocean at the harbour of Aberdeen. In this course, 96 miles in all, it receives a number of tributaries-the
lai, Nuic, Fengh, dee. The hasin of the Dee, which is about lofo spmare miles in anes, comsists of kranite and gneiss in bearly empal arras. In the queiss ocent many bals of mintive lans: stone, and some natssen of trat-rack and serpentin. On the Dee are balmanal fiathe and soreral villages much resorted to int amman ('itstheton of Bramar, Ballater, Alnym, Kincardinc U'Noil, Banchory-Ternan, amil C'ults. The suil on the bae is light and samby, and ropuires much ram. is railway extends up theside for : $\mathrm{ja}_{2}$ milug, from
 -The smaller Dee rises in kirkemblingtshire, near the morthem bommery of that eonuty. Ita goneral direction for the first do miles is sonthcasterly, after which it hows west to the solway loirth, into which it falls at Kinkedlomint Bay. 'ihne 1). divides kirkendright into two nearly equal portions, and nar the centre of the comnty it expmins to about the acerage breath of a quarter of a mile, preserving this apearance for alout 10 miles of its course, and furminer succes sively loch Ken, loch lee, and lonit Luch. It is aront 50 miles in length, and is navigable for the last 7 miles. The waters of the D. are noted for their salnon, which are of a darker hue, and are fatter than those of most rivers in the suath of Scotland.

DEE, a river in Lughand, draining parts of the shires of Merioncth, Denbigh, Flint, aul Sialop, in Wales, and the west of Cheshire. Near 'lrevor, it is crossed by the Nillesmere Comal, on an apmeduct 1007 feet long and 120 high; and also by the stone viarluct of the Chester and Shrewshury Rail way, of 19 arches, each 90 feet span, and lou feet high. Below Trevor, the 1). wimds first southeast, and then north-east, and north to Chester, which city it nearly encircles. It ('hester, it is 100 yards broad, and runs alongide marshes in an artificial tidal camal 9 miles lome and admitting ships of 600 tons. It ends in the frish Sea, in a tidal estnary! miles lons and 3 to 0 miles lomad, and forming at high water a nolle arm of the sea; but at low water a dreary waste of sand and ooze, with the riber flowing through it in a narrow stream. Its whole cunse is 80 mibes long, and it. elief tributaries are the Trevergn, Alwen, Ceiros, Clyweddog, and Alyn. Its Mper lasin rhieily consists of Silurian strata, and its bower of now icd sandstone. Canals comect the J). with the rivers of Central Englaml. 'Jhe ancient Britons hold its waters sticred.

DEE, Jowr, a celehrated astrologer and mathematician, was the son of liowlat Dee, 'gentlemansewer' to Hemry VIH., born in London 1Bth July 1.i27, and cducated at St John's College, Camhrina. Ifter residing for some time at the miversity of Lousain, he went in 1500 to Paris, where, at the College of liheims, he real lectures on the Elements of Euclid with very great success. In 155:, he returned to England, was presentel by Cecil to Edward VI., and pensioned; lut durine the reign of the 'Blooly Mary' he nearly lust his life. He again set out for the contiment in 15bt. ustensibly for the jurpuse of presenting to the Eniperor Maximilian a hook which he had previonsly dedieated to bim. Lilly, however, in his Memoirs (f. 294), allirms that be aeted as Queen Wizabeth's 'intelligencer' or spy; and this theory is probally the true one. Lilly says that he was 'a realy-witted man, quick of apprehension . . . . and excellent in all kinds of learning;' while the professional mask which he wore, the pretensions he made of leing able to raise and conserse with spirits, served to prevent all suspicion.

DEER-STALKIN: is the art of followine the red ther by cantions mamavringe for the pmpmse of shouting it with the rifle ; and ay promed in the Highlands of Seotand, is forhaps ummalluel as a sport in fatigne as wrll as mexritement. 'Thu" extensive tracts of hill-kme owe which dow mam, and on which thoy are stallan, ar" tamal blece forests, fow of which, howe wer. motwithataming the appellation, can buast of a single tree; :und where these "forusts' burnor to mollemen and others jeche liarly aldected to the sport, deur are strietly prescrumb, to the alnost that exelosion of whem anm? cattle. 'lhis spurt is more hiphly estemed, and greater sums are pail for it hy its invones tham for thy other in Noothand. This arises chedly fran two rainses: 1st, from the intense excitemment oceasioned in the pursuit of the red deer; and wid, from the <ombarative searecness of guon forests. Deerstalking demands many expensive accessuriea, amone which may be mintimed deer-lownis, ti pursue aml bring to hay wounded game; one or more grides to aceompany the stalkrr; and hill-men to drim the deer, when that mpthon of ohtainmes shots is dotermined upon, \&e. However excelBut a marksman the deer-stalker may be, and thouch he may he tolerably conversant with the general 'lie' and bearing of the gromm, he is almost always accompanied by an experiencel suide, noon whose cool juigment, keen eve, and thomough knowledge of every knoll and rock of the 'forest,' depends greatly his chance of obtainines a shot A dress resembling in colour as nearly as lussible that of the groum to be gone over: a rille of first rate make, and previously jractised with at various distances; a deer-homd or more, that wateh comstantly in perfect silence for the slinhtust look or sign from their master: a rubust constitution, to stand the fatigne of walking, cronchin! (som,times in water), crawling or alvancing on the back, fect dirst, are some of the absolnte requisites the decrstalker must possess. And when we add to these the most minfincling persoverance and untiring patience, we have not sail all, for moless he is gifted by mature or experience with nerve ts take instant and careful advantage of the rare mportumities a day's stalk may ollore, his previous care and toil must wn for nothines. The ruttion season commences in Octuler, when the harts are of course useless, hat yehl on harm himes may be shot, and are in shout combition. This sport depends more upm the vicissitules of wind and wather than ferthas ang other, Heer are gifter with rery keen scent, a funt of which the stalker is well aware, and for which he mast allow by adrancing upon his game up the wind. They are also far-sighted, and excedingly prone to take alarm ant the slightest somul, taculties which wam the stalker never to let himedif or his attemdant be seen, and to observe the strictest silence. Heer, if disturbed, for the most part look for the canse as proceeding from the low grounds, and rarely from ahowe; this preculiarity is duly taken alvantage of hy the sportsman, who accordingly aivaners umn his game, wind permittins (frequently loy the most circuituns and preepiptons paths), dou'n hill. When thus approaching deer that are feedng in the valley below, the ntmost cantion is requisite, both is regards speed and the monle of progrossion. The stilker mast alvance inch hy inch on his back, ly restmp himself on his cllows, and drawing himselit forward ly his heels; he must observe every motion of the dear, stapring when they stol ferling,
and retamina lis pesition, irksom thongh it wa, till his game rewnmence prasturines; he mast mever, evall for ma instant, diaphay the sliphenst musual
 chel must sulanit maphatly to erory sinnal and whisper fomb him publes. lourine pentracted stallos, "sumally when the nature of the gromad bew an
 stalker's pathene is tued to tha atmost loy his

 directly thwards the deer, at for sume int remime landl ar rock where a hetle rataxation of hamb:and brathone tme may lwo whamed, we tirine Thas, if fortumate in priperly wimbing the decr, and if the stalk has lwen sucessfinlly arcomphashen, the
 game may lossibly consist of eithor at single sta. or some hinels and one or two stags; the finest 1 the latter is usuaily the aim of the true stallow, and the most deadly spot to aim at is hehind the shoulder. If mortally hit, the animal frempently bounds away for twenty or more yards, and then falls dead; if not mortally struk, it will same times fall at the shot, and spring up again, and follow tha, retreating herd. It is then the deer-hemed is slinget. When a ther is killed, and camot be immediately enveged home, the attendant instantly disenbowels it, that the venison may wot lee tainted. Thrs operation is termed gralloching. 'The best stay in the herd is that which is the fattest, amblas the tinest antlers. See Defr. When there are more than ane sjortsman, or where the peculiarities of the ground are such as to remler the task of stalking umsually difficult, hill-men are employed to drive the deer towards certain passes, hehinil which the shonters are pevionsly concealed. On such weansions, the excitment proxuced by the radually approachings and msuspecting heri, mincled with the grambur of the whole scene, as they at lencth rush thromgh the fatal pass, is enoush to try the nerves even of the most experienced stalkers. The Black Monut, Ielonging to the Marquis of Preadal. banc, is the fimest deer-forest in scotlanl, and extemis for upwarls of twenty miles. The lust work we know of on the sulyect of deer-stalking is scrope's treatise, published in $1533 ; 31$ enlit. 1447.

DHERSTEA LING. by 7 and 8 (ieo. IV c. 89, s. 0 , it is enacted that any person who shall maliwfully hut, snave, or earry away, kill or womd any deer liept in the enclosed jart of a park, chase or other condosure, shall bo guilty of felong, amal shall $x_{x}$ liable to be punished in the same manmer as in the ease of simple larceny. Defeasance of executory interests may le made at any time after the creation of the estate to which it refers. It must be made with the same formalities as those which createl the estate, and hotween the same parties or their representatives.
IDFEESDEL OF THE FAITH, a titie canforred on Henry VIll. Ly lope Leo X., as a rewart for writing against Dlartin Luther, in 152l. When the king afterwards suppressed the religious bonses at the Reformation, the pope not only recallat the title, but leposell him. The title was afterwarls contirmed by parliament ( 35 Henry VIII. c. 31, 2mil has eter since heen used by the sovereigns of this comentr. The corresponling title in spam is, Nost C'athulic, and in France was, Most Christian King.
INEMERENT, an oll tum in Astronomy, signifying a circle on which the centre of another cirele moves, while a hony is surmsed to be moving on the lattor itself. If we sapurse the sum to he moving round a centre in space, while the earth moves, say, in a circle round the sum, then the sun is moving in the deferent. The term originated in the Ptolemaic system (q. r.).
DEFTCLENT NUMLBERS. A number is said to le deticient whise ahiput parts, or factors, adied tugether make a sum less than the mumber itself: thins, 16 , whose parts, $], 2,4,8$, make together only 15 is a deficient mumber.
DEFILADDIC is that part of the art of fortification which enusists in determining the lirections and haights of the lines of ramprart, so that the interin may not le commanded by the fire of any wrks which the enemy may rase. Defliading is divired into huriznital and vertical. The ulject of the dirst is to provent the lines being commanded in the lirection of their length, or enfilaled; the prolongations of the lines, therefore, must avoid all puints where hostile works cond be erected. Yertanal detilaling determines the heiglat of rampart necessary to protect the interior from direct fire.

DEFILE, in Military Langrage, is the name Given to any lassage which is of such a matrure that it must ixe traversel by trons unly in column with a narme front. Wharever free lateral movement is olstructed, is a defile; and a dedile is a 'Pas' when it camut be avoiked, withont making a hang circnit.
berfinith mRorobetions, Laws of, in Chemistry. Sie Acume Theons.

InRIX THON is the explanation or statement of the meanis of a word, viz, vither the meaning it nowally lwars, or that which the speaker (if writer, for the particular phrenses of his discourse, intomls to annex to it. 'lo give merely amother symnymons name- to say, for instance, that 'Man is a haman luing' - is not commonly considered a dethitimat ail. Names requiring defimtion mantly imply, or commote, a set of attrilates. 'low dince such a name, then, is to enumerate all the attrihatis commoter by it, llence, definition is a limil if analysis.  held, therefore, th be a mand de dedimtion, thaned logically impremect: lat to say that s Man is a feathertess bipend.' inwolwes a ilithernt kind of imperfection. The attribute foatherkess, thomed actually trie of all mons and thenfore sorving to distinguish thom from the only wher hapols, the hirds, is mo port of the meaming of the word, lut is what losicians call an recidutul attrilnate: This kime of imperfout detinition is called is deswitiom. Such defintions are very emmmon in scinuce, and serve suecial phluses of chansitication, In ''uvier's thimal kimptom, man is detmed on descriteel ats it mammiferons anmal having two hiatuls.'

A distinction is generally drawn betwen definitions of names and iletinitions of things, or nominal and real llefinitions. A real definition is intendel, it is sadd, 'to explain and unfold the nature of the thime.' In oljection to this riew, it is repried, that no delimition can unfold the whole nature of a thime, and every true promsition resperting it mifohls smme part of its nature : of all the propsitions, then, unfolding its nature, how shall we distintaish those that define it from the others? 'This question has werar been answerel. The fact scems to be, that 'all definitions are defmitions of names, amd of names only,' but that many expressions that pass fur itefinitions, are something more. They not only dehne the name of the thing, but they comprise a tacit assumption, that a thing with such attributes does or may exist. This is the ease with the detinitions of semoetry ; and it is from these tacit postulates that the consegucnees are delucel, and not from the mere definition of the meaning of a worl.

As there can be no aceurate discussion moses all the terms employed have a distinct meaning recugmised by all parties, it is often neressary to have recourse to formal detinitions of important mames. One of the mast effectuad derices wer yet dis covered for setting the simification of terms, is to declare the meaning opqusel to what is intembat: in this way any ambiguity in the lanaze is at once done away with. Thas, the worl 'natural' conseys no clear meaning of itself; lont if we state what we mean to ecclute when we use it, we narow the variety of signitications to sone one. We may ${ }^{0}{ }^{1}$ nome it to 'moral,' and then it means somethime connected with the work of matter: we may opposite it to 'constraned' or compelleal, giving it the meaning of spontancous or free: other contrasts are the 'artificial,' the 'distorted,' in copyins or representing things, \&c.
The seholastic logicians mate detinition consist in stating, first, the 'gemus' that a thing belunged to, and, secondly, the 'difference' ar peculiarities that scparate it from all the other members of the same genas. This suits for natural history, and for all subjects amologns theretr. For example, if we were attempting to deline 'Poetry.' We conhl not do better than proced per genus et differentim. Postry belones to the class of Fine Arts: it has all the characters commus to Painting, Sculyture, Arehitecture, Music, \&c. Consequently, if we are well acyuainted with these wher sulyects, we ean draw from them part of the characteristies that belons to Poetry; fur example, its having for its end refined pleasure. We then inquire into the dificrence
luetwom it and the whas, which we find to the the

 Batutales, Papmianistat, Lata, and Prolytan. Tho stumat wha hat passed them all sheerssimely was desmond as at locentiatus, from the eremm-

the Iuties of an antecessor on public professor of this sulpect. The practice alloptel in this respect ly the schonls of jurisprudence was afterwards transferven to theology at Paris loy leter Lmanardus. The name Bayhelor is surnosed IVy Mahlen (IHistory of Cnirersitios and Acudenic Deqpers, p. 2: to have been hommand from the terininology of the military hirrarely of those ages.' See Pachelor. - Bachelurs are often styled scholars (Wood, II ist. and Autiof of Gofort, i. P. 59), and the individual invested with this degree was reganded as, at the utmost, an imperfect graduate. At the same tine, in accorlance witl the system of muthal instruction so thoronghly allopted in the schonls of the middle ages, the more alvaned class of schopars were hoth encouraged and eommamled to perfect their own acquirements, and extemd the ellueational influences of the university into the minutest amifications of the system by tencling and catechising the janior menhers of their awn boly (Crevier, Ifistoive de「Cniressité de Previs, ii. 17. 160). Finchelors, though thus intrustel with certain tutorial functions, never possessed any of the legislative powers assigued to the masters" ( 1 , 200,20 ). It was to the teaching masters-and all who tond the master's ilegree were bonad to ferform the duties of tuition for a time -that the term regent was applied both on the continent and in seatland. On retiring from the office of resent, the master-at Paris, at leastteased to take an active share cither in the legisla. tion or the movernment of the miversity (Bulans, par. iii. p. 4010. The question as to whether the institution of teaching masters or recrents onght to In revived, to the extent of permitting them to compete on equal terms with the endiwel professurs, is one of the most important now under diseussion anongst the miversity reformers of Scotland. A very excellent pamphlet in favour of it was publisheal ly Tr Kilgone of Alverdem. in 1950. Sie Barmelons, Masten of Aets, Doctor, licient, Uxivehath:

IDEGRED, in Music, is the difference of position or elevation of the notes on the lines and spaces. When motes are on the same line or space, they are on the same durex, even thongla one of the wotes should be rassel by a shar, or lowered by a flat. When two motes follow hatmically, so that one of them is on a line, and the other on the space arjuining, the interval is of me degree. Subtrictinf one from an interval, qives the degreas which separate the two motes; thas, a thim is separated hy two dearees: a fourth, by three, 8 .

genius is its wonderful versitility. lie has painted ahnost all sorts of subjects, involving a vast varicty of costumes. As a colourist, he ranks bigh, but he is alnost equally noted, as has been said, for his incorrect drawing. What renders his pietures so attractive, is a cortain iramatic energy of execution, with brilliant eflects of hight and shadow. He lias been compared to I'aolo Foronese and Rubens, lint is vastly inferior to both. lle has also been styled the lictor Mug of painting, a criticism which inore nearly expresses the truth.
DELACOA IBAY, an inlut on the sonth-east coast of Africa, lat. $2.5^{\circ} 55^{\prime}$ S... and long. $33^{\circ} \mathrm{E} .1 \mathrm{lt}$ is about 5.5 miles in length, and about 20 in brearth. Into I). I. many rivers fall, among which are the Delagoa liver, from the west, which gives its name tu tlie bay: the Manice from the north: and the Macharanua, from the south. The shores of the bay beiug flat and marshy, are mhealthy in summer; the anchorage, hovever, is commodious and safe, and attracts many whalers. 'The Portuguese bave a small furt here, whence they export ivory and golldust. In common with most of the Portuguese possessims on this continent, D. B. lies ont of the thoroughfares of the world's trathe.
DELAMPide. Jman Baptiste Joseph. a Freneh astronomer, was hum at Aminns. I9th September 1749, and stulicel first undor I Clisle, and afterwards noder lalaud. with both of whom he formed a elose friendship. The discovery of the Ilanet Uramus, in 17S1. gave lim the first "prortunity of attracting the attention of the learnel world in general. Ile formed talles of its nution, which obtained the annmal prize of the Scalemy of Sciences. Soon after, he commenced the construction of new solar tables, and, at a still later IMrind, talbles of the motions of Jupiter and Saturn. Aloug with Méchain, he was appointel by the French povernment, in $1: 92$, to measme the are of the moritian between Dunkirk and Barcelona, which was completed in 1799. Afterwards, he was clected member of the academy. In 1502, he was apminted Inspector-general of Elucation, and in 1803. perpetual secretary of the mathematical section of the Institnte. The result of his measurements appearel in his great work, Besp du sigstime Méripue Micimed (1S00-IS10). In 180, he onamel the chair at the College of France, renderel vacant by the death of Ladande, his master and frimul. In 181t, he was appointel a memher of the conneil of Public lnstruction. He diel at I'aris, weth Angust 1820. D. received a multitnde of homurs huring his lifetime. He was a menulser of mast of the lamed bodies in Europe, an officer of the Lection of Ilomener, and a Chevalier of the Oracr of st Mielam!. Itis writings are very numerons. 'The mincipal are: Truite et Astronome

The Mogul's palace was thought hy Bishom Helrer to surp:ass the Kromlin. The Jmmma Musjicl, or principal mosque, was commenced by Shah Jchan in the 4 th year of his reign, and completed in the loth, at a cost of $£ 100,0 \% 0$. This magnifient buiding has been restored liy the liritish wovern-
 in 1829 the sum of 170,000 rupees was bequeathed to it by a minister of the ling of Oude. The interest of this sum, together with grants from government, raises its anmul rewnue to $f_{1,5}$ sis rupes. For each of the languages, English, Aralinc, Persian, and Sanscrit, there is a separate department. The number of students on the soth of April 1851, was as follows: Christians, ⒉2: Mohammedans, 906 ; Hindus, 105 -tutal, 333. According to the census of 1545-1846, D. contained 187,977 inhabitants, of whom 71,530 are Fimens, 66,120 Mohawmedans, and 327 Christians; but if the suburiss, with their 20,302 souls, be recknod, the total popuation of the city and suburbs will be in ruand mombers l6o,000. The mean temperature of the day has been ascertameel, ly olservations extendiner over three years, to lo as follows: Jamury, $56^{\circ}$; February, $61^{\circ}$; Mareh, $72^{\prime}$; April, $83^{\circ}$; May, $91^{\circ}$ : June, 02 July, $80^{\circ}$ : August, $83^{\circ}$; September, $83^{3}$; Octuber, $77^{\circ}$; Norme Ler, $65^{\circ}$ : December, $55^{\circ}$. The vestiges of anciuat D., on the east bank of the Jmmna, consisting of ruined tombs, gardens, serais, aml palaces, corer an area of about 30 miles in circumference, and present a remakkable scene of desulation. The modern eity is noted for its needle-work, and here the shawls of Cashmere are embrodered in silk and grold. The D. goldsmiths are famons for the delicacy and beauty of their work. D. was the capital of the Ifghan or Patan, and afterwards of the Mognl cmpire. It was taken by a British army under Lord Lake, September 8, 1803 , and has ever since -if we except the lrief period it was held hy the mutineers in 15.57 - continued under British rule.
In our own time, D. has leen rendered memorable ly the events of 1857. The march on the city of the nintincers from Meerut, the terrible 11th of May, the explosion of the powder-magazine by Willoughly and his heroic band, the tragic scenes that followed: the siege, the assault (September 14), when the city was won (September 20) gate by gate and quarter by quarter-a success sadened by the death of the gallant Nicholsom: the subsequent darine capture of the king of 1 . by Jodson of Hodson's Horse,
aml the capture and shoutine of his miscreant sons ly the same otherr, ar" histuriwal farts still frosh in the recollection of the word. Sien The Ihistory

 by the liev. J. 'ave Brawne, M.A. (Filinn and Lomel.),

 of a l'hilistine woman whom Samson loved. Hy her Hattering blandishments, she oltained from ham the secret that his Gou-given strencth lay in his locks: and having ent those of while lie lity andech, she then treacheronsly betrayel the strenythess wiurvor iuto the hands of his enemies.

IHLLLLLE, Jacques, a French poet, was bom at Aigues-l'erse, in Amvergne, June 22, 17iss, imb recuival his education at the Cinlege de Linicux. laris. Hle ifrst oceppiad the fmsitum of instractar at the collegres of Beanvais and Amions suecessibely, and was afterwards appointel to a professorship in laris, at the Cullege de la Marche Here be published various poctical aftusions, the most consulerable of which was a translation of the Gorgics of Virgil a work which anpared in 1769 was distinguished by its grace and clerance uE style amb met with a most enthusiastic rectition. In 1734, he fuldished Los Jardins, the success of which, bowever, was not equal to that of his Grorgias. The Cimente d'Artois presented him with the abluey of st severin, or rather with its revenurs. fur he did nut insist on U. becoming a priest. Ils prem L'Imrgimation was written hlurns a visut which he made to, Constantiunde in 170t, in tha suite of Comte de Choiscul-Goulbjer, the Fronch ambassador to the Uttoman court. Un his retum, he was clected professer of $J$ tellos lottres at the miversity of l'aris, and of Latin lwetry at th, Cullege of France. At the hewolation in 1-5: bowerer, he lust all his property: He afterwards removed to Switzorland, where, in 1 som, be puthe lished L'Homme des ('hrumss. ln isul, he visited London, publishel a translation of Pemplise Loal, and in that same year, having been solicited to return to I'aris, he re-entered the acmlemy ami the college there with wheh he had formorly been conuceterl. He dund list llay 1813.

DELIQUEESCENCE in the term aplliad to the property which certain subatances have of ahsorthar monsture from the air, am? locomin: dampe and even rumning int., licuid. Canstic fortinh, and the charides of calcium and magrestum, are examples of sulstances which undergo this change

DELIRICN (from Lat. deliro, $l$ am furious), a state of deranged mind. in which the intellect and the judgment are 1 erverted or lost. while the imagination and the gassinns are often exoled. or at least left withnat contron. The result is an ineoberent or totally disondered course of action and spech, frequnty attended bydelusions, or uratasonung beloet im sumpsed facts, which the sonnd mind at once previes to have mo existence in nature. The naturc. cxtent. and varicty of the delnions, and the degrce to which the control of the reason
over them is lost, may lie saill to indicate the type of delirinan to which the patient is sulaject; and an some instances, the canse of the disease is fretty decidedly shewn forth loy the prevailing impressions on the inimd and senses. Referrines to the article Insanity for the deseribtion of Daniacal Delurinm, ur Mania, and to the article Ferer for that of TJohoid [ Delirinon. or Typhomania, we may confince wurselves in the bresent article to a sliuht sketch of the delirimm arising from hal,itmal intoxication, the Ihlirium chriosorem or fatutornm (nf drmentarels). ur, as it is more commmoly callorl, from the bublily tremors that aceombany it, Jutimme tremens. 'This disease is not to be confommed with the mere ,aroxysin of intoxication, and still less, if possilun. with the insane cravime for atrink, or Itipomania (f. v.). It is, on the contrary, often fomm in persons who have not beeu recently intoxicated at all, thon he of persistently intemperate habits, amd in whon the desine fur drink, as well as for ford, has heen entirely suppressed hy the aceess of the cliseast: It is a true thonerh usually a temporary form of insanity or of mana, brombt om by the habitual poisoning of the nervous system, over a lome contrse of weeks or momths, hy alioholio linnors; anl it is lot goiner tuo far to say that it is rarely, if ever, induced hy a simate delranch, at least in its arganvated form. I felirinm tremens is characterisel hy a restless, irvitable state of the norvous syatem, wather than ber finjous poroxssms of excitement (thomirl these are mot rare): by comstant thomah ill. monaterl and inetiectanl attempts of the patient to ocompy himself: hy spectral illusions, or the vision :unl hearms of mon-existent ohjocts; liy tremors of the hamls imultomgn ; ly protration iof apretite: and lyy great wakrinluess, the want of sleep beins often protrocted own many days and niohts, amd formine witl the comstant excitement of the sensiss, aml the prestration of the vital powers from deficient monrisbment, the trme smarce of damer in this disease. The main elements in the cure are careful nursing, ant the use of all means to secure slecre and re-estalalish the digostom. Opinm, hyosegamens, and antimony, are used in some cases, and tanics with laxatives in others; chlomform lias also leme -mplosed. In cortain cases, stimulants are redrided for a time; but nom of these remoding mathe evor to lue used excopt under the Inst modual alvier, fur there is little donbt that delimm tremens is onv of the liseases where the rash employment of strong medicines is extremely Iancerons tin life, and where sood nursias and fomb, withent other romadime, will usually sucered. Where proper protection and viesiance rannot be otherwise socmmet, the pritint shond at once le transferred to the wowest laspital w immatic asylum ; and if the attacks have luesu

historical inhalitants were lomians, and it arnans to have been the centre of a mat primetical festwal hed in lanour of Apillo, lath on the mandian?
 the Athrmians, all the tombes were rameen from it, and it was declared pollution for any birth or death to take play on it. Four yoars after, the inhabitants of Athons "xpllal the lowians from the island. After 146 se c:, when (burinth fill, 1 . became the seat of extansive commeres. Its saceral assuciations, its great frestival, its wadent harband, and its sitnation in the direct ronte from komthern Furupe to the consts of Asia, all combinod to rember it a prot highy faromed hemerdants, sio ereat was the trathic of 1 ). . that it is said lo,000 shases
 fin a eonsidurable thane, it wass devastated in the Mithridatic war, and from this calamey it never recosered. Iliny describn's !) as heing mercly a rotk, and only five miles in circomforme. It was noted for its pallon-trees, and alsor for its bratso, and the luazen vessels which it manufactured. 'Ihe town of Delos, which stoorl at the foot of Monat Cynthes, a gramite cras of from 400 to 500 fect hich, is now a mass of ruins Still, however, the remanas of the great temple of Aprillo, and of the colossal statue raisel in his homour, may be distinctly traced, althoneh shiphanls of the more perfect architectural fragments were conveyer, echturies am, to Venice and Constantinople. A fow shepherds ant goatherts fron Mykums are now the only inhabitants of ledos.

DE'LPHI (now Castri), an ameient then of Phocis, Grecee, edehrated chindly for its finmons oracle of $\mathrm{A}_{\mathrm{p}}$ ollo, was situated illout elight miles north of an imlentation in the northern share of the Gulf of Lepanto (Corinthian (ialf), at the southem base of l'arnassus, in lat. $35^{\circ} 9 \sigma^{\prime}$ N., am long. ${ }^{2}$ 37 E. Its original name, and that ley which Homer invariably speaks of it, was l'ytho. It stume in the centre of a district renownal for its classical associations. Ocenpying the vale of the Pleistus, it was seatel in is senicircle like the area of a grand natural theatre, backed townels the north lyy two lateral spurs of lamassus. These lateral ranges ratend east and west around 1 ., and give rise also, from the peint at which they approxmate, to the famons fountain of Castalia, the holy water of the Delphian temple. The carliest inhahatants of D. are sail to have come from Lpeoreia, a town mon one of the slopes of l'armassus, the inhabitants of which are supposed to hare heen Durians. From the Delphian nobles were at thrst taken the chief magistrates and the priests of the temples, while the l'ythia of female who delivered the made, at first always a yonng mairlen, but latterly always a woman not younger than fifty, was usually selected from some family of poor country-fieople. In the centre of the temple was a small nponing in the prouml. whence arose an intexicating vapon'; and the 'l'y thia laving breathed this. sat duwn upn the tripul or threcelegged seat, which was phaed over the chasm in the ground, and thence deliveral the omach, which, if not pronomeed at first in hexameters, was handed over to a poet, emphoyed for the purposis, who eonverted it into that fomo of serse. As the celdority of the Delphic oracle increased, 1 . lecame a town of great wealth and impurtance. In the Sth c. before the Christian era. it had hecome famous not only in Haclas, but also amony the neighlouring nations. Here the l'ythian games were first cllebrated in 586 b. c. T'lue first stome temple at D., buitt by Trophonius and Agranerdes. was destruyed ly fire in 54S E. c.. but was rebuit at the cost of 300 talents, or $£ 15,000$, ancl was tronted with Parian marble. In 450 L. C., Xerxes
sant a promen of his army to phonder the temple; lout as they dimbed the muren path that loin to the shrine, a peal of thather hrohe orehacal, and two hum "rams tumblimg from the buthe crusbed many uf the: Persians to heath, while the wethers, stmels with thror, tumen and diol. It was phaterad by the lhowats durins the sactal War, aul was
 by that rome. which the P'risians had on a former

 attacks. Nowe carral wh from it 5on statues in lwonze; Constintine alsn femmon many of ite works of ant to lis own cunital. In the tume of I'liny, the number of statines in Ib, was mot less than amio, :und wathin the tomple for a loisis thay stome a roblun statue of Aprille.
'The momen town of Gastri m, ocompres the sito of Doluhi. Its situation is leatutiful, amL from it the traveller may command an vathent wow of the ancient valley. Castri stands in the immoliato neighlourfood of the source of the still flowing Castalian spring.

DE'IPPHIN CLASSICS, an chlition of the freek and Koman classies, prepred by i9 of the best seholars of the tme, moler the editurship of lbossuet and Haet, tuturs to the Dauphin (q. v.), son of Lomis XIV. The title-prases bear the words, 'In usum Screnissimi Delphini,' and bence the nane. They have never been reprinted as a whele in linglami, but octavo editions of particubar anthors, such as Singil and Horace, have been pablishen for tha: ure of selmols. The Delphin Classics pussess little value in the eye of a scholar of the present day.

DRLIPIANAPTERA, a gemus of Ceturn, of the family Delphinatio, arreciny with ISClegu (f.v.) in the want of a chorsal tin, but dithering in hasing the snout prowluced into a slemer heak, which is flattoned transwersely, and soparated from the hem ley a maked furrow. I. Permii. the Jifint

DELPHI'NIUM. See Larksict.
DELTA is the allnwial deposit formed at the mouth af a river from the deposition of the pratieles which it has heh in suspension. The term was wrimally applied to the tract of land thas formed by the Xile, which, locing enclosed hy two main branches am! the sea lats the form of the (reen letter $A$, Delta. The fomation of deltas depends more upon the presence or alsance of currents met with at the mouth of the river, than upon the quantity of seliment heh in susjumsion when it reaches the sea. Heltas are consequently of almost invariable vecurrence in miant lulses. in the guiet estuaries of the nearly tileless IINJiteranean, and in the sheltered lays and gulfs ni whor saas. When, on the other hand, there are stroms elb-tiles, or powerinu ocemic eurrents, the detritus is carried off into the sea.

DELUGEE (through the French, from Lat. ditucium, a washing away, a flood). There is searcely any considerahle race of men among whom there does not exiat, in some form, the trantion of a great deluse which destroyed all the human race excopt their won progenitors. That the Noachian deluge, recompled in soripture, cusered the whole earth, was the universal opinion until towards the close of the last century. The organic remains, on which the science of palrontwlogy is now founded, were regardel as its wrecks, and were held to prove that it had covered every known country, and risen over the highest hills. In the progress of geolory, it somn became evident that most of the stratified rocks demanded an earlier origin than a few thonsand years, and the induence of the deluge was consorguently restricted to the slightly altered superficial thensits; lont many of these were, after a few years, fumbl to belon: ta a perion vastly anterion to any histrical enoch, and to have been protuced ly long-continued aml steaty agencies, differing totally: from a temporary defuge The present temency of minion amonr writers like the late Hagh Mhller. is tor requed the Dlome of Noah as partial and lucal, althong the miversality suens to be implied in the biblical demeriptime

DE LUNATICO INQUIIEENDO. See Insanity (legal).

DE'LVINO, a town of Eurnsean Tarkey, in the province of Albania, leantifally sitnated on a hiflslope covered with olive and cuacte groves in lat. $40^{\circ} \mathrm{N}$., long. $20^{\circ} 15 \mathrm{E}$. It is fortifect, is the seat of a Greek bishop, and has a considerable tranle in oliveoil. The women's dress is peruiar, being a long white wraper, enveloping them from hat to foot, and giving them the appearance of animated monumental figtires. Pop, estimaterl at 10,000 .

DEMAND AND SUPPLY. The nature and inthene of the law or acency so designated by [ohitical bonomists lave been the subject of comsiderable dispute, It las sometimes been maintainel as a rulinif principle, that the doman for anything creates the supply. This has heen denied, howerer: and it has buon held that, on the contrary, the suphly prearales the inmand. since the article must be in exintenoe before is fmehatser goes to ask for it. Stran-onerines, for instanes, ami india rubber giloshos, mot hase laen invented and made lefore any one thonght of purchasing them. The most convenient way, perhaps, of riewing the twrus A-mant and sumply is to consider it as applicable to antiches in the market; ant bere we shall lind that the drmand and the suply are contimally viluatins with $\Omega$ teminency to balimen. Sometimes ther" is mere of ath artind than will sell at is rommeratime price, sometimes less; but there is ahays a strons tumdency to a balance. Thus, on
any day in Loodon, the surply of leef or of fish may le less than the demand-that is to say, the trade may be so brisk that had there heen a feve more bullocks at smithtield, or a few more samon and turlut at Billingsgate, they might have been suha at remunerating prices. At the same time, there may happen to he an excess of hoth commombities at TVindsur. It never will harren, however, that a sumply suited for the London market will find its way to Windsor, or that no more will reach London than might feed Windsor-it watel he as rational to expect the river Thames to reverse its course. This is the great law, then, by which the world is supllied with the necessaries of life. Every day the proper supply for the enormous consumption of Loudon is on its way from the uttermost ends of the earth, as systematically as the sap is ascending to penetrate throurth all the branches of the tree. IIow impussible it would be to effect the same thing lyy artificial organisation, may be illustrated from the hussian campaig of Napoleon, where, lessite of the must skiffal and costly arrangements, nue portion of the army were starning to death, while another were slanghtering their bullocks and leaving them to rot! It is necessary to keep in view the proper function of this law, which is in some measure defined under Competition (q. . .). The demand will not produce everything: wo money will bring forth when wanted a Milton's Parudise Lent, or a liaphael's 'Transtigmation.' On the other hand, there are services beneficial tos the world, or to a community, for which there is no demand in the commercial sense. There is a demand for almanacs, but none for the astronomical investigations on which they are founded. There is a demand for teachers of Latin and Greek, and for Latin and Greek school-hooks, hut none for the mofomod schularship necessary for kueping the knowlulue of these languages alive; henco come scientific and scholastic endowments and establishments.
DEMAVEND, the name of a solcanic mountain in l'ersia, situnted about 40 miles morth-east of Teheran. It is said to have an elevation of about 20.100 feet, and is of conical form; several hot springs have their somee at its base.

DEAM1: $\mathrm{E} A$, LAFE OF, in Abssinia, is situated in lat. $12^{\circ} \mathrm{N}$., long. $: 5^{\circ} 15^{\circ} \mathrm{E}$., and is about 60 miles in length, with an average brealth of 25 miles. It occuphes part of an extremely fertile plaim, situated at an elevation of sumb buth feet above the sea, and contains several brantiful islands, one of which is inhabitel. Its southern protion is traversed by the blue Nile.
 known in britain through his connection with the Inanarian revolution, was loon in the falatinate of Cracow, 16th Jinuary 1791, entered tho lolish army in 1su!, tould part in the invasion of Russia by the Frenels in 1512 and was moude eaptain liy Napelem himself on the battle-fichd of Smolensk. Ile sulserpmotly distinguished himself at Leipsic. After the fall of the Empire, ho returned to has mative comotry, and lived in comparative olscurity fur some time. The lolish revolution of laso called lim again to arms. He abtaned the command of a hrigald of cavalry, and exhinited horaic canabe at the battle of kinlew. Afterwards, he made the campaigh of Lithamia, nodn' Condgut: and arrising in Warsaw-having trawersed the ratire linssim lines was mankem-mander-inechat of the national army. After the surrember uf W'arsaw to the liussiaus, I! Went to
 Compragne de Lithumie (Strasbourg, 18: in). In

1833 , he proceedel to buypt, and whend the some of Mehemet Ali, but ratmont th liaris in las. On the motheak of the llungrian insurpection, h.. ofterel his services to that anantry, :mal hassith
 amy. He drew wi a phan of the cannaina, but condl not ohtain the ancumeno of domai, whose tardy arrival callond the low of the bathe
 to recreat behmi the Theiss, 1 . wesimal his command, hat subserpently comsintiol ta iwt mader Messuros. He stronaly whed the massaty of batimy the canse of dhanary winh that of foblan, and pronsed to land an anmy into dalicia; lont has aluse was mot takn. Veter the mesignation
 at Vilams (libth Augnst 14.t!), 1). Hod to Turkery. In 1 Sont, he returnal to brace, and ommenced to Write his Afemeires on the llunsarian war. (Ife contand to live in laris till his death, whels tosk phace lath Junc lacil.)

DFMHABBEE, or IHSMEMDERED, a horahdis torm to signify that the mombers

Dismemberel. of an animal are cut from its lowly.
Thme'NTIA. Sec Inshity.
TEMPRARA. a district and river of British (iniana (of.v.). The river D . is upword of 200 miles in length, is $1 \frac{1}{3}$ mile hroul at its mouth, and is navicable by ships of cousidemale lurden for lor miles. Its athuents are numerous thounh small, and at its emonehure into the Athatic it atfords a spacions harbour, obstructel, however, hy a bar. It has many settlements on its lanks.

DEMESNE (Lat. Torrep dominicotos. Domini(cum), in the present hay, may lie said to the the right which the owner in possession of lands in tore simple has in his estate. lint the oriminal sirnitication of lemesne was that purtion of the lands of a Manor (q. w.) which the hori of the manor reserved for his immediate use and oompation. The hands sur resteved were either in the cultivation of the bow of the manor or his Villems ( $\mathrm{q} . \mathrm{v}$ ), and were thus distinguished from lands eranted or sulfenert to vassals for services to he renderal. Sir lome as the mation of sob-infemation enntiment, the fimesse lands were a distinct and segarate right; lont the
 sub-infenlatums, ami decharel that on every transfer of land the feofee should hidd wit the lord paramomet, all lanls hecame of necessity demest", being in the actual possessim of the ownor or his tenants.

DEMESNE, ANriEvt, a species of Copyhm 'lemure (q. w.). Lamls held in ancient demesne are said to have belouged arigually to vassals of the crown. The services rembered weredeminate. mot varialle at the will of the lorl, and more hommalle than those of copylohd in general. The tenants also were entitled to certain privileges and extmptions from fendal services. But in process of time, the character of the services apmears to have variod; so that in the present day tenants in ancient domesne in some instances differ litite from ordinary copshod tenants.

It is situated on a tributary of the Farasin, at the foot of an old fortcrowned hill, is fortitied. and contains several musques and a Greek church. Pop. 8000.

## DEAI'se. See Lease (Exglish).

DEMISE OF THE CROWN. That 'the king never dies,' is a maxim of the fuldic law of this combry, in accordance with which, immediately on the diath of the reigning monarch, the sovereignty passes to his suceessor, ly the act of the law itself. No installation, proclamation, coronation, or other cerenony is required to vest the new sovereign in the regal office, and thes there is no interval or interregum, and the royal dignity remains perpetual. The word demise has, in Euglish law, the more general signitication of a lease or conveyance, by which a man grants lands or tenements to another for lite, for years, or at will ; such estate being short of the lessor's own interest therein. It is thus, as it were, by a sort of courteons and loyal amalogy that it is employed to simify the death of the sovereign. "so teuder,' says Rlactistone, 'is the law of supposinn cren a possilility of his death, that his natural dissolution is wenerally called his dimise, an expressinn which signifies merely a transfer of property:

 It is intoresting to thane the proress of this infer, whuh now puys so important a part. In firese. whence we elerive the name, it was molerotumb to mean it commonwealth so constituted that the pumer was axerised ly the buly of the citizens (the domon), and not ly an indivilual, or by a dmoninamt easti: Democrapy, therefore, stomil opused lnoth to monarehy ami aristoracy. Most of the repuldies of (ireece, more especially that of ithema, were elemomacies in this stonse. The name ly no noans implied the notion of an alosolately enaral rient in all citizons, still less in all men, to the exorrise of political power. Neitler the total almeners of rights of all limels on the part of the lareser lialf of the porulation, the slaves, nor the distimetions recornised by law among citizens proper (o. or, the *xelnsion of the poorer citizens from office untler the Solomian constitution at Athens), were consideresl incompatible with the nature of a democsacy; thourl in regard to inequalities among citizens, the continually growing force of the lomocratic principle temed to their gradual extinction, ant the trausference of power to the mass of citizens withont distinction. Aristotle regarded this as an meronchment of ochlorracy (mobocracy), the desencmate fom of democracy, or democracy proper. Or more freguently, he speaks of democracy as the dewnerate form of the polity (ir. politern). The $1^{\text {nulity }}$ with him was the form wlere the many govem for the common bencfit-Polit. III. chap. $\overline{3}$, and 1V. chap. 6.

In modern history, we meet at the rery threshold a state of society which may be called ternoneratic. Among the German nations, we find an almost perfect equality of all freemen (i.e., all that were nust slaves), ind real self-govermment exereised by these freemen in each separate tribe. For the personal distinction eujoyed ly certain families gave them no priviletes over the other freemen, and where royalty existed, it could hardly be said to rule, since the kiner emblid to nothinir withont the concurrence of the assembly of frecmen, and reigned not by mere hirthright, but retured the confirmatory choice of the people.

This condition of general liberty and equality gave place gradually to one of a quite opposite kind. Through the growth of the Fendal system (is. v.), the majority fell into a more or less alject dependtnce unon a lrivileged minority. The mass of fromer freemen, now sunk into scrifom, were hardly clistinguishable from those properly slaves, whose pusition, on the contrary, was become less lelemulwat. The dominant class, the nobility, limaleal all that rial not belong to themselves ats 'people." 'commonalty,' 'canaille.' Thus the term 'people', which in the ancient republies implied the rifhts of citizenship, came to denote the masses that were without rights. The distinction hetween the dominant class and the mass of the perple rested chiofy on two points-exelusive oecupation in war, and the free possession of land, which was granted for warlike service alone.

 tinus, a merelazat who hat mate there vapaters ranked with a thance; and som after the Fomman Conpuest, the citios were represented in parizannt on an equal fontiug with the warlole andinctatey Thas took plowe later an the continent, and never to the same extent, +xepet in the cities of lambariy and landera, where, at an early forionl, the eitizen clement entered the lists with the fomelat and warlike. Even within the cities, the sane enotest was carried on botwen aristneracy and democracy. At first, it was nuly those carrying on comanerce on a litree scale that assemted their right to take part in the municipal onvemment of the towns: but the trathes on grilils sum set up the same claimes. Jharsez chams were fertinacionsly prosecuted, and fiten led to hoody chintests, but sooner or later ware everywhere victorions. Thus was the hasis of flemonray walener ; although the gulds also dill not fail tis manifest an aristocratic and exclusive spirit towards the borly of the peonle not belonging to them, ami with their restrictions and monombes acted oprese sively to the country population. It was not so easy for these last to break the bunds of feulal subjection in which they were bedd, on to acquire any politieal stamdins. Isolated attempes's the thow wif the yoke, ly yeasant insurrections and wars, faiked, and only were followed by increasal oppression. The abrupt division letween the feudal fussessor of the soil and the serfs under him continued long everywhere except in England. There the rizomir of the relation becan early to give way, and the transition was effected in such a peaceable and gratual way, that the English historian camot sity exactly low or when. Fur the greater part of the continent, it was not till the French Fievolution in 1759, and the impulse given by it to legislation in otber countries, that the agricultural popmation aequired more or less complete frecdom and equality with other classes.

Thus hat one part after another of that 'people,' so oppresser and contempitumisly thrown into the backegrous by the dominant "ans in the midde ages, emerged from bomdage, and successfally asserted a participation of ribhts that were at one time the privileres of a sincle class. The aristocratic principle of foudal society, the principle of exchasion, privilege, of the subjection of the majority to a minority, had given way to the demoeratic principle of the "rual rixhts of all elasses, of all callinas and employments. Siat the development of this last principhe was not yet complete. These who has made gomal a position in the state aloneside of the fendal aristocracy, formed in their thern an exclusive class, takiner their stand on eertain material gromels. Thus, the merchonts, as repro senting larue masses of capital; the milds. with their privileged inlustry; the anriulturists. as fussessurs of lam?, however little : all the interests formed, as it ware, another aristocracy within 135

## DEMOCRACY.

the democracy. They were demoeratie in their origin, and as compared with the class that was at one time exclusively privileged; but in another mint of view they were aristoeratic, since there still remained without a mumerous bohly, which, in tead of elevating to political power with then, they rather repelled, and treateci much as the molility had treated themselves. This residury mass, which now came to le chiefly designated by the mane 'people.' comprehemed all those who pussessed no capital, no privileged trade or callings, no laud-nothing, in short, hut their personal powers and eapacities for work. This class forms at the present day by far the most numernas purtion of the population in nearly all the civilised states of Enropes. The designation 'people,' intended to be derneciative, is taken by then in the very opmosite sense, and they gromd upm it their claim to rule the state, as beims properly the perde, the numerically strongest class of the community. The preference given to the class of possessins, they look unon as gronndless aud absurt, just as these hard judued of the nobility; they therefone elam perfeet equality with them, especially in the exercise of the hughest political rights, it is from this point of viow that miversal suffrage and the rule of mere numbers, withont regard to possessions or wher conditions, has been proclamed as a self-evident consequence of the demueratic principle.

With this there is commected in many quarters in still farther extension of the idea. The same principhes, it is said, that bave dictated political reformations, call for a remodelling of the social arrangements of mankind ; that the pussessors of promerty, the bouryoisie, ought to be deprivel, not only of the $f^{\text {whitical }}$ privileges they have hitherto enjoyed, but also wholly or in part of the material basis of thone privileges, their property. so as to proluce a perfect equality, political, material, and social, of all elasses. "l'bis gives rise to a division of the democrats of the present day into two parties: the porely democratic party, aming only at securing the political consequences of the democratic frin-ciple-miversal suffrage, and the abolute equality of sucial rights; and the 'ehemeratie and sueial,' who look upon the attaimment of political rightis as roly a means of ultmately securing the general social equality of men.
'There scems, however, to le a fmmamental error in thas treating the relation between the ${ }^{n}$ nssessinnless class anel the possessors as anmonems to that betwen the serfs and lords of fembalism, Tho eontest of democracy against feulalism was not primarily so much for equal rights as for this, that among the same people mere birth should not make whe man priviluged, and a ruler; another testitute of all rights, and hound to obey. It was a conterst fin persmal freelom, the right for wery man tu use his jowers for his own behorif, aml not for that of a mastor, the ringt to the free pessession of lame \& lanticipation in political riphts was chicily prizal as a guamene for securing this premat and sumial liberty. Now, there is mo suell absolute distmetion hetwen pussessors of property and nonfussossors, as lutwen the nobleman and moturner

society actually presents (see Sociamsm) ; but this by no means follows necessarily from the notion of democratic equality: All that this notion requires, seems to be the removal of all privileges that destroy the mity and homogeneity of a nation. the establishment of complete personal and social liberty, and of the eruality of all in the eye of the laws; aud, in regaril to political rights, or direct partieipation in the govermment of the state, such in form of constitution as will exclute no fixed class of citizens as snch. All this, howerer, seems quite compatible with making the exercise of the different molitical functions repmatent, in the case of each individual, on certain guarantees, and not admitting the whole body of the prople to share in the government of the commonwealth at onee, but only in roportion as increasing culture renders a wider circle capable of such functious. If we may juelge from the example of England and Belginm, this is the way in which the real and steady progress of the democratic minciple is hest secured.

In France, the fendal principle, instead of a timely compromise with the democratic, as in Eugland. came to a strugre with it of life and death. The consequence was that victurions democracy, instead of seeking to satisfy the practical wauts of society first, and leaving the thenetical to be attained gradually, momertook to reorganise at one stroke the whole politieal and social fabric. In Germany, things tork lately a similar course. The ease of America is peenliar. There the fundation of the state structure was to be laid on a clear site and the first page of the history tu he written. Those who came together to form the new commonity were persoualily perfectly frec and equal, and the local circumstances were such as to favour the exercise of this liberty aud equality, ly vendering any very great disparity in material means impusibla. In such circumstances, the emastruction of a perfectly democratic order of socicty could be carried onit without struggle, and withont any dangerous staining of the prineiple. There no one looks umon the restriction of the franchise to residents-which is the law in most states of the Union-as an infringement of the demoeratie prineiple. Norway lears no little resemblance to Americas in that country, the demoeratic element was never so empletely crmshel as in other parts of the continent, and that form of society is favonell hy the means and strlo of living, which are extremely simule, and are bascal on a bearly equal division of the soil.

In the development of democracy in molem times, circumstances have directed its attacks rather against the aristoratic, than aganst the monarchical minciple. At one time, monarely, in its strugrye with the aristocracy, fomm its natural allios in the donocraey. The prineces, in striving to brak the power of the ereat mbles, which limited their own, oftem ealled in the help of the domeratic edement, party ly coufering privaloses on lombes of the f"Wh: such ats eity "orpmations, and partly hy attaching individuals of the 1 mon privileged chasses to their persomal sorviec, amb apminting them to inthential pusitions in the state. The rond to pown and distinction was, it is traw, alramy open to indiviluals of the demoratey thromish the church, whese dimenes and prishlages were mot continel ta the moble hy lirth, hat were aceessible to persomal capacity. It a later periond. the unsersities, especially in the fuculty of law, fomed fur the demaraty stepping stames in juwer. from which they somedinus one tupad the arintoracy of hirth. Ame when the phanes at thar land the Lanis of framer... amane
 (1) the fordal molifity, ly wating a lmanacratic state manhery, ind lavomines intelligence in every
form, the very widest path was "promed to the democratic element for attainins inflames and distinction. It is true that all this was at the enst uf its most essential principle; for the epuality creater by a levolling absolutism, raising the low and depressing the high, was mothing more than an equality of depembence mon the one alsolute master of all.

The relation between domocmay and monaredy was dillierent where the ruler cane to lee limiten as the chicf ofliece of the nation. Snch a limitation of the parer of the monareh, ly mans of a representintive syatem not condined to the priviluged classes, lnt embracing at least the citizens of towns, was in itself a victory of the demmantic primeiphe. As the circle of this popular representation widens, and its influence in the state increases, suble a monarely becomes more and more lemocratic in all its institutions.

In a purely democration state, the people may excreise their power in either of two ways-directly, or throngh delegates: in the one case, the demueracy is said to be abolute; in the other, representative. 'Ihe alsolute or direct form prevailed in the repmblics of antuputy; political representation, in fart, seems to be a modurn inea. The same is the case with the origimal swiss cantons, where almust all pulbie Lusiness is diseussed in a full assembly of the people. In Switzerland generally, the representative fom is now preferred. It is also carrice ont in the states of North America, and was adrpted in the French repuldie of 1S48. The absolute form, in fact, is mony adapted for small commumities with a prpulation concentrated as to space, and differing little in mode of life or culture. According to some, the representative system is inconsistent with the principle of democracy, as the will of the prople is lialle to be falsined and crossed by the very organs that are to carry it into exccution. It is rather an advantage, however, that the first impulse of the public will, sometimes passionate and short-sighted, should be tempered and enlightened, by passing throush a serics of media on its way to action; and the hold which the constitucncy have unom thair representatives, by means of frepuent reelection, and in other ways, is sufficient ghard against any defeat of a steady, earnest pmblic conviction.
MI. de Tospueville ami Mr J. S. Mill have applied themselves to setting forth the evils and dangers of Wemocracy, which they-the later especially-both regard not only as a system that mast inevitably extenl itself, bat as the ideally ferfect form of grvernment. Mr Mill is at seat pains to show that self-guverument by a rejresentative democracy is what develops, in the greatest dence, the grow mental qualities, both intullectnal ani moral, of the governed, and that it is desirable gradually to extend this participation in the acts of govermment till it include the cutire alult jombation, male and female. On the other hame there are two sources of evil to which we are liable, more on less. as democracy approaches to the term of universal sutirage, and which are to be proviled against by proper constitutional arrangements. The tirst of these is the iusuftieient mental gualifieations of the governing body for the highly complicatel work of fovermment. Public alministration is a profession, like engineering, medicine, or the law, and ilemands, no less than these, a special training aml devotion of mimb. In monarchies and aristocracies, the management of athairs is in the hands of a few, who make it the husiness of their life, and acquire the reguisite shill for dang the work well. In a democracy, this advantage is lost, except in so far as the details of administration are left to skilled olicials; the publie assembly morely retaining the power
of checking and controlling those oflicials, and of determining gencral rules of policy.

The where langer is the predrminanes of the labominer vars, ly witue of their mamers, owr the class mande י1p of employers of labome, and the rich amb extucated genemally. When there are two of mure classes in the emmmanty with contlictiner interests, the desinalds arrangement is, that their fuwer should le rapally batanced, so that an party conhl carry a pant by political position alone, or
 of some mombers of the otlace farties. But if tho sullrate. were miversal, the labmane class intere st would be the pred minant one; and so scrimes woble he the dianger of class leggislation as at result, that Mr Mill thinks it neerssiry to provid: a remedy in the slape of granting a plurality of votes to certain persons, especially those distimsuisued hy elncation, so as to restore the balance-- Considerations on Representutice Gorernmeut, chap. viii.

DEALOCRITUS, an illustrious (rrek philosopher, was horn at Ablera, in 'Ilrace, abont 470 or 460 b.e. Of his life, little is known. The statement that he was first inspired with a desir. for philosophic knowlalge by certain Magi and Chaldeans whon Nerxes had left at Abrera, on his Cirecian expedition, is as umtrustworthy as that which represents lim as ementinally laughing at the follies of mankimi. Ilis extensive trarels, bowever, throngh a yreat portion of the East, bowe the reality of this desire, as docs also his ceascless industry in collecting the works of other philusophers. I) was by far the mast learnel thinker of his age. He had also a ligh reputation for moral worth. He appears to have left a strmer impression uf his disinterestedness, modesty, anil simplicity on the mind of the communty, for even Timon the scoffer, who spred no one cilse, praisal lim. The period of his death is uncertain. He livel. however, to it grat age. Only a few frasments of his mumerms physical, mathematical, cthical, and musical works are extant. These have heen collected ly Mullach (Berlin, 1S43). Cicero praises his style, and Pyrrhon imitated it.

D's system of philosmpy is known ats the ntomic silstom. Its essence consists in the attempt to explain the different phenomena of mature-not like the carlier Iomic philosophers, mantaining that the original characteristics of matter were quelita. tire, hont that they were quantitatire. Ile assmmes. therefore, as the ultimate elementary groum if matnre, an intiuite multitude of indivisilide corporeal particles, atons (see ATon), and attributes to these a primary motion herivel from 1 n lisher principle. This mution loringe the atoms into contact with cacle nther, and from the multitulinous combina. tions that they fomm. sprines that wast and varying aggregate called nuture, which is presented to our ayes. D. din met acknowledie the presence of design in nature, but he almittal that of luw. "The worl chence,' he says, 'is only an expression of human imnomance. He helievel strictly in secmary on physical causes. hat mot in a primary inmaterial canse. Life, conschousness, thombht, wre, accordmer to him, lerived from the tinest atmos; those inaves of the sensums 1 honomean surnmonting us, which we call mental representations, were, according to him, only material impressims, caused ly the more delicate atoms streamine thron h the pores of our organs. 1). bohlly apmlen his theory to the gots themselves, whm he attirmed to le agregates of atoms, why mishtier and more powerful than men. ritrame to say, the ethical system of 1).-in spite of the ervisiness of his metaylysics-is loth pure and noble, Such froments of his writings as we posses. contain bantiful, vigorons, and true thoughts

(:h olit. 17.n). D's name is well knowa from its association with a useful trigonometrical furmula viz., that whatever be the imlex $n, \cos n+\sqrt{-1}$ sin mis a value of $(\cos \theta+\sqrt{-1} \sin \theta)^{n}$.

DEMOLITION, in Mititary Operations, is rue of the destructive parts of the duty intrusted to the engineers. When works amb hmblings belonering to the enemy are to he destroyen, to facilitate operaitions on the one side, or to olostruct on the other, mules are laid down by which the demolition nay le most easily and quickly effected. The quantity uf grapoweder to le blasted for bringing down masonry of a partieular thichness, the determin. atim of the line of least resistance-these, ami simidar matters, are required to be studied by afficers of the enginter corls.

DEMO'NIACS (elemonataci, obsessi, or, with refernce to the smposed inturnce of the moon, (muntici), the mame siven by the Jews to jersons afflicted with epidepsy, lypochondria, or insanity. diseases of frement cocurrence in the East. The name orisinated in the beljef, that persons so afficted hial becin taken prossession of by Eril Spirits or Wemons (c.v.). It was a prevalent opiuion amon! the Persians. Grecks, Fommens, and the aneients senerally, that the extrandinary conditions and actions of men. which conld not lee referred to the known and apprent operations and powers of the mind, must be aseribed to the intluence of one or more higher spirits. This lelief is fonnd in Homer, Heradotus, Euripides, and later writers, and also ronted itself very deeply in the Christian mind durinc the mikdle ages. As the good, when heyoud the limits of the ordinary powers or faculties of great men, was attributed to the inspiration of the Buses, or to the direct co-operation, or even inearuation in their persons of some beneficent leity, so also that theep internal umhappiness of 'a mind diseased,' which nostrength of will, ant no physician's art in olden times conlal remove, was as imbesitatingly attrihited to evil sinits, or demons, as the later Jews. probathly with an whique reforence to pagavism, called them. Spells and cxoreisms, in consequence, took the prace of the healing art in refercuce to such as were supposed to be demonised, and the Jewish exorcists (lemon- banishers) alleged, ncoording to Joseplus, that they possessed the necessary macic formulas, wonter-working roots, \&e, which had heen landerl domm from antiquity. The goot spipits thus appared-in harmony with the idea that healing was a thing natural and divine in itsulf, the nommal action, so to speak, of natureto fulfil their function in lanishing and destroyine the demons. Thus, C'hrist aplears in the synoptic finspels as healher many who were possessed of unelean spirits, casting out devils, \&c. But apat from the fart, that a helief in elemoniacal possession was more vital amd universel among the later Wrws than amonor the other mations, on aceount of thair being mome derply penotrated by the consconasness of sill, and hy a consiction of the myaterious commetion hotwoul covil aml Satan, it was alson expected of the Messialı. the Anointed of Gubl, that lie wonly possess "jon'י"' aver demons. 'This fundanental natimal lreliof womld uncomscionsly prepard the contomitmarius uf (harist for regameling his oliviak exrroise of the physibiats art from it relitpons rather than a sobitilie proint of view. When they foblul the mirambors eflects of his "Jower" "n the losios ann! spintes of the so-cilleal Thmoniaces, it was mataral that they shomble speak of it in lansmate intollicibo for thew age, and in harmany with its encomeral notions. To laive used athor words from the stand-puitat of at higlaer scientsic knowledge, would have leen as confusing

## DEMONS-DENONTE.

 which aro "qually manifest whichever theory may lee anhoptel. "l"his view of the question, which is hedr to he in conformity with semmel science amt somm] criticism, presents itself almost irresistibly to the candid and impartial student of the Lible, whern he lazas in mind that there is nothing in tha reconlenl examples of emoniacal possession dillerent from the ordinary symatoms of eprlepsy, lypuchandria, and insanity, which are not now beymml the jhysician's skill.

DEMONS (Gr. dnimŏnes, Lat. grnii) are, necording to superstitions belicf, spirits which exereise an intluence on the fortumes of men. Their elignity innl character have both changed greatly in the comrse uf time. llumer calls the gods demons, and thimonicthos is with him equivalent to dicine. I Iesior] allirms that there are in the air 30,000 demons or ministering spirits, who were the sonls of mon in the Cohlen $A$ ge: but a proper elassification of these is tirst found in the l'ythagorean and Nro-l'latonic systems. Aristotle se]arates the immortals int, giods anl demons; mortals, into heroes amb men. ]lato, from whom Aristotle probably received the lint of his rivision, says in his symposium that "the demon is a middle inteligence between Gorl and man, ant the mating link whieh eompletes the chain of being.' In other places. le informs us that they inhalit the air, wanter throngh the sky, hover over the stars, and tary on the ciarth. They also sce the hinden issues of the futme, and cam alter them at their pleasure. Every mortal receives at his lirth a partienlar demon, who accompanies him to the end of his life, and liears his soml to the place of puritication and pumishment. In reneral, it may lee sail, that the irreeks included the divinity or deity among the demons, in so firr as be arranged ant disposed the dissimilar fortunes of men. In reteremee to the actions ascribed to then, the demons Were divided intor rood and loul-erquthotaimonce amd bukodaimoncs. These evil demons were not, however, originally supposed to be hostile to the divinity or supreme dewon. They came from him, and carrid out his purpose as truly as the gool demoms. This was precisely the belief of the earlier Jews also, as we lind, for example, from the history of Sanl, intu whom Goul repeatedly sent an 'evil spirit,' $i_{1}(\cdot$, a demon, in the elassiend and not in the medieval sense uf the term. The demonism of the Jiomans consisted chielly in the worship of departed spinits. See Mante, Lures, and l'enates. The origin of the duetrine of demons is to be sunght for in the East. In the teraching of the Jinulus, who. hestues the limhest Deity, Jrahma, recognise a comatless number of divine arents or onessengers, the demmens are called deifies. In Parseeisn, or the religion of Zoroaster, however, this sloctrine is fomm in its must systumatiu anl ubborate development. Indeed, the J'rsians and, Tews alone amoner the nations of the (lld World hat the conception of evel spirits headed by a chicf demon, it Sitan, who was uver

## DE MORGAN-DEMOTICA.

1)E MO'RGAN, AUGUstus, was bma in 1806 , in the small Indian island of Madtra, on the northfast cunst of Java. His father was an officer in the Pritish army. IIe was edncated at Trinity College, ('ambridge, and took his degree of P. A. in 1827, when he was fourth wrangler. He was aplointed first Professor of Mathematics in the University Enllere, London, after its foumation in 1828. In 18:31, le resigned this office, but was reappointed in 1836, and has continued in that capacity ever since. His mitings are very momerons. Besides being a mathematician of the first order, he is extensively and mimutely rersed in the history of the mathe. matical and physical sciencos. He las also devoted himself to the development of the Aristotcian or 'Formal' Lagic, to which he has riven so symfolical a shape as to make it seem like a lranch of Algebra. He has written likowise on the ealedation of Insurances and on the Decimal (comacre. The following are the titles of a few of his worlis: lilements of A rithmetic (1830); Llements of ilipetra, Prominary to the Differential Culculus (1533); Elements of Trigonomatry aze Trigonometrecal inatusis, proliminary to the Differential Calculus (1837) ; Lissoly on Probelulities, and on thein Applamtion to Life Contimpencirs amb Insurance Offeces (1838); Formal Lomic, or the Calculus of Intirence necessary and probahle (1847) ; Arithmetient Books, from the Inzention of Printing to the Present Time, beint briof notices of a large mumber of worls drator up fiom actual imspaction (1S47). Te M. is also the author of the treatises on the Differential and Intiogral Calculus, pmblishel by the Society for the Dillusion of Useful Knowledme; and contributed larcely to the Peamy Gycloqueliat. (He died Mareh 187I.)

DENO'STHENES, the meatest orator of freece. and indeed of the ancient wonl, was a mative of Athens. The rate of his hirth is doubteul. Fynes Cliuton assigns it to the year 2S2 rec. : 'Ihirlwall and other sood anthorities, to the year 385 b.e. Ilis father, a wealthy manufacturer, died carly, lenviner his fortune amb chilhen to the care of there guardians, who crmelly abused their trust. As som as 1). came of age, he resulved to prosecute at law these unfaithful stewards. He gined his casp, lout mach of the property had heen alrealy squadered, and he only reenvered enough to save hin from poverty. His success in this and some wher eivil canses fixed lis resolution to levote himself to [mblic life: and he set limself to master the law anul politics of his comtry with a labomr annl perseverance almost without a prarallel. Ilis tirst care was to conquer the physical ilisulvantages under which he laboured. Tis health was naturally fecble, his voice harsh and tuncless, amd his action morrucefnl. To strengthen his lumes, ho nsed tw clinalostep bills, reriting as he went, or drelaine mo the shores of the sea in stomy weather. To impore his lelivery, las tow instructions from Satyrus the sutor, and din mot even dishain to stuly effects lafore a mirror. Ilis fedeleness of lealth ho never finirly wferanac, lint he obviated the defecto of his ably trainiur ly the surerest sturly pursuad for munthat a time without an interruption.
I). Lirst berem to take prart in phblic atlimes in the 106th olympint, when he was betwocm 27 amd 80 yours of ane ame from that time till his death, his history is the histury of $\lambda$ thens. "l'he states of Goroce ware at this tima miserably woak and divided, sund hiul recklessly shat thar eyes to the dine Was oron now making on thoir rommon libertins.

 ami unito their foress agatast the common enemy,

Whose crafty and crasping policy le exposed so nolily in 35\% B.c. in the oration known as the Pirst Philipric. Three years later, Philip lecame master of Olynthus, the last outpost of Athenian power in the north, which, in a series of splendid harangues -the three Olynthiacs-D. had implored his countrymen to defend. Jeace was now necessary for Athens; and D. was among the ambassadors seut to negotiate with the conqueror ; hut Macedonian groll lad done its work, and D ., as incomptible as be was cloquent, saw with desprair that Philip was allowed to seize 'Thermopyla, the key of Greece, and become a member of the Amphictyonic League. The peace lasted for six years, during which Philip's incessant intrigues were exposed and denomed liy D. in orations hardly less remarkable for their bolitical wisum than for their matchless eloquence. The most important of these were the Secoms, Third, and Fourth Philippics; and the spepelies on the " Nisconiucted Embassy,' and 'The Aftairs of the Chersonese.' When war broke out in : 440 E. c., D. introduced several important reforms into the army anl nary, and shewed such jowers of vigorous inministration, that Philip was babled for a time. Tlie struggle was closed in $338 \mathrm{~B}, \mathrm{c}$. by the battle of Charonmia, which lail Greece prostrate at the feet of the Macedonians. Only once after that crent did 1. aplear on the scene of his previous trimphs. But on that aceasion he dehyered, in defence of his friend Ctesiphon, his oration ' For the C'own,' which the almost umanimous verlict of erities has pronomeed to be the most perfect master-picce of oratory that ancient or monern times have seen. Fschines, his life-Iong enemp: against whon this speech was delivered, was so overwhelmed hy it, that he quitted Athens, and spent the remaintler of his life in exile. In $3: 4$ r.s., I). was acensed of taking part in a revolt irgomst the Nacelonian domimation, aml thrown into prionn, whence he escaper, and tled into exile. The denth of Alexander the creat in the following yonr lrought a gleam of hope and sumshne to the Athenians; and I)., recallal from exile, was again at the heal of atfairs. Once more the power of Macction prevailed. J). was demanded up loy the conquerors. Finding bseap impossible, the bunted orator sought an asylum in the temple of Neptume, in the island of C'alaura. Defore his mursuers overtook him, he had died, as was gemerally believed, of poison adminis. tered by his wwn hand. His death took place in :ine me.
'I'le personal character of 10 . is one which it is scare ely fossible cither to paise or to almire too mu h. "llis damatless limvery, the stainless purity of bus pmblic and private lifa, his splemdid and disintomested patrionism, and his servies as a statesmam ami ahministrator, antitlo lam to a plowe amoner the highest amd nolokest amen uf antiguty: On his morits as an orator, it is hamdy meressary to dwell. Sullime it to say, that the intelligent of all ares subseguent to his wwn hate with seareoly a dissentient Vober assismal to lim the hionest phere. Homer is mot mane elatily that prince of ancient punts, than is 10 . the princo of amement orators. - lhe hest of the cathis mbtions of $I$. are those wf 'laylor and lariske, both now sumerseded by the more recent edition of lakker. lor a detaiked
 tiom on the filismence of the Aneients.

 battle of Pultowa, first fomblat athen at themin $\boldsymbol{r}$, afterwards renoved to 1), where be remaned for some time.

DEMDSTLR, 'Tmovis, a professor famme for
 writer, wat lurn at Muiresk, in Ahommonshime, abent the year 1ros. What the rank on momition of his family was, is unknnon; wr know, hwewn, that lae stndien at Combrider, and that whan he went to framer, which $l_{10}$ divl while get gomes in order to perfect his colucatim, le ropersinteri himself
 -utate. At laris, he ohtaned a professorship in the collome of beanratis, where he manifesteal a very yuarrelsmo tompre encuphe, it is said, atmost diaty in mone lrawl. Whe of these masemp distwonanes resulted in D.'s having to potreat to Binglant. To Prance, however, he again returned, bringing with him a wife, whom he hat marriod while in Eingland, and whan was very beantifnl. (rossing the $A 1 p s$, he oltained a seemit professorwhil at Pisa, drawing at Iandsume salary fur his laboms. Here, however, the infictities of his wife mared his frace; and he remosed to Boderga, wher he lecame professor of belles lettres, and where his wife completed her shame ly eluping with 'one or more' of his students. Poor 1). Secms to have bren f (nul of this wanton, for be took the tromble of attempting the capture of the facitives. He failed; anit died at Butri, near bologna, bith September 1625.
1). is the author of mumerons treatises, amons which may be mentioned the Mistorich Lichloninstime Cientis. Scotorum- io work in whiels his desire to magnity the merits of his conntry often indued him to forge the mames of persons and books that never existed, and to unseruphonsly chaim as Sotchmen, Writers whose birthplace was dombtinh, wr who wer" known to be natives of England, Wales, Irelami, am eren France and Germany; lut nowertheless, in spite of its defects, it is justly reckned a valuable ant crutite forformance. It was reprinted for the Jannatyme Club, in 1820.

DHMU'LCENTS (Lat, Ammaten, I soften), bland and lubricating liquil sulstances, taken by the mouth, for the purpose of soothing irritation of the mucous membranes, and promating the dilution of the hool, and the increase of the secretions. Themulcents are chiefly eompwsed of Starch (4. v.), or Gum (f. v.). or of substanees crmataing these, dissolved in water; sometimes also of oily matters, or the white of eggs, and other alhmminoms or gelatimons substances largely dilutel. The flecoction of althaca, or marsh-mallow, is a faromite finm of demulcent.
DEAU'RRAGE, in the law-merchant, is an allowance made to the master or owners of a ship, loy the freighter, when she is detainel in mont ly the litter beyond the specitied time of sailng, for his nwn emvenience. A certain number of days, calle 1 rmning or working days, are allowed for receivines and discharging cargo, and it is usually stipulated in charter-parties that the frequter may detain the vessel, cither for a specified time, or as long as he paldese, on paying so math fer dicm for owertime. All the ordinary eanses of detention, such as mort-remulations, the ciowitel state of the harbome, iund the like, are at the risk of the freighter, and demorrase must he paid, though it he prosed that the lelay was incritable by hin (Comment(trex, V. i. 421 . Nhaw's ed.). '1n short, says 31 r focll, "the rule is. that during the loading or mondo ing of the ship, the merchant runs atl the risk of intermetions from necessary or accidental causes;

While the shipenamers hate the risk if all interruphons from the mumat the lemong on undording is completemi.' Dont dematrate is hat 'lan where the Whay arose from detention of the ship by a public anemy, or from hustile wecupation of the frot; and
 with the awners themselwes, on tha master, or erem of tha visel. 'Jhe remmraige cortsess as som as the

 contrant, and the ship is an aineal loyond them, the smu dhe ats draurraty under the crontrant will be taken as the buasum the loss fro the further time which may la clamed in the form of dimasers. It will be "pen, hawever, to buth jarties to shaw, that the rate thas lixed per dim is either tor hish is two low. Where there is no stipulation lugonl the onlinary acremont that the nsual time shall lee allowed for lowdins and undoatiog, the mastre will be entitled, when this perion expures, either to san or to claim lamage for fectention.

DEMU RRER, in English Law, is an exception by one party in a suit or action to the sufficiency in puint of law of the case of the opyosite party. Domurrers are in use in commen law an in equity. At common lene, each party may demur to the sufficmey of the ideading of the cipmsite 1 parts. The party whose pheading is demurred to may eithor anemi or put in a joinder in demarrer. leafrive argument, the pleadings are prepared in a particular furm, called the Wemurrer-bonk. A thmurser in quity, liko a demurrer in law, almits the facts of the case, lat states oljections to the form of the bill in equity ( $\mathrm{T} . \mathrm{v}$ ), or the sufliciency of the phintiff's ease therein disclosed, to sustain tho remedy cravol. It is a plawing the use of which is confined to the defendant.

Demmerer formence is also a form of procedure oxisting in both common law and equity practice. In the former courts, it is, however, almost olsonete: and in its place is sulstituted a mortion for a new trial (1. v.). It may arise on a trial at bar or at Nisi I'rins (q. v.). It admits the facts prownd, but orjects that they are not sufficient to sustain the issue. In ergnity, a themurer to evidence is where a witness refuses to answer a question jut to him tos direction of the court. The oljection is then tak in hlown in writine, and is argued before the juge by whom the interrogatories were settled.

Demerrer to "riminal indiefment is also alhost obsolete. After the passing of 7 (tom. 17. c. 6t, this form of demurres, which was fomerly of little moment, liccame of consequence to a prisimer, ims. mueh as hy neglectine to state in the form of a demurer lis ofjection to an indictnent, he was prechuted from afterwards insistimg in them, Ibit ioy 14 and 15 Vict. $c$. lor, it is enacted that no indictment shall for any of these deferts be helid insufficient: and further, that every objection for ony fomal wfect in an imbetment shall be taken before the jury is swom, and may he amemied by the judpe. This last provision places themurers in eriminal cases on a simalar footing to that of objections to the indictment in suintland. There is, howerer, this material difference, that in scutland the dufect camont lie immeliate]y rimelied. lont the prisumer, if the olfeetion be sustained, undergoes a further detention ju jal on a new indictmont.

DEMY', a 1 marticular size of 1 mper. In that of printinc-pajer, cach shoet measures 22 inches loy 17 $\frac{1}{2}$ : driwing-para, 2 by 17 ; and writing-paper, 22 ly 15.

DFNAN Aord, on the left lank of the schelat, about five
miles west of Valenciennes. Its situation, in the centre of an extensive coal-fied, and in the immediate ricinity of iron mines, gives it musual facilities for smelting iron, and its works of this kind are of considerable importance. $D$. is a regular and wellbuilt town, and has a good market. It has sume manufactures of beet-root sugar. Pop, 5714. Here the allies under Lord Albemarle were defeated by the Frenels under Marechal de Villars, elth July 1:12.
DENA'RIUS (deni, ten each), the mimeipal silver coin among the liomans, was equal to ten cists, but uron the reduction of the $a s$, the denarius eqmalled

 way. It is 11 mikes lome with ate average homadh
 ant, atem in the sixth in size of the Willa comentirs. 'The sutase is parly ruitel and montanmes, with

Whyd, 00 miles by 7 . In the north, is a horse-shoe range of hills. 65 miles long, and comvex to the cuast. The highest hill is cader Fromwen, 2.563 feet: and many rithers rise alove $]$ foll fect. The rocks are chiefly Silmian clay and graywacke slates, with some granite and trap, and bands of Devonian, Carboniferous. and Perman strata. 'Jhere occur coal, iron, slates, flags, millstones, limestone, leal, and copper. The chief rivers are the Dee, Conway, Eluy, and Clwyd. The Phaiah waterfall is ouk feet high in two parts. Llangollen vale is famed fur romantic beanty and verdure, amid hills of savage graudenr. The climate is mill in the lower parts, Gut cold and bleak among the hills, where small hardy sheep and ponies are reared. Nearly a third of D . is arable, and is highly cultivated; its com, cheese, butter, and livestuck are greatly estemed. It is also well timbered. Salmon are caught in the rivers. D. is divided into 6 hundreds, 3 poor-law mions, ansl lit farishes, in the dioesse of diamur and St Asaph. The clief towns are Denbigh, Wrexham, Iiuthim, Holt, Llangollen, Llanrwst, - bergele, and Ruabon. Tu 1S61, Pop, 100, S6: : churches, 341 Methodists, 171 ; Church of England, 76). D. returns thre members to parliament, two for the comty, and one for Denbigh. D, was anciently occuped by the Ordovices, a powerfnl tribe, wit entirely sulumed by the Romans till the time of Agricola. Uf British or pre-Tioman remains there still exist tumuli. two cistraens or stone cells, harrows, and forts. To the times of the Welsh and Saxon struggles are referalle the Pillar of Eliseg, near Llangollen, and the dikes of Offa and Watt. Otfa's, the king of Mercia's dike. to kecte out the Welsh, was a ditel, with small forts on momis at intervals, aud ran from Herefordshire to the estuary of the Dee, Watts like ran on the east sile of Ofa's dike, and parallel to it. Wrexham Thareh is one of the seven wonders of Wales. Chirk Castle is a fine Norman stronghold, lately restored.

DENDERSM (Cry. Tintyra, Copic Tentore. powbly from Ti-h-Ather, the abole of Athor), is mined fown of Upper Deyrt, sithated near the left Wank of the Nile, in lat. $20^{\circ} 10^{\prime}$ N... long. $22^{\circ} 40^{\circ} \mathrm{E}$. It is celehratid on acconnt of its temple, dating from the perion of Cleopaten and the carlier loman cmuruss, and one of the tinest and best preserred strinetures of the kime in Egypt. The principal temple mensures weof feet in leneth by about 50 in loreuth. and has a noble partico supported on If columms, 'The walls, eolmums, \&o., are coverel with tigues and licorglyphics. Prominent anomy the former is that of Ather or Aphrolite, to whom the thaple was elelicatem. On the ceiling of the purtico are mun rous mytholonical dimures arranced In zombiseal fachim, and which were lons recratided as a representation of the ganline : but the alnsime of the erab has led sente recent archacological travellers to donit whe ther the figures were inturned to have tay refernace to astronomy: The are many whor sacerd haldiness at 1 .. inchuling a temple of Isis. The whold, with the exceptinn of on proptom, are
 loner wh whe shan, and in some perts s.5 feet high.

brivilanl, sie Jons, an English funt of then roign of Charles I., was the son of the Chirf larm of Exchequer in 1relind, and was bom at Imblin in 1615. In I6:3, he antered Trinity Colleng. Cambrilise, wherc, after studyine three years, he took his degree. Turning his attention to literature, he wrote a trasely, entitled diohy, which in 1641 was acted with great applaus. it lhack. friars. Two years after, he problued the poem Comucs IIill, which has done more to perpetuate his nane than any other of lis works. In 16.t7, he was engaged in the performance of seceret services fur Charles I.; lut these leing disenvmel, he was obliged to escape to France in 16is, returning thence to England in 1632. After the lestriation, he was appointed surveyor general of his majesty's midilines, and createm kingle of the Bath. Finwards the close of his life, the latter part of which was darkened by an nufortumate marriatre, he was visited lay insanity; Lut recovering for a shart timu, he emmemorated the death of Cowly in one of his hapriest poctical performances. This own denth occurred in 1665. His verse is characterised by eonsidemble smonthness and ingenuity of rhythm, with here and there a passage of sume fince.

DENI'NA, Camo Growisin Marda, an Italian author, was bom enth February 17:3, at liow 21 l , in Piedmont; studiel at Thrin, amd in 1704 was apminted IFumaity Trofesser at Pimerolo, hat was deprived of his office on account of his haring written a comedy in which there was much that exeited the professiomal animosity of tha ecelesiastical urler. 1). Went to Milan, lint was som after recalled to l'iedment, and ippuinted l'mofosor of Shetorie in the university of Tiurin. In 1575, le publiwhed anonymonsly at Fhorence his $D$ hicorsu sulle' Jmpiego delle l'crsone. in which lee sought tu shew how houles might le transfomul into usefnl members of sucicty. 'Tlis, of comrse, ratan cont him his chair, and lie was eren hanislum from the netropolis. In 1782 , he went to limplin, on the invitation of Frederick the (ireat. Here ho livel for many yars, and wrice a considurable number of works. In Isot, he was intremend to Nopolewn at Mento to whom low dedicated his Clefors Lempurs (bere 1si4), aml was in conseluence armintol imperial hbrarian at Taris, where he deet Eth

DENIS, ST, accoring to tradition, the apostle of France and first Bishop of l'aris, suffered martyrdom in the 31 ceutury. Te was sent (as is said) from Fiome ahout 250 A. is to preach the rosiel to the riauls. After various detentions at Arles and other places, he arrived in Paris, where he marle numerous 1,roselytes. l'escennius or Sicinnius Lescemuius. Who was then the lemnan governor of this part of Ganl, ordered D. to be bronetht lefore him, along with other two Christians, Rinsticus, a priest, and Eleutheros, a deacon. As they continued firm in their faith, in spite of threats, Pescenmins causel them t. . he eruelly tortwed, and afterwards lwheaded, 202 A. I., or, as others say, 290 A. D. Gremory , if Tours. Fortunatus. and the Latin martyrologists, state that the bonies of the three martyrs Were thrown into the Reme, but taken up liy a phoms woman nanel Catulla, and interred near whore they lost their lives. At a later prevind, a chapel was bailt over their tomb. In G.b. Kince Dimhert founded on the spot an abhey, called st Denis, which soon grew to be one of the richest and most important in the whole kingrlom, and was long the sepulehre of the French kimes. What nacasure of trutb there may be in the above hingraphy, it is impessinhe to say. The Acts of St D., writteu alont the cond of the 7th or leginning of the Sth $c$, is founded merely upon ralyar traditions, and is full of alsurdities. The Greek Chmreh makes sit $D$. to be the same person as I iomysins, the Arepmaite, first Bishop of Athens. The liman Catholic Chureh celelrates his memory on the 9th of Oetoher. For a long period his nanse was the war-ers of the French soldiers. who charged or rallied to the words Montjoye st Denis.

DENBS, St a town of France in the department of Sieme, six miles north of Paris. It is traversed hy two small streams, the Crom and Romillom, and is well boilt, with dean spacions streets. It is situated within the line of forts forming the ontworks of the fortifications of l'aris, and was itself formerly fortified, fut its ramparts have been convertel into promenades. St I . has manufacthares uf printed calicoes amt other cotton goods; also several tour-mills, dyr-works, bleacheries, and Chemical works. Its yearly narket. at which there is an anmal sale of about 150, (ho sheerp, is one of the whest in France, and lasts for a fortnight. Pop. 1+1sis. The town is supposed ly sume to date from the foumation of a chapl raised athove the tomb of St Denis ( $4 . \mathrm{v}$ ). This chapel was ruphand, some time after his death, ly a chureh and abley, lmilt by Dusolent I., who was huri... in the ahory chn'eh, whim thereafter beam the mausolam of the kings of Franee. By a derece of than Natimal 'onvention in 1793, the ahber was fodered the destroyal, and in three days at tombes wrow surileginsly rilled and demolishad, and the bombes ant moliscriminately into ditehes propurd for thom. The mindine, stripure of its lowl to furnish lollate for the revolutionists, remainel rafless. and was nsul as a rattlemarket, mutid tho time of tha Bmpire, whor Napotern emmened it. resturation, a wank which was comphtent ing
 1t former splablowr. The eryit of the athery Whareh rontains statues of the brench king and

DENEDON, Joms Buman, Spaker of the

third daughter of the fourth Duke of Portland; representel Neweastle-under-Lyne from July 1823 to $1 S_{2}^{2}$, and Hastings from 1820 to 1830; was a Lort of the Admiralty from 1827 to 1825 ; sat for Nutts from 1831-when he was also retumed for Liverpool-till December 1832. On the division of the connty under the Reform lill, he was retuned for sonth Notts until 18:3. He was then withont a seat until 1541, when he was returned for Malton, but exchanged this borongh for North Notts in 1857. In May 1857. on the elevation of Mr shaw Lefevre to the zrearage, D. was elected Speaker of the Honse of Commons without opposition, and re-elected in May 1859. In person he is tall, and his deprortment is urbane and diguified. In knowleige of parliamentary practice, however, and the faculty of inspiring confulence in his decisions on points of order, he ean hardly be expeeted to equal his distinguished predecessor.

DENIZLI', a town of Anatolia, Asiatic Turkey, situated on a how hill rising ont of a spacious plain, in lat. $33^{\circ} 45^{\prime}$ N., long. $29^{\circ} 3^{\prime} \mathrm{E}$. D. is chiefly occupied with bazaars and market-places, the iuhabitants for the most part residing in the environs. The manufacture of leather anil a kind of morocen forms the staple industry of the phace. The popnlation may now amount to 8000 or 10,000 ; it was formerly much more numerous, but by an earthquake in 1715 , no less than 12,000 people perisherl.

DENMARK (Dan. Demmark), the smallest of the three Scandinavian kingdoms, is situater between 5 an $3^{\prime}$ and $55^{\circ} 44^{\prime} 50^{\circ} \mathrm{N}$. lat., and $8^{\circ} 5^{\prime}$ and $12^{\circ} 4 J^{\prime}$ E. lung., excepting the small island of Bomholm in the Laltic, about 90 miles east of Seeland, which Ties in 15 E . long. D. is bounted on the N . ly the Skager Tack, a gulf of the North Nea: on the E by the Cattegat, the Sontad, the Baitic, and Mecklonburg Schwerin; on the S . by the Elbe: and nu the W. lyy the North siea, which the Danes call the ' Western Oceau,'

 in the sonth, lat in the math the suil is in many pats aril. loinnan, the island moxt in extent, with an arra of about ! on squas: milus, is diviled from
 Little bedt. It is less woodme tham secland, and is intersected by a range of hills of inconsinerable height. The smaller salome of Iataml, Lamedand,
 milos, are crouped to the south of Wihmen amd Sombud, and exhibit the same physical and proufogical characters. They evidently, at some parlier "rnall of the worll's history, formed, thither with those two larger islands, ne connected whole with Jutland on the west, and Sweden on the east. The morth-east shores of Sjellam are seprated from the lathre comotry by a clamel 70 miles in length, and only $1 \frac{1}{2}$ mile in breadth at its narrowest point, known as the Some, or the Ore sumd, Sar Somm, so denominated from its resemblance to the human ear. This chamel varies from 10 to 19 fathoms in depth. The western coasts of Sjalland are divided from Fuhnen by the (ireat Belt-a chanacl ! miles wide at its narowest point, and from 5 to 2.5 fathoms in depth-while the western shores of Fithon are separated from the peninsula of Slesvic and Intland ly the Little Belt, which is about four-fitths of a mile wide. The peninsula of Juthand, whose area is about 8500 square miles, was anciently, and even comparatively recently, covered with forests, hat since their wasteful destruction, extensive tracts have become converted into sandy heaths, and in some parts it has been found necessary to sow hentgrass and phant shruls, in orler to prevent the mischief aceming to the enltivated lands ly the cloms of dust raised by the wind. Some fine beech and oak forests still remain, and the country is pleasantly diversified with wools and pastures. The Jutlanders are cither engaged in a seafaring-life or in agriculture, there being seavely any manufaciures in the ponmsula. The pastmes are extensive, ant good breals of horned eattle and of horses are rased, and larye numbers exported to Germany, liussia, and France. The sonthern prortion of the peninsula, comprising Slesvig, Holstein, and Lanenlom, with an area of 7200 square miles, contains large tracts of marshy land like the fens of Lincoln and Cambidgeshire, but the soil is very rich, and giedes excellent crops. Along the entire western shore, from the north of Jutiand to the Gemman frontier, the surface is a continual level, and has been retecmed from the sea; it is still exposed to inundation. and hence it is foum l necessary to motect it by embankments and dikes from further inroads of the ocean, and to dirain the fiches when muder water by wind-mills, as in Itollam. These defensive works are umber the management of a loard, appointed ly goverument, who prescrive regulations which the local promictors are obliged to observe. The eastem side of Slesvig and of the islands penerally, is skirtol hy ahrupt iunestone diffs known as filinte. Jutlanl is, on the whole, the least fertile part of the peniusula, and the contral portions of llolstein and Slesrig the most so. Intland is an integral portion of the monarchy. The luchy of Slesvig is an appanave of the Danish crown, lout distinct from it, and helit ly the soverign as the comntoluke of the province. Ilulstrin fell to the Danish kings at the same time with slesvir. Dut is a tief of the German empire ; and Lavenburg was made over to Demmark
in 1815, at tho morress of Vimma, in lien of a portion of lomerania.

The comets uf W., bothe on the continest ame in the islands, are indontal wilh mumems bays or fionds, the larest of whin is Lime lejorl, whinh intorsects Jatamb, and sime 1ses has insulated its mothern exfomity loy bowing throm the narmen isthmas which hail siparatorl it from the Nouth Nom.
 in small lakes, lat as mor inland Imme is more than :0 or 40 milas from the sea, and the ranese of hiths law and inturnptal, the chantry has mande rivers. 'lhe bithe, which forms the southern behmlary of the duchy of hatubure, weceres the inem-ind rable Hanish streams of the litle, Alster, Mtorer, and 1h.1. veman. The lanest river of D. is the Eyder, mavio crathe along nearly the whole of its comse, of alonat 150 miles. D. las fome laree camals-the siontir Holstein, and Kiel Camal, which comects the Nuth Sea with the fialtic, comprising a portion of the Eyder anl of Lake llembude, aml torminatrs in the kid Fjorl; the Stecknitz Canal, in the durhy of Lamenburg, which mites the Ello with the Baltic; the Taneskjohl Comal, in the islame of Secland; and the blensec (anal, ermecting the capital of Fulmen with the sea. There are thres lines of railway in W., viz. fron Commaren to Corsocr on the Cireat belt; from Altoma (ripusite Hamburg) to Kiel, with rarions hranches; am from Tonningen, across the duchy of sleswit, to Henshors. The public roals, alones which the mats are carrich, are well kept, and are under the manarement of the royal enginecrs.
(Himate, Suil, lrotuctions, \&e-The Tlimate of T) is moditiod by vicinity to the sea, and is comsider. ably milder, and the air more homit, than in the more sonthem and continental Germany. Tha cold is scldom rery intense much hefore Christmas, or after the midilio of March. The summers are occasionally very hot; the weather senerally may be characterised as yery varialle; rain and furs ar: frequent. The coll is the greatest in the nortli jarts of Jutland, and the least in the adjoining islamd The mean temperature in Comenhagen, whense climate may be regarded as representing an average of that of all D ., is, in winter, 329 ; sping. $4 \%$; summer, 6.3:5: antumn, 49\%, Fahrenluat. The altemations from winter to summer are rapid, aml scatery broken by the intervention of sprince or the succession of antum. The soil is prontaction, and it is estimated that more than half the promlation if 11. are engagen in agricultaral pursuita. The comal crops are gencrally grow ; the ambage ammal yidh of wheat, rye, harley, buckwheat, and prease, is reckoned at eioht and a half millims bondish quarters. Ahout half this quantity is exportell. The proluction of potators has been on the inemaso of late years. D. proluces abant ond half of the flax, and three-fourtis of the hons which it constumes. In Sceland, where alons froits and vesctables are cultivatel with any speriai attontion, the produee is remarkhe rather for quantity then
 exported. Cattle are reared chintly for the sake of the dairy promec, which constitntes the prineipal revenue of the farm; sheep are raised for the same purpose. Initter beiny made of their mill. The streams :unf fords abmond in walmable fisk, as col, horrings, salum, \&e. The tisherios form an essential hranch of natimal industry: the herringfishery in the direat lintt alone gives an annual pro-

Lirpmots and Imports. -The principal artirlas of

 lubles, tallow, lumethes, lish, train and whan nils,

 forshars, amb the importo to aloont is millions. Alonst

1 mats were, in 15.5 , about $7,0,010$ vessels, of about $\because$ million tons. The munder of Dansh merantile vessels, including freight-steamers, was in the same year about $2 ; 00$, which, with few exceptions, had been built in Denmark.
ficcerue, de-The estimated revenue for the whole kinglom, inchaling the duchies and dependencies, for the year endinis Niarch 1860 , was, in round nmmbers, $£ 2,900,000$, and the expenses were estimateal at mearly the same sum. The national dedt. in 1555 , was in rouml numbers it millions sterling, of which $60{ }^{n+1}$ cent. are held in Denmark. The somm dues, which sielded an important item t" the revente, have been recently abolished, in conformity with an agremment entered into by various mereantife mations to loy to D. a compensation fin their alolition. Sce Socso Dees.

The monetiny system of D . is now placed on a secure basis. The present national bank of $D$. at topenhazen, with branches at Aarhuus and Flenshorer was established in 1815 . It is anthorised to lut 20 million rix-lnilars in notes in cirenlation, amd must have half that amonnt in gold and silver, in the enrent cuin of the comatry, lullion. subreigns, de. acoorling to certain fixed prophtions, and must hole line por cent. securitios for the amomet of the depsits. The cums in cirenlation are gold Fradericles dur (1Ge 10h), silver specie-
 and skillinos ( 1 d. . . The rix-dollar is divided into 6 marks, of 16 skillings ench.

Army, Note:, de.-The Damsh army, on the peace footing, amounts nominally to 40,000 men, of which 10,000 are actually on serviee, and the remainder at the dispmal of the crown, when reguiret. The militia numbers about 60,000 rank and tile. Since 1807 , when Sritain deprived 0 . of the whole of her fleet and all her maval stores, the crovernment has been making strennous efforts to repair this severe loss, and 1. is now in bossession (if several tine ships of the lime, and a well equipued complement of smaller vessels, war-steamers. and gun-boats. 'The novy is reemited from certain of the maritime elistriets exempt from the liability of having to supply recruits for the army. The otlicers of foth surves are ubliged to receive their education in the royal colleqes, specially designed for them. The chiuf fortified ports of $D$. are Copenlagen, lianlsbors Glidekstadt, and Fredericia; and the mineizal fortress is lionbor: Castle, near LIsinore.

Ebluction,-- The ellueational institutions of 1 . have reacled a rory hish dearee of perfection, and fow eountries. if any, con compete with her in rearal (t) the +xecollanoe of the system, and its extensive arhioation mbatively to the amome of the populat tom. All en?natiomal institutions are manased by a roybl collent, wr loark, comsisting of three assessors
 to whom it repurts direetly: and with it rest all "plointments in thas miversity of ('openhagen. and all stammar sclumh in 11. l'ropre Education is pompalsory for chathen latwoen the ases of 7 and

Relegion. The estahli..ted religion of 1) is Iutheran, to which the king mast lubure fout complete tolmation is ajoyen in arery part of the lianglom. The reformation was introducal in $1 . \pi$ and when Clnistian 111. camsen all the homish hishome to be seized in one day, when their deposition from thoir sens was funally prochamed, and the property of the church incorpmated with that of the crown. 1). is divileal into ? diacests, on siftirs. hat it hats 9 lishoprirs (hesides thase in the West In lian colmics)-riz, soclam, Laakn, Jribhen, liln"。
 Irelami; I 907 parishes. with numermes :ufliliated churehes, 62 rectors, and 1675 parish ministers. The monination of the lishops es rested in the king ; they have nombitical character; lint inother respeets exrecise noarly the same privileses within their dinceses as the ir English lrethren of the same rank.
Lan--The supreme court of justice holds its sittings at Comonagen, anl there are roval courts in the duchies, and lower courts in the towns. All eivil cases ars first carricel before a Court of Conciliation, enmposed of persons from the vicinity, selected on account of their position and character. Their decisions are registered, and have legal fore where both parties have engaged to albildo by the jultment; otherwise, the ease is carriea to the higher courts. Apreals are allowed from all the lower conrts to the Supreme Court.

Constitution and Gorermment.-The suceession to the crown was not necessarily hereditary till lemo, when the people and the eleray, impelled by hatred tuwards the noldes, in whose hands the supreme power of the state rested de fiucto, constitutel themselves into a national assembly, which invested the sovereign (Frederick 111.) for himself and his heirs with absolute $\mathrm{p}^{\text {wower, and declaren the snecession to }}$ the throne hereditary. From that time, the crown exereised the dominium absolutum, uncherked ley any constitutional restraint, tili 18:3, when Freduric $k$ Vi., yielding to the pressure of the times, sranter a constitution to his people, and established an assembly of notables for the islands and buthand, the duchios being givencel ly their own constitntional forms. The nation was at first leerfectly satistied with the amount of power concedel hy the king, but after a time the anomaloms charactur of the powers vested in the assmoly were more fully understood; and on the death of Christian VII., lis son and successor, the present kine, Jrederick VII.. saw himself obliged to deprart from the conservative policy of his father, and to grant the constitutiomal form of government which D . now enjoys, and which is basel upon the most liberal principles. The pople are efficiently represented. and have a roice in all pmblic matters. The press is virtually free, and only answerable to law. The natonal assembly consists of the Folksthine and Landsthing, and is invested with very extensive powers: it meets ammally for two months, but the deputies are elected trimoally, and receive a fixed allowance during their sittings. Both branches of the assembly are elective and although the Landsthing lears some analogy" to the English Honse of Lords in respect to the sphere of its nowers, and its Iusition in regarl to the Lower llouse, or Folksthing, its members do not of necessity belong to the aristocratic class. Their number is in the propartion of 1 deputy for every 14,000 of the popation. The Holsteju-slesvit differences have. since their outlreak in 1515, been a somree of perpetual national disturtance. and have leen made the subject of

 was，homever，cramped in every direction ly the
arrogant nobles，to whose treasonable suynineness D． owes the reverses by which she lost all the posses－ sions she had hitherto retained in Sweden．The national disgraces and abasement which followed， led，in 1660 ，to the rising of the people against the nobles，and their surrender into the hands of the ling of the supreme power－an act known as the Aree－Eenvold＇s－Fegieriny＇s Alit．In 1665，the Fontre Lov，or law of settling the succession to the united crowns of D．and Norway，was drawn up，which has continned in force to our own times．For the next liumdred years，the peasantry were lept in serfage， and the middle classes repressed；while the power of the crown rested in the hands of a Germanised nobility，who despised the lauguage and usages of their country，anil exerted the most lancful influ－ ence on the true national life．Many improvements were，however，effected in the mode of administering the laws，and the Danish lings，althongh autocrats， exercised a mild rule．The abolition of serfage was begun by Christian VII．in 1767，but not finally completed till twenty years later；it was extended to the dachies in 1801．Struensee，the minister of Christian Vll．，originated many other reforms in regrard to freedom of the press，the abolition of monopolies，and of numerons abuses in the machinery of the state；and although these were checked for a time on his downfall，they were ultimately estab－ lished muder Christian＇s sun，Frederick VI．The miseries of this reisn，due to the relations main－ tained by D．with Napoleon，brought the conntry to the verge of rain．At war with Sweden，England， Russia，and Prussia，and with the finances in a depressed condition，the kingdom was threatened with bankruptey；and although it had speedily rallied from the injuries and losses inflicted by the battle of Copeuhagen，under Nelson，in 1801，the fresh rupture with the allies，which ended in the compulsory surrender to the English of the entire fleet，after the destructive bombardment of Copen－ hagen，September 1507，completely laralysed the nation．By the congress of Vienua，D．was com－ pelled to cede Norway to Sweden，in consequence of a previonsly existinis stipuation on the part of Russia to secure this important section of the Scandinavian territory to the Swedes，in return for the part taken liy the Swedish government against Napoleon．The discontent that had long been brooding in the duchies，degenerated after the stirring year of 1830 into mutual animosity between the Janish and German pepulation，which was not allayed by the schemes devised hy the court to mect the dinfilities of the case．The anticipanted failur． of lueirs to the thome eomplicated the questions at issuc：and the Holstein party，being encouraged by the diet at Frankfort，and perhaps still nore hy Prussia，came to an open rupure with D．in IS． 8 ， hiastemed，mo donkt，ly the reaction produced all wer the eontinent by the lirench revolution，and thus，on the acerssioni of the present kine，frederiek VIl．，halt his subjects were in open rebellion against him．After alternate hostilities and amistices，tho Slesvig－Indstein war was virtnally coneluded in lst？，by the victory of the Jomes over the slesvig－ 1 Holsteriners at histed，followed by the conclusion of pate lutwean 1）．and linssia．＇The liberal eonsti－ tution eranted by the king las fully satisfied his subjucets in 1）．Jroper，but disatection still smonhers in the duchies，where the question of the order of sucerssion is the principal obstare to an adjust－ nernt of the difformeses．The sulajeet lats of late
 of foreign powns，lint the result of the many nequ－ tiations to which it has given rise，is as yet fome 1sibl obsure ami inketnite．A further eonsidera－ tion of the priariples whel regulate the succession
in the duchies, must be defermal to tha articleg

1) E'NNJWITY, a sumall villase in the fro.
 west of Berlin. Ilore was foneht, win tha fith wi
 Saxons, and l'oles, eommamled ley Mirslal Ney,
 The tighting was obstimate to the last lurfrer. Jontlo armies more than whe drove ewh other from therir pasitions, but the patrintie emthusiasm of the: !rus. sians linally frevialdel, and Ney gave the omere to retreat. At this moment lammanter, aromp-pineq of Sweden, appeared at the heme of 70 hattalions uf linssians and swerles, suppontorl by 10,010 horss, ami preerded hy lino pieces of canum. These fresh troops turned the retreat into a complete rout, matil Hhe whale of the firench amy presented nothiner but a vast mass of furitives. The French lost li, 000 killink, wombded, and prisouer's (the Germans say 20,0(00), and 43 pieces of camon. The loss of the allies was 6000 killeal and woumled, of whone 5004 Wre Prussians. Ihe most mprotant feature of this victory to the Jrussians was that most of their troops were lenelucher (militia), for whom Niprolenn hat expressed the utnost contempt, cesimmating tlem a "rabble.'

DENNIS, Jomn, the son of a Lomdon sadiler. was born in London in 165J. Jle was pint to school at Harow ; and afterwards, in 16j5, he weut to Cians College, Cambudre. Fonv years afterwath, he removed to Trinity Ilall in the same miversity, and in 1683 , took there his degree of M.A. Aft'r. laviug Cambridge, he travelleil on the continent, passing through France anal 1 taly. Returning home. and in the possession of a small fortume, he joined the Whigs, and brought a suthiciently rancorous jen to the assistance of his party. Jle formed the acquaintance of Dryden and Wyeherny, and other distinguished wits of the time, aud instigrated loy companionshop, as well as by native beot, low maje various attempts as a theatrical writer. I). was expensive in his habits; and havines dissinated his furtume, he had to depeut for subsistence durime the remaineler of his life on private patromider and his pen. For several years, he enjoyed a small annmity procured for him ly Lord ilalifax, but that he ontlivel. He became blimd before hedied; and in his distress, some of those he had flattererl, and some of those he hat abusct. rgot up a pray for las lemelit. He died in 17.04 . D. had an mageremable tempre, and made many encmies; and his nane, which his own writings could not preserve, will heve for teve in their contempt and hate. IIe is one of the luest abused meu in Encrish literature. Swift lamponed lim, l'ope assailet him in the Essute on (riticism, and finally 'damned him to everlasting fanse' in the Dunciad.

Denon, Dommniqe Vivant, Balon, was borm at Châlous-sur-Saône, Jaunury 4, 1747. At an carly prriod, he went to l'aris, to sturly law, but quickly betrok himself to the fime arts, and acduiverl a hiph reputation as an amateru and art critic. Durinis a residence in Southern Italy, he suent much of Jis time in studying etching and mezzotint engraving. amil aloug with the Able St Non, wrote a Iomace Pithoratue de Japles et de Sicile (Par. 178s). Aftorwards, he lived at Venice, aud other ltalim cities, lont returnel to Prance during the lievolution. Ilavinef, at the house of Aabame Deanharnais, formed the acenaintance of Bonaparte, he was ehmen by lim to aceompany the expedition to dirype in the eapmeity of a vecent. lle was indefintigathle in hrawiug the relics of ancient Euyptian art. DENOUEMENT (Fr, from dinouer, to outip, which again is from nazul, a knot.) In lietion, this term is reuerally appled to the termination or eatastronhe of a play or romance; but, more strict!y speakiner, it designates the train of eiremmstances solving the plot, and hasteming the catastrophe. A somil lénonement in a noved or play should be natural, as a result of the preceding plot, and yet shmml wot be so olvinus as to be easily auticipated. Forecel and arbitrary solutions of jlot, ofteudiner asainst mature and common sense, aru fremently perpetrated for theatrical emect (eoness te the ditre).

IENE, Peter, a well-know loman Cathokic thendogian, was bom in ludo, at lbom, a small Belgian town, sitnatel on the river lampl, about 10 miles sonth of Antworp. Apparently, nothing is known-at least by Jrotestant writers-remarikin? the incidents of his life, as his name apprams in no encychnpedia or biographical work that we ar" aepmainterl with. The scanty information wo prosetss is derivet from the epintaph inseriban un his tomb, in the chapel of the archiepiscopal collenes of Malines by the present (1857) rector. From this epitaph it ajpears that he was rearer in thewlow at Nalines (somuthing equivalent to me pootessor of divinity) for twelve years, plebanus or parish pricest of st Jumolil's or Fumbohl's ehurch in the same city, and president of the Ciblleme of Nalimes for to years. Ke also helle varimes hemmary chureh riffices. Ile was cauon and pententiary, syowdimal examiner and selolastic archuriost of it linmoldis-the metromelitan chmelh of Indrimm. lle died 15 th February 1775 . in the Sosth year of has art. The work whith has rembered U.'s name familiar, even to the l'rotestaut public, is lis Theologit Wordis a Dogmulied. It is a syontrmatie expusition amal defence-in the form of a catechism - of every Ioint of ethies amb doctrine manatimed by Jioman Catholies, and is exteusively, if not Grucrally, admited as the text-bunk of theology in their colleges. It aprears to owe its furplarity more to its being a handy and usable complation than to any preat talent exhibited ly its author. The casuisticill parts of the work have ieen severely eriticised ly l'rotestant moralints. 'I"he edition we hatre consulted is the Dullin une of $15: \% 2$.

DENSITY. TVlen of two bodies of equal bulk or volume the one coutains more matter than the wher, it is sabl to have areater density than that other. The quantity of mater is masured hy the weinht. and thms density and suecitic oravity come to le propurtinnal to whe another, l'latima, which is abont $2 l$ times the weinht of water, lon: lassed fur the densest body; lat Breithanp of Freiburg, in

1S83, made nut irilimen to le twice as dense. Flare is "M1uscl to dense, and the rarest horly known is henfrumen. Which is about $1 \frac{41}{2}$ times rarer than atmuspheric air. The rensity uf lumies is timinishul by heat, and increased lyemht. See Heat, Matrer.

GENTA, or GYE'NTA, a market-town of IImerary, situated on the Burzava. alont $: 0$ miles someth of 'lemosvar. It has several large ammual tairs. Pop.

canine teeth, elongated, anl curved inwards. One species (I). ©ulforis), the Dentro uf the ancient Fomans, abomols in the Jethtermanean, and has oceasionally leen taken on the sonthern shores of Hritain. It is sometimes called the Four-toothed cijurus. It attains a large size, sometimes thrce feet in lensth, and 20 to 30 pouncis weight. It is an excussively voracions fish, as its large canine teeth might le hed to indicate, derouring other fishes; lut is itself in much reguest as an article of human foul, and sreat numbers are taken in the mouths of rivers in Walmatia and the Levant. It is there also a considerable article of commeree, heing ont in pieces, and packed in harrels with vinegar and spices, in which state it will keep, roon for twolve months. It was jreserved in the very same way by the ancients.

DENTIFRICES are substances, gencrally powters, which are employed as aids in cleaning the teeth. Charcoal and cuttle-tish bone-powder are useful as detergents; clatli, as a soft powder; and pumice, as a hard critty sulbstance for occasional use, when the teeth are more than ordinarily colomed. Catechu, cinchoma, and rhatany are employed to give astringency to the tooth-powier ; myrrh, to impart oblom; anit bole armentac, $t=$ communicate a red colour. Common salt, crean of tartar, phosphate of soda, and sulphate of potash, are oceasionally used; and where the breath has an unpleasant odour, the addition of $t$ parts of bleaching-powder (chloride of lime) to the 100 of the tontlypowder, remores the fatic character of the lireath, ind also tends to whiten the tceth.

DE'NTILS (Lat. dens, a tooth), in the Jonic, Corinthian, and Composite arders of architecture, are orwaments rescmbling teeth. See Extablatofr.

DENTINE is the thin layer of cement or enamel which more or less coats the teeth of the mammalia. and from the compactness of its structure and tino texture, it is generally callel the ivory of the tooth. It is very hard and clumalle, and consists mainly of Thosphate of lime accompanicd hy gelatine.

1. Dental simetry. The disumeres wherh the turtle are liable are those arisules from infaction
 structure irregularity of pusition, 丳: ; thasc, argin, comotituting diseases mon fropery so callon, shth as caries or dental decay, nectosso in doath of a thoth, indlammation or nouralgit of the soft tismes connected with then, such as the gem, the contral pulp on nerre, $\mathfrak{d e}$; lastly, those arisine from aceidents of rariwn kinds, such as blows, falls, and the like.
'Tho treatment of all these wifferent affections is grandally wi a local kime ; or, in other words, continal to the spos in which the disease manifists itself. But dental discases themselves are not always of a purely local mature ; and it may be generally stated that wherever a tooth beconucs diseased withnut any well marked or ustensible cause, such at torth has been originally defective or weak. It has been. in fact, imperfectly developed, and this imperfection is due to constitutionch causes, or such as affect the gencral health of the intivioual. In this way, a very slight cause is sullicicnt to excite disease in, and lead to the destraction of, such a teoth. Disease impairs what little vitality it already possesses ; it buomes less and less able to resist the action cren of such intluences as it is naturally exprosed to in the month-chemical decomposition is set up, and the substance of the tonth is broken down, ind decays - literally, rots away.

The objuct of the dentist, in these circumstances, is twofold: he either attempts to arrest the decay, and repair its ravages; or he removes the diseased tooth altorether. These oprations, along with supplying artificial tectlo when the natural ones are lust, constitute the main offices of dentistry.

Premising that all operations in dentistry require to be moditied accorline to difirent cases, we shall shortly describe the varions manipulations required in there performance.

Scaling. This is a little operation, ley which the accumulation of a substance termed 'tartar' is removed from the teeth. Tartar is a deposit from the saliva, and lodges in greatest 'fuantity most commonly behind the lower front-teeth. When allowed to accumulate to any extent, it causes absorption of the gums, wherely the necks of the teeth are exposed, and they becme loosened, and fall out. Its remusal is effecterl ly little hoeshaped steel instrmuents, bent in a manter to reach mure easily those situations in which the tartar is found. Their mode of use is by insertier the proint of any one of them umber the free elge of the mass of tartar, at the gum, and lifting it iway from the hacks of the teeth to which it is alherent. The teeth are then freed from any particles still sticking ahout them, and their surfice smouthed hy leeing ribled with pumice-powier or chalk.

Repulating. - The teeth of the secomb, or jemanent or aidult set, are very liable to be crowded amb misplaced, whe overlapping the other, or those of the uprerfaw fallinir luehim those of the lower when the month is chosed, thas prodncing the prominent comdition of the under-jaw denominated 'underhung.' To remedy these defeets, a variety uf means have been mopted ly dentists; the principle uron which all of thein act, however, being
that of pressing the disulaced tooth or tecth into that "f presing the displaced tooth or tecth into the natural position. This, of course, requires that
rown or spape shoult wist for them to be thas aljusted; and where this is mot the case, the usual prowhere is tor mone onte wore of the hackCeth, of thase which it is lass lusimble to promere. On mattors lowing thas preparchl, a plato or frame is titted to the sums and remanmin tonth, and fix...d there in the sump manno as an artificial set of torth, and as shall iw desmibed in spaking of them. 'l"wn mondes are then at the dentst's dispucal for hringine the fanly tectle mon funition vio, tither
 - lastic huatures passed romal then in a maitable manner, and attarhed to the plate as a tixen fuint;
 means of shall wedges of dry woml instred lectwe ${ }^{n}$ the aljacent part of the plate and the tow th to be movel; so that wn the moisture of tho month cansing the wond th swell, it acts in this way with great torce Some considerable time is medessary to complete the rymation of mespaced tectle; and cwen after they hase assmond the prow maxition, they reguire to loe carefully maintained there, atherwise a tendeney to resume their fomer irregularity strul mamifests itself.

Stopying or Filling.-This is ame of the most impertime am? delieate oln rations the dontist has tu perform. The dirst step to he taken in fillimg or - vtufling a tooth, as it is sometimes callom, is to clear away all decayed and docayine snlistance. lour this purpuse, a number of shmer degrinf amp "xcolvating steel instruments, tomed "excarators," are recpuirel. With these, the hollow in the touth is scomed out and thomaghy clanch If pain he necasioned by this process, the oneration of chstroying the morve had better at unce he resorted to. 'lhis is yerformed in several ways. Where the tonth is single fangel, as in front-tecth, the merve may be lured ont hy pasing a slender broach, or syuare and pinted steel wire, up into the entral cavity of the tooth, with a slight rotatury motion. Whare this cammet be done, however, the best phan is to destroy the nerve hy some caustic apmbation, such as chloride of zinc. The method if doing this is to clean the tomith thomughly out, and then to aply a little bit of the caustic-about the size of a barleypickle or at grain of rice-pressing it well into the decayed hollow, and then lillmat it orer with soft bes-wax. This shomble allowed to remain there for six, cight, or twelve hours; it may at the end of that time be talien out, and the "thmpins moceded with.
The eavity being cleancel ont until its walls are of sound and hard tooth-bone, it is whe well dried, and the phy of stopmes-materinl insorten. Varims sulstances am employed for this purpose and the mode of nsiny each is somewhat different. Fur tempurary stuphines, $]$ me gutta-percha is a servise alse material. A quantity sufficiont to fill the cavity, and somewhat more, is to he wently warmed aver a spirit-lamp not in loot water-am when yuito phastie, is to lo tirmly pressed with a lhme printel stopping-instrument or 'phuger,' into all the interstices of the hollow in the tooth-mone amb more heing pressed in, until the suriace of the phes su formen is on a lewel with the surface of the touth, when all the supertlumbsurtion showh le removed, and the solid phug smontluy timished.

Another raricty of stonging-material consists of amalums of slifferent kinds. Dany aleurd statements have been made regartins the evil effects of amalqam sthprings, lut the only rowl iesalvantage attending thear nse is. that many of them get llack in the mouth, and liscolour the tonth, while those that do not get hack are friable, and crumble away in a short space of time. Thay are to be realily obtained, made ul, and mader varius names. Nons

## DENTISTRY.

of them seem very much superior to the common one of silver, tim, and mercury. The amalgan, then, whatever one it may be, is to be reduced to a firm. llastic consistonee, and carefully intronnced into the dricd cavity in the same way as described resarding the gutta-preba, and is to be finished off in precisely a similar manner.

Gold-stopping is an operation of a much more complicated and diffeult description. The materials used here are either gelld-fuil-that is, thick gold-leaf —or the peculiar sulistance, or ather the peculiar form in which grold exists, known as sponge-goll. In stopling a tooth with gold, even more care is necessary in prepmine the cavity than what has been alrealy incalcated. Its shape must now also be taken into acount, and the nomer it apmonaches to a eylindrical form the letter. 'The grold-foil, when it is cmployed, should be cut into strips, their brealth rarying accorlineto ciremmstances. Varinus montes of packing the ghld are adonted, the chief chject being that the foil shall lie in the arvity in such a way that its elges, and not its flat surfaces, shall be presented at the surface of the phag; otherwise the phas will be liable to injury by layers of it peeling off. In stmping with speneregold, the preparatory steps are the same as for foml. stopping; it is, huwever, moessary to be more careful that 10 moistme low allowed to interfere with the mperations.
'J'he surface of a cold phag, formed in either of these ways, shomld be well consolilated by hard pressure with a bhut phager, and the superfluons portion being removed, it onght to be bumished untal it assmmes a brilliant metallie lustre.

Lictraction.-This is the principal surgical operation falling to the dentist. It is most commonly lemamerl in consequence of what is termed tooth-ache-a disurder which, howerer, is not always rne anl the sane in its noturs. This want of uniformity in the nature of thase diseasel states to which teeth are stllject, and which are compre. hensively denominatend tonthache, leads to the conflicting results oltained trom those aphlieations recommenderl for its curc. The:e renkedics are numorous, and of varions rharacture. To explain their mode of actiom, and the particulas symutoms indiating the selcotion of ench one in 1 woference to another, would bere lee out uf place. 'Jheir intention, in gencral, is citler to destruy the netrons tibres existiner in a tooth, or to narentice and remder them insensible. Anomy those acting in the frmar manner, are such as ereasote, chloride of zime, nitrato uf silver, alum, tamm, \&e. ; among thase actimy in the latter monle are chlotofman, ladamm, ethot,
 nay be stated, that lefore pumeding lo extration of is tooth on accomat of prim, some of these milder
 avert the necessity for such an meration. There is (n) necossity for ileseribing the mothon of their application, further than to rwark, that in all easis the secenyel ravity shomla previnuly be well CHaned ont. otherwise the romoly rmpionel maty le alturather previnted from ravelang the sprit vilere it is intombed te atch.

 strmetion tu that partamlan twath for which each

those instruments employed for digging out the fangs remaining after total decay of the crown, and termed elevators or punches, are made of such forms as may snit various conditions in which these roots or fangs are fuund.

The great matter is, that cach tooth should be extracted in accordance with its anatomical confighration; and to accomplish this, of course, requires an intimate knowledge of the natural form proper to cach of these organs indivilually; without this, it is impossible to citract any tooth upon a correct principle. The tooth is grasped, ns far as the instrument can be made to do so, by that portion of the rout or finur which just emerres from, or perhaps which is just within, the socket; it is then loosenced, not exactly lyy pulling. but rather by moving it in a lateral or in a rotatory manner, in strict accordance with the respeetive character of fang possessed ; and finally, on its being thens detached from its commection with the jaw, it is, with very little forec, easily lifted from its socket.

Annestheties are employed in the extraction of teeth in the same mamer as for other surgical operations, where it is desirable to abolish bain. Ether and chloroform are the only agents of this nature whicl have as yet heen found generally fit for practical apllicatim in cazes of the kind. Other nodes of metucing insensibilaty, lucal or gencral, have been $p^{\text {mogosed }}$ from time to time, but one after another bas been alrandoned as unserviceable. All over the world quack nostrums are fouml for rendering this oneration lainless; these, however, do not demand consideration here, as liad any one of thenn afforded the least chance of success, it would lang ago hare been gladly welcomed and generally adopted ly dentists.
2. Hechunival Dentistry.-The manufacture of artificial teeth, and other matters comprehended in mechanical dentistry, involvemany subjects of which nu adequate or satisfantory idea can be conveyed by mere description. Juthing beyond a mere ontline of the materials employed, and the leading brocesses involved in this liranch of art, can be ©iven withont practical ilhastration. 'lue various comditions of the month requiring the adaptation of artificial tecth, range from cases where only one fuoth may le wanting, to those where not a single thoth remains in the jaw, abuve or below. Aceordinsly, artiheial tecth are spoken of as partial or complete sets-a partial set being one for either nuper or lower jaw, where some of the natural tecth still remain ; a cumplate set being one for cither jaw, where none are left, fr for buth jaws, when buth are in such ciremmstances.
'I'he simplest form of partial sets is what is termen] a pivoted tometh. This is an artiticial tonth tixed in the montl unum the fang or rout of one whose crown has boen losi by mecay ur otherwise. The mode of procelure is as follows: An artitioial tooth, as near as prossible to the colour and form of that to he whlaced, is sulected. "lohs artificial tooth may lo wither the crown of a natural lmman twoth corresponding for that lost, or ane make in imitation of t Jis. an it speries of puttery-ware, sul by a process mush tom lons for datitil in this place. Sinch mineral tinfh, as these last are termerl, are manafactured on an "xtensibe mothe, amd sold reinly for ase to dentists. A torsth of mither limel then lumg selected, is acenratrly tittod lor thon root romamine in the month,
 insertal intu the " ront the uther roxtremity of this erold pin being atituher to the substitnte touth - the whole is fixed in it, matural fusition, in a manner that renders bedection almut inamessible

Whare nore than one tooth is required, and
occasionally even where only wh is mernsury, a somewhat diflerent contrixinco is had reoonese to. What is called as "plate' requires to $l_{\text {w: }}$ littonl to thes gram and remaining teeth in so procise alld purfect a manner as to lio quite lirnly aml stombly in its place, ind to which the artilieid touth required ame snluserumtly fixal.

This 'plate' is frepremotly mabl of mild, silver, or platinmm plate, of the thicknoss of carl-bumrol, in which case, the mame of "plato" is meser] in its literal signification. but sump plates may low mand of wher substances Jexsides theser of gilla, sulyer \&r., such at the ivory of the walras, me tha hime fotamas's tusk, or what is more emmmon now, of
 tirst step in any of these proresses is to whatan an "xact maded of the grm and nther pats unm which the plate is to rest. This is olotamed ly introducing bees-wax, or gatta-percha, suftemel by previous luating, into the patient's montly, and prossing it forcilly upon those parts of which an murression is desined. On removing the wax or other substance from the mouth, Paris plaster is lumel into the mond thas proeured, and on its hardening, or 'setting,' this plaster-cast presents an exact conterpart of the gam. It is upou this plaster-momel that all the subsequent operations are performed in fitting the artificial set. The following is a very brief sketch of the principal steps in workine each of the three clusses of material allumed to als being used for these purposes.

H"alrus or Hippopotamus T'usk sits.-In commencing a set of this kimd, ame, indeed, of any kind, the surface of the plaster-model requires tis be Iambened, in order to render it less friblle and subject to ibrasion dming its use. This is generally done either by varnishing it, or boiling it in linseed ril, melterl wax, stearine, or the like. This beong Ione, a block of suitable size is cut from the tusk to be employed, and by means of dilhernt-shaynd cutting tools termed scalpers, it is carved until it fits the model accurately. 'The way in which its fitting is secured consists in paintinis the morlel m that part representing the gmm, \&c, with :ny common dark colour which will reman wet ; the block is then apphed to the painted surfice, and wherever a mark is left hy the colomr, it is ent away by a scalpor, and the same process repeated, witil. ly constantly doing so, the coneavity thus produecil in the block corresponds exactly to the comvexity of the model representing the pratient's gum. The bock is then trimmed and aljusted, accurding to taste and circumstanees: and is finished cither by carving mpon its substance the apparance of the teeth requirenl, or by fitting amel fiximir into it mineral teeth of the kimd already deserihed.

Metallic-plate Sets.- Where the franework lying npon the grm is to he of gold or silver plate, or the Jike, it is necessary to promue, besides the phastermodel, a metal one. This metal-momel is generally cast in zine, fun-metal, or some such material; and is counter-model of a softer metal, generally lead, is taken from this agram, so that i complete pair of ches is in this way procured. 'Jhe goll or other pliate, cut of a convenient size, is then stamped between the two metallic dies, and so made to assume the precise form desired. It is then trimmed, and any more debeate adjustinents made upon it, such as soldering clasps round those parts where it is to embrace any teeth remaining in the moath, and finally completed by having the individual artificial teeth iddud to it, and adapted to the comfort and convenience of the wearer. The mode of fastening the teetly to the plate is in one of two ways. Une kind of tet.th have a trabe extending aluing their whole length, and these are fastened by means of a
pin lixad to ibur plato, upon whinh tho tooth is sucural hy this gin passing up the thbe allumad to. The other limel are" prosided with shart platimmen pias, dixal in tha matorial of then tonth hememe its

The process ly which the voleanite is made to take the place of the wax, is too complex for deseription lore.

The foregoing description comprehewds most of the oprerations commected with surgical aml mechasical dentistry. For a more detailed accoment of them, as well as the discussion of many minor points comected with the smbject, we must rubrer to the numerons and leautifully illustratial works sjecially devoted to such matters, liatcely publiahorl Joth in this comntry and Anmeriea; of those Tomes' Dentul sumtory, phblished hy Clurchill, Lombon, Taft's oprontive Dentistry, and Kichardson's M/echmical Dentixtry, both published in America, duacre to be specially mentioned as among the latust and best works on the subject.

DEMTlTION, PERIOD OF (Lat. dentitin, the pruecss of teethias, from dens, a tooth). In man aml most mammals, there are two aistinct sets of tonth : one set which appears shortly after hirtly, and which are termed the millo or eleciduous teeth; aml a second set, which, after a few years, replate's these, and which are termed permament tectl.
In the homan subject, the milk-tecth are twonty in number, each jaw contaniay (from lufore hachwards) four incisors, two canines, and fump molars: while the permanent teech are thirty-twor in number, cach jaw containing fur incius. two canines, fonr premolars or bicuspids. ami six hallus. Anatomists are in the habit uf loriofly $1 \times \mathrm{x}]$ ensim: the mumber of the different kinds of terth in any mammal by what they term a slontul formulo, The remmanent teeth in man are represented liy the formula, $i \frac{2-2}{2-2}, c_{1-1}^{1-1}, P^{2-2} m \frac{3-3}{3-3}=32$, where the jetters $i, c, p, m$, stime for incisurs, canmes, premolars, and molate, and where the two terms in each momerator and in each dennminator represent the number of each particular kind of tooth in each half of the ulper and h wer jaw respectively. Is these formmle are of com. mon use in nuost works on zoology and compara. tive anatomy, we aste another example-that if the permanent tueth of the hors, whose formula is, $i_{3-3}^{3-1} c_{1-1}^{1-1} p_{4}^{4-4}, m \frac{3}{3-3}=44$; which signifies that there are on each side of both nypur and lower jaws three incisurs, ene camime fotr premolars, ami thre molars, makimes all 41 teeth.

For a genural lescription of the form and uses of those diflerent kinds ui teeth, we refer the reader to the article Durstios, Orgass asd Process of, where their special uses are noticed in reference to the digestive function: while the histary of their structures, de., is given in the article Teetu.

The following is the usual orler and period of apprearance of the milk－teeth：＂The fonr central incisurs nsually apperr through the gums about the Thl montli after birth，those of the lower jaw shewing themselves tirst．The lateral incisors uext ancar between the 7 th and loth monthe：thu＂ anternim molars show themselves about the lath month，and are seron followed by tho canines．which mually aplear luetween the 14 then and months． ＇I＇he pisterior molars are the bast and most uncertain 131 their timp of pontrusion，Whish may range from the 1 Sth munth to the earl of the 3 y year．Exemit in the ease of the ineisors，there is no definite Jaw as to whether the upper or bower tecth tirst apuear．

Alout the middle or end of the Jth year，the jaw－ hones have become suthiciently elngated to permit tha apmearace of the first true molar：and abont the same time，the central incsisos are replaced by the earresponding jermanent teth．The alvance if the permanent teeth towarts the surface of the sum canses the alsongition of the ronts of the temporary teeth，and thens facilitates their shedding：the crown falling off，and learing room fin the perwanent tonth whind it to come forwarl and supply its pace．

In the rephacement of the first by the seconil set of tueth，the following onder is olsserved：The midule incisors are first shed and renewed（usually when the chill is about eight years of age），and then the lateral incisoss（iperhaps a year later）． The anterior molars of the tirstset are then replaced by the anterior jmemolars（tlis usually harpuns abont the 11th rear）；and about a year afterwards the posterior decidnons molars are replaced by the sccond premalars．The persistent canines take the place of the deciduons ones in the 12th year；these being the last of the milk－tecth to be exchanged． The secombl nolars appear between the ages of twolve and a half amd fourteen years；and the thind nulars，on dentro sapiontiep（wisiom teeth），seldom appear till three in four years subsequently，and uiften much later．

The factory laws in Soglami remier it very important that we slunkl be able to determine the ages of nine and thirten in chilhren，hecanse before a chind is nine years ohd，it is illegal to empley it in factory－wnk；and until it is thirteen，it maty only low employed durines nime hours a day，Mr Sammers，a well－known dentist，hats shewn in his pamphet，the Teth a Test of ilye，cousidured with leferesce to Fuctory Chideren，that the twoth affiod a far letter test of age at this pryine of life，tham the stamdand of height which has been adngend lay the legivature for this purzerse．

 －whe of this farmi of hie correspond in importance
with the great physiological changes taking place in it，and with the dangers of derangement in the just order or symmetry of their development．If these diseases uften appear to be due directly to the cutting of a touth，it is lecanse complex causes of disonder have preparel the way fur a morbid change，which is realy to be developed into activity by a compara－ tively slight imitation．The princinal diseases of dentition are Hiarrhea（（ $1 . v$ ．），Cobyulions（q．v．）， voniting，and lydrocephatus，or tubercular inflam－ mation of the membanes of the brain，which are all apt to originate at this period of infantile life， and to coinchle more or less closely with the A．velomment of the first set of teeth．It is very doultful how far the operation of eutting the gum with a lancet，so commonly supposed a specific for the diseases of dentition，ought to be encouraged． Sometimes thore is evilent irritation，or even inflammation of the gum，and then the operation will probably at least ilo no hamm but the indis－ criminating inse of the ：$n \mathrm{~m}$－lancet，at the request of anxions but foolish mothers and nurses，is characteristic of a weak and erroneous routine practice，and must be derounced as an unwarrant－ ahk interference with the truly beantifn process by which the tooth is graulually evolved from its socket，in most cases，withont any suffering．The special treatment of the diseases of dentition is disenssect under the separate articles deroted to some of these diseases．

D＇ENTRECASTEAUX，a term of various aphi－ cation in Anstralasia，affirits one of the few traces of French discovery in that part of the world．It indieates an archipelago，a caje，and it channel．－1． The archipelago lies hetween New（Guinea and New Ireland，about lat． $10^{\circ} \mathrm{S}$ ．，and long $151^{\circ} \mathrm{E}$ ．－2．The cape，a headland in Swan liver Colony，forms nearly the south－west point of Australia．lecing in lat． $3 \dot{t}^{\text {a }}$ tas＇S．，and long．110；E．3．The chanel，an arm of the I＇acific，separates Brone Island from the sonth－ cast coast of Tasmania or Van Diemen＇s Lam．It is about lat． $43^{\circ}-25^{\prime} \mathrm{so}$ and long． $145^{\circ} 15 \mathrm{E}$ ，is 3.5 miles long，and varies in width from 3 to ？ mikes．On the side of the mainland，it is commected with the interior by means of the Derwent and the 1 Inon，commmieating through the former with Ilohart－Town，the eapital．

IOENUDA＇TLON is the removal of solid matter liy water in mution，whether of rivers or of the waves and currents of the sea，and the consequent liying lare of some inforion rock，The rate of abrasim depends now the velocity of the current， and the natare of the sulid materials through which it flows；these two causes equally affect the demsi－ thon of the abrama matter，for the carrying power of the water vorios with its selocity and with the wough of the prorticles．The beavier dentis－large stonss and grawel－are carrich short distances，and derosited generally in masses；the finer bartieles are conveyed wa by a slow corrent to preat distames， amd ratterad in thin liyers ober exhensive districts． All chrmsition，＂xeqpt in the case of showers of vokeanie ashos，is the sign of a sujuerficial waste
 extent，elsewhere，the wain at we point lecing equal to the loss at another．No now material hits been nsen in the formation of the sedimentary moks． The domaratation amd almasion of ignemas roeks powited the matwrials of the cerrliest strata： these in thoir turn were frepuently almadeal and redepusited，muler new combitions，and with tho semains of a burer fana and flora，＇lhas the ＂ronst of the ghow has mot actually inereased in thicknoss，for whomer it acepures elensity in one phace，it beenmes thimur in another．The changes
that have bofn effecten by dommation, ame the amonnt of matter thas tramsorterl, are diflienlt to image. In districts when falte weme the surface
 washed away: These fandos sometimes wemblerer several homdred spara mitho, and the dishorations, lad they remained unaltered, womld hate produred momatains with precipitons usarqumen of difthent heights, roaching wecasimally to a thonsand fout. Sut dundation not only levellow the surfues of the earth; in rurions with horisnotal stratitication it hats furmoed inegualitios, hollowing ont valleys of chnmation, and often carryins away the whon of the superticial strata, leaving monntains here and there which shew, hy the direction and sucepssion of their beds, that the strata of which they are composed were at one time contimons.
DLOBS'TRUEN'TS (Lat. de, from, and matmo. 1 olstruct), medicines which have tho poperty of removing obstructions, essecially in the Lymphatie sirstem ( $q$. ©.). The glants of the thorax amb aimbum ( 0 . g., the liver, splen, kilney, \&e.) as well as the lymphatic and lacteal indme, are subject to cularements, which were formerly, under a mechanical theory of disease, univerailly ascribed to costructions of their outlets, or of the vessels in connection with them; against all of these states, aleobstruents were employed with varying success. The favomite deolstruent remedins are mercury iodine, and bromine; hlisters and friction, with stimulating liniments, may be said also to have a like action in some cases.
DEODAND. A persomal chattel which was the immediate and accidental occasion of the death of a reasonable creature, was, by the law of England. forfeited to the crown, in order that it might wo applied to pious uses, or given to cion, as the term implies. The rule dill not alply where the instrument had been intentionally used for the purpose uf causing death, as in cases of murder and homicides. Blackstone traces the origin of the eustom to the popish paryers for the sonls of the cleal, aud asserts that deodands were 'designed in the hlimd days of popery, as an expiation for the souls of such as were snatched away by suden drath; in the samp manner as the apparel of a stranger, who was fonml duad, was applied to purchase masses for the goom uf his soul.' The more probable vicw is, that it origimatel in the natural horror which is felt for whatever las been the instrument of so dreadtul an occurence; just like the Jewinh law, that if 'an ox core a man that lee die, the ux shatl be stoned, and his Hesh shall not be caten;' or the old English law, that a well in which a person was drowned should be tilled up under the inspection of the coroner. Similar regulations are to be fomed in the legal systems of must nations. The law of deodand was abolished by 9 and 10 Vict. c. 6:?

Deobitr. See Celatr.
DEODAR, remakable as leing one of the pettiest states in the work, is a district in the north-west of Guzerat, which is itself within the limits of the presidency of Bombay. Containing only 80 square mihes, aut 2000 inhabitants, it is yet sublivided into as many independent commonities as there are villages-the whole being, for extemal purposes, under the gratuitons protection of the Eritish government. The principal village, bearing the name of Deotar, is in lat. "Ot $9^{\prime}$ N゙, and lons. $71^{19} 49^{\prime} \mathrm{E}$. The district was forced on the Past Initia Company in 181:, as havins become a refige of marauters.
DEO'DODISERS are ehemical smbstauces employed for the phrpose of absorbing or Jestroying the ourriftrous principles evolved especially from
decompusine ammal and bobetalde mather. They

 writers, yet it appears to lo. not inmently of ites

 limes. It is situated in thas someli-s. it fart of the: sulboresideney of the North-west lowneme on the talle-lint, whones flow the kone to tha Gianges, and the Nerlmbla to the Srabian Sera: that the territury of samon and combulda, withen which it is contained, is cmamen to the two principal hasius of Northern hudia. The falace is about half-way letween the better-known citiss of
 ast of the femmer, abd fl to the moth-west of the latter.

DEOXIDATION is the tornarmied to the process of withlrawing the oxyem from a combfomma, as in the reluction of the nature peraxid. of irm in the smelting furnaces to the combition of metallic iros. On the small scals, in experimental inquiries, the process of dapxiation may be carnad on before the Blow-ripe (q. v.), wher the inner ur verlucing ilame is essentially a dexidising one.

DEPARTMENT (Fr. $D$ prertomen), a term used todenote a teritorial division in Franee. Irevious to the Revolution, France was liviled into provinces: lout in 1790 Nirabean rose in the Constituent Assmbly, and leclared that, after having abolished aristecracy, it was neither convenient nor safn to preserve these provincial divisions. He alleged that they were too large, that they temed to concentrate the administrative power in the hands of a few, and that such power som becomes aristucratic of nocers. sity. He surgested, therefore, a minuter temitornal division, as a carrying ont of the pranciples of the Revolution. This expression of minion was follown $]$ by a decrea of the Assambly, dated Felmary 1 h . 1790, odering the abolition of the ohl prasinciad divisions ( 3.4 in number), and the ratistribution of the land into S:3 Departments. Dwing the year ? of the lievolution, these were increased to in: in 150s, the Empire consisted of $1 \underline{2}$ : : at the fall of Napoleon, of 130: and at present it comsints of s!! includins the three new bopartments formed low the anmexation of sowy and Nice. Uriginally, it was intended that the lewartments should in
 this plan dik uot suit the views of the lirst Comenl. who placel ower ench Jomartment a pefect, and a consil de ferficture. The bepartments were ayma sublimided into arrondissements, owe tach of which was placel a sub-pudect (whes-prifil). The hight of naming these functimanis was reserver to the chief of the state. This system if departmontal alministration is still in fore in lopane

DEPSTOTURE, a tern in Navipation, explaineal

 sootland, to le in dumbence, from the moment in catation, until it le finally decidul ly the 1lonse nf 3,onds, shombl it he appealeal to that ultimate trilnmed. As a sucurite for the inalment of the decree los the sefembiof, in the creat of his lomes fomst liable, the purbur is antitled to use ather labind tion (i. 以.) in Arestment (if. s.) on the elepembence. or deperding issue.

DEPMAL (Artocarmus Lakoocha), a tree of the same germs with the Bread-fruit (q.v.) and Jaek (q.v.), a native of the sonth of India, and frequently cultivated in the northern parts of that country. The frait is eaten, but is inferior to the Jack. 'The fince, like that of the Bread-fruit, is tenacious, and is used for bind-lime. The root is used for dyeing yellow. "The D . is a large tree, and its timber is ralaed for a variety of muposes.
Dephlogisticated AIR. See PhlogisTon.

DEPI'LATORIES, or IPPI'LATORIES (Lat. depilo, to pull out the hair), are chemical agents employed for removing superthons hair from the shin. They were extensindy used by the ancients, lat are now restricted in their employment to the face. and to the renoral of the hair from the scalp, in the treatment of certain diseases. The canstic atkalies and alkaline carths are gencrally used, and a good recipe is to mix tive parts of caustic or slaked lime, ten parts of carbonate of solli, ame forty parts of lard. 'The tersulphuet of arsenic (commonly known as orpiment) is oceasionally used, but its empluyment is dangerons, as any abrasion of the skin will chathe the arsenical compound to berin to act. I mixture of caustic lime and orpiment constitutes some of the depilatories to be purchased; and it is believel that the Tukish Fusma is comprisel of these ingredients. A very active and comparatively safe compound is a stroug solution of sulphuret of barium made into a paste with starch, when is inmentiately applied to the part from which the lain is to be removed, and is nllowed to remain for tive or ten minutes.

DEPLUT, as a military movement, is a spread-ins-out of a body of troops in such way that it shall display a wider front and a smaller depth than it did betore the deploying.

DEPONENT, a term in Latin Geammar applied to verbs having a passive form but an active signification. They are so called because they, as it were. Iny down (Lat. dyono) or dispense with the situtication proper to their form. Such verbs had all originally arctlexive meaning, like the midalle voice in Greck verbs; thus, arcreve', ' 1 detest,' means radically, 'I turu myself iway from.'

DEPG'SIT was a real contract of the civil or Ioman law. It was the simplest of all contracts, and consisted merely in the delivery of an article by une persm to another, to be kept without remmeration, and to be restored in specie as soon as the dejwsitor shouk require--Inst. iii. 15. s. 3 . Retum when required was the sole conntition of the comstract: and no olligation was incured by the depositary hat to excrese ordinary eare in preservatinn of the article. The cival law reconmised a distinction, as th the value which might In. remerneld by the repositor in case of loss. latwern the case of articles voluntarily delmositem, and thas: which came into the hanls of the dipmeitary by the mixfurtume of the wwer, as by fire or shipurem. In the lather case, double the valur of the attile might la recovered. There wate abos a opecinl provision loy the odict Nukter, crompmes midulurii, wherely shipmasters, innhow 1 ws, and stablemm were complleal to exprise bume than whary vigilance wer the gools of their rustumys and passumas.

Jhe prinempers of the civillan as to meposit have lued miversally athotal by malem nations. In

 mot hathe for lint laults, or for the" prishing or Ah matation of the thing deprestert by casualty on necednat.' 'Thw article must bo restored when
demanded, and failure $t o$ do this will involve the depmsitary in liability for the consequences. See also Erskine, iii. 1, 26.

Jeposit, in Euglish Law, is a hranch of bailments, which includes also loans, pledges, and letting and hiring. From each of these, deposit is distinet. It is defined by Judge Story to be 'a bailment of gools, to be kept by the bailee withont reward, and delivered accorling to the object and purpose of the trust.'-Story on Bailments, c. ii.

The chicf ynestions which have arisen in modern times relate to the amount of care which the depositary is bound to exercise. Judge Story lays down the principle to be, not the care whieh a man takes of his own affairs, but that which a reasonable heing would nse, and cites in support of his view the ease Doorman v. Jenkins, ii. Acl., and Ellis $2-0$, where a person intrusted with money placed it in his own cash-box, and the box having been stolen, the depositary was yet hed lialle for nerligence. So also with jewels or other valuables- the nature of the article implies extra care. Where, however, a sealed packet or lwell hox is repositad, the guestion arises as to the liability of the depositary. Erskine lays it down broully, that where such a deposit is made without shewing the contents, the depositary ineurs $n o$ extra liability. But Story takes a distinction, and states that if the depositary had reasomable ground to believe the contents were valuable, he incurs liability accordingly. The immense value of the timber-trade of America raises in that country questions as to the lialility of a landowner for timber left by the river on his gronnd. On this point, Story indicates that the smallest amount of liability is incurred. Whether or not the depositary may make use of groods left in his charge, is sail by the same author to depend on the particular circumstanees. If the article woukl benetit by use, then such use is allowable: but if injury were likely to acerue, it is not. If use is a matter indifferent, then the depositary is not entitled to the use. The admirable work of Story on Bailments is the best anthority on this suhject.
DEPOSIT, a term much used in Geology, to characterise those rocks which have been formed from matter that has settled from susjension in water. The materials constituting such rocks have been ol,tained by denulation, and their extent in one place equals the demudation in some other. Deposits are characterised according to the conditions umler which they were formed, as marine, lacnstrine, fluviatile, and so forth.

DEPOSTTION, the testimony of a withess set down in writing. Depositions are taken cither by a judere or loy a commissioner specially appointed by him for that purpose. The questions to which the depositions are answers are unally put by the legal represpatatives of the parties to the suit, muler the control of the eourt or commissioner, and the answers are taken down hy the clerk of court, or hy a clerk specially appointed for the purpose. If the compertaney of the yhestions or the ammissibility of the witnessis's be ohjected to, the oljgection must be stated to the court ir commissioner. The latter may cither dispos" of the objection at the time, or reserve it fur the opmion of the court hy which he was apluinted. It is a rule in the laws of evilence of all combtrins that the riphosition cannt be read where the withess might le himself produced, because his rat twimony is the lust evilenes, and secondary "vilenen is incer admissible. Where he is aleal, howewe, ur insane, or luyond the jurisdiction of the comrt, his inmasition then becomes the lest evidence, and may be rean in comet.

## DEPOSITION OF A CLERGYMAN-DE PROEUNIDS.

DEPOSITION OH A (ULELZ:YMAN. In Seotland, the minister of a parish who has been guilty either of immoral and scanlalons comblat, or of preaching or otherwise publishing doctrines contrary to the standards of the church to which he has declared his admorence, or of contmancionsly settine aside the antlority of the l'resbyterian chnreb-eourts, may be eleproserl from his buly oftice by the chureh-courts. By this means lie is deprivel not ouly of his ecelesiastioal ilignity, hut of the temporalities of lis lenetiee (stat. 1592, c. 11 is), and the lenefice becomes vacant, just ats if he were dend. He may, howerar be restome to the exareis: of the mivistry, and to his fusition ats a minister of the elurch by the Guocral Assembly, but he cannot, of conrse, be rustorad to his bumefien; and it is considered irregular that be shonld be so even by a new presentation by the patron, hecause the stigma attached to his character ly his reposition is likely to affect his usefnlness. Where sentence of deposition is pronounced by an mferior church-court, the julgment of which is reversed on appeal to the General Assembly, it is Leld that it had never lieen pronounced; bint if the seatence be allirmed, it takes effect from the date when it was pronomaced by the inferior count, and from that date the minister's right to the profits of his benctice ceases. Sentence of deposition canuot be pronomeed by a presbytery in the absence of the minister, excent liy the authority of the Guneral Assemhly. Seo Deprifation.

DÉPOT, in Nilitary matters, is a name sometimes given to a place where army-stores are deposited duriag war. In refereace $t_{1}$, the regimental system, however, a depot is the heal-quarters of the regment, the town or barrack where certain stores belonging to the regiment are kept, as well as the regimental-hooks and some of the men, when the resiment is ordered on foreign service. It is rarely that the whole streagth of a regiment is engaged in active service at one time; rescrve companies are kept at home, under the command of one of the oflicers. Either one or two companies are generally thus reservel, umber the name of dipme companies. They form a moleus where recmits are received and drilleal, and where the corporate existence of the regiment may le kept nl. The system has existed in the British aruy since about the year 182. There is an acting staif at arach depot, of which the oficers receive atu allowance over and above their ordinary daily pay. There are not as many dephts as jeriments, seeing that a small body of officers can command the reserve skeletons of many regiments.

DEPRE'SSION or DIP OF THE HORIZON
 is the amgle throngly which the sea-horizon appears depressed is consequence of the elevation of the spectator.

Let A lue a priat on the surface of the earth, I; a point situated in a vertical line from A. Let lisI be a tangent tos the earth's surface drawn from b; $\mathrm{B} h$ a line in the same vertical plave perpeudicular to AB. The angle hSIl is the true dip of the horizon to a spectator at B.

The true dip measured in mimnes is equal to the distance in nantieal miles of the visible horizon. Let $C$ lie the centre of curvature of the surface; then, since CHE C is right angle, the angle $h \mathrm{BLI}=$ HCA; and the minntes in this angle are the
nantical miles in the are All. To find this angle in minntes on mantical miles the muln is: Nultiply

'line trine dip of the horsoon, however, is not exactly the same as its apparent deprossions. 'l"he aplarent sua-horiznon is raisel abose its true flate by refirction thrmush an angle, which viriob accorts. ing to the statu wi the atmosphere and the relative temperatures of the air and water, the variation rangiag from one-tlind to oue-twenty-thiral of the amonit of the trux dip. "Ine rule commonly conplyyed is to diminish the true dip by absut one-fourtrenth of its amonent, to find the aplareat dip.

If $S h_{\text {re }}$ a stare or the sun in the same vertival flane with Alsil, and an mborvation of the altitale abowe the sea-lomizon be made by means of a sextant from the point $B$ (as from the deck of a vessel), the alplatrent dip of the larizon must be sulatracted from the onserved augle, in order to timd the altitude of the sum. Owing to the uncertainty of the amount of refraction, the uearest minnte to the dip given in the tables is usmally taken. The following talle gives a sample of the amount of the ayparent dip under ordinary state of the atmosphere and equal temperature of air and water. See linure's Pructice of T atigution.

DEPRIGATLON OF A CLETMGYMIN. In England, this may be either (1.) by a sentence declar. atory in the proper court, on the ground of attainder or conviction of treason, felony, or any other infamons crime, or of conviction for heress, intidelity, or gross immorality, m for farming or traling contrary to law, I aud 2 Tict. c. Io6, s. 31 : or (2.) in pursmance of divers peval statutes, which declar, the benethe void for sume nonfeasance or meylect, or else some malfeasance or crime, as simmy; tur maintaining any doctrine in derograton of the Fimg's smpemacy, or of the 'Thirty-nime Articles, or the Fook of Common l'ayer; for aeglectine to read the liturgy and articles in the charch, and to declare assent to the same, within two monthis after induction; for using any other form of praser than the liturgy of the Chareb of Larlami; for contiuued neglect, after order from the hishon' followed by seidustration, to reside on the beneficet. In these latter cases, the lientice is voin, without any formal seutence of dermation (Stephen's Com. iii. 37). A hishop maz be depmived of his bishopuic, lut cannot lie deposcal, as may be dome in the case of a Presbyterian clerganan, the character of is hishop, like that of a priest, being inndible. The tribunal by which the Eishoponf Clorher was slepriver in 1800 consisted uf the arehhoshop and the uther. bishops of the province; and this precedent having been establisherl, wond prohably be adhored to on auy fatace wocasion, autwithstanding that the arehLishop alone might have fall authority to deprive. -Crifuss Litues of the C'harch, p . Jon.
 first words uf the IButh paslm, which forms a portion of the laturey of the Poman C'athulic Church and is sung when the budies of the dead are committed to the grave. A tender achancholy prorvales the pisalm, which, Lowever, brightens up at the close muler the couviction that with God there is "plenteons redemption.'

## DEPTFORD-DERAJAT.

DE'PTFURD, a town on the sonth bank of the Thames, abont 4 miles helow London Brince, divided from Greenwich by the siver Favenshourne, a ereck of deep water (lipe ford), formerly fortable at the spot where D. Bridge now stands. It contains two parishes, st Nicholas' and St Paul's, the latter formal by act of parliament in 1727. St Nicholas' Meptford lies wholly in lient, but St I'aul's extends into surrey - the surrey protion being known as the Manor of Hatcham. Pop in 1861, 45.7 It , chiefly engaged in the Royal Depteord Dock and Victuallinis Yards, and in extensive private shop-hnilding and enginecring estahlishomes. The market-gardens of Deptfond are famons. The upper pration of the town is well built, and is a favourite place of residence fur persous chuared in busincss in London. U. forms, with Greenwich, Woulwich, Charltom, and a portion of Plumsteal, the parlimentary borough of Creenwich, which retums two nambers. The ancient lneororation of the Master and Brethren of the Trinity ILonse of 'Iepitford Strond.' fonnded by Ifenry VIll., has its hall at D., and also two sets of alms-honses. Queen Elizabeth, in 1581, visited Drake at $D$, in the ship in which be compassed the work.' In 1605, J'eter the lireat acpuired the art of ship-hmaldine in the dock-yard here, resinting at the manor-house of sayes Court, which John Evely h had previously ocempied.

DE1TRORD DO'G-YARD, as one of the royal naval establishments, is not so remakable for shinh huiding as for other aperations connccted with the fitting-ant of fleets. Thiere are five balding-shisone for finst-rates, three for frigates, and one for sloops: and there are two docks for frigates. The Victualling Estahlishment is an important place, employinp several hantred persons as othecrs, clerks, worknem, and hoymen. This is the chite dépot for victualling the home and foreign stations, and the marines: als, for slops and many of the newssaries for sement and for barack-stores. It is convenient for these phrposes in being near the metropulitan markets. The oflicers receive, examine, store, pack, beinsue, anl register the rarions stores, and transmit all their accounts to the Adminalty. Fior simplicity we call this collece tively a royal , lock yarl; hat the ship-1,nilding. the store-keeping, and the provisuning are the work of distinct establishments.

DEldert ISLAND. a member of the bampier Archipeclago, lies off the nurth-west earst of
 Though only einht miles in cirenit, yct it is. 1 , more than ine groml, wathy of motice. On it have heo formo sume curms specimens of native soulpture; am, rising with its ereenstonn rucke to a lacight of 511 fort almone the sea, it presents a remarkalale contrast to the low-lying shore of the auljacent manalanl.

DEPETY, mu whe excreism juwer which properly belones to andhur who hats placed him in his staml. 'The aqumintmont uf a duphty does mot frew the primatial from wandibility, wo the deputy is met an assignes. It is a enemeral rula, that no
 to do son in the commission ly whin he limself is apminten. In the rare cosess in which a deputy is cmposered tor apmint a drpmty, the latter is usually called a sulnstituti: Soe simbiff.
HE QUENCRY, Thowne a distingushed Finglish writer, was bom in Manchester, Awense 15, 17 Sib. Ilis fallum was it wealthy Manchester merelant, who, dying while his children were get yanme,

 wardy sent to the grammar sclaod of lath. Ite:
proceerled to the university of Oxford in I803, and remained there till 1808 . At the miversity, be made the acguantance of opium, which was ever afterwarts his dreal familiar. On leaving college, he went to resile at the bakes, and formed one of the cluster of literary lights which mate that region at the time so illustrions, and afterwarls so memorable. He left C'umberland in 1819, and in 1543 he cance to resile in Scotland, settling with his family at the sillage of Lasswade, near Edimburgh. Ite died at Eilimburgh on the Sth December 1859.
With the exception of a strange episode of his youth, described in the Confessions of an Opium. (ater, the heroine of which was, singilarly enongh, one of the 'waits of Womanhood,' De Q.'s career was alnost mitirely eventless. He led a lonely and a speculative life, and his writings are at once history and autulnography. He was perhaps, with the exception of his friend Professor Wilson, the most brilliant magazine-writer in this century of magraines. liverythincs he wrote, putting aside the C'unfissions, The Latic of Political Economy, and a bovel. which no one seems to lave read, or if real, to have remembered, is in the form of articles. Eron the Confessions themselves were amimally $\mathrm{m}_{\mathrm{mb}}$ lished as a series of articles in the Lomlon Mugazine. De Q. has written on a great variety of sulijects, and in a great variety of styles. He has written articles pervaded by homour of the most curnoms ani wovel kind, philosophical and critical articles distingmished ly originality and daring of speculation, and articles of the nature of prose-foems, which are unquestionably of their kind the most womlerful things in English literature. In point of imaginative grandeur, and music and sweep of sentence, the Siaspinia de Profoudin, and the opimn visions that close the Conferssions, are miracles of impassioned prose. De Q's works were lirst collectendad republished in America. Between the years 1s5: and 1859. Messrs ITogg and Som of Elinburgh brought out an cdition, foundel to some extent on the American one.
DERA, SA'T, the fluvial portion of Daman (q. v.), itself a compuratively marrow strip, between the Sulinan Muntains and the Indus, is, when duly imigated. simgularly fertile. It is so called from dere, a camp, which is a common element in the manes of its four chicf towns-Dera Deen Promah, Mera Futti Khan, Thera thazoe Khan, and Dera Ismail Khan. These places are all built on or near the right hamk of the lomens, in Afghanistan.1. Hera Deen Pmah, apparently the least considerable of the whele, has sutherem mach from physical calnses, having, in 1s10, been nearly destroyed by an carthynalio amed ly a simultamens flomil from
 the centre of a distriat whids produces catom, sain of varions limds, indign, sugat, ind opiam.

DIREY DAY is the second ray, the Wednestiay,
 Epsom in Surrey, in May, in the week succeeding Trinity Sunday. Upon this day, the most important on the list, and that on which the hest horses ran, the famous I'erby stakes, instituted by the Earl of Derty an 1750, and which comsist of 50 sovereigns each, are contemed for. When the dirst Deriny was man for, there were only 30 subscribers at 50 gumeas carch (with $\pm 05$ forfeit in case of nonstarters ) ; lont the mumber of subseribers is now so large, that the value of the stakes in 1861 amounted tu di.nno. The Derly Day is the great Eugtish halialay. To be present at Epsom on that occasion, Lomalon empties itself, amu proceeds to the Downs hy mondes of locomotion the most heterogeneons. Fior homs, a continuons stream of earriages, gigs, dogearts, vans, and velheles of every descripition, mover thmaltnonsly along the road to Epsom. Shonkepurs on that clay shat in their shops, the bonches of parlianent are lesertem, one-half of the arintocracy aprar on the eromm, people of every emmbitions arrive in comotless nmmers from all districts; and hage trains arrve every few minates at the station, briming thein thomsands, until the entire Jowns are covered with a vast moving mass. So great is the demand for comveyances on this ray, that sancely a horse can be hal either in Londoin or within 40 miles of it. At the Iberhy in 1561 , the conarse, which is a mile and a lanff in length, was gone over in 2 minutes 43 seconns-swifter fmming, by 2 seconds, than any hitherto linown on that comse.

## HETREVITJOS. Se Joymucta Bretures.

DE'RJSSIIIRE, an inlani county of Emglam, 17w twenty-first in size, lying letwen Vorlishime on the wonth and Jeiecsterslime on the sontl. Its shitp is triangular ; its sreatest length from north to south, rif miles; greatest breadtl, oit ; area. 10:0 statare miles, of which abose fthe are rither arable, in pasture, or in mealow. No Eneslish cmanty has such varity of semory. The northewest is werupiculby the south end of tho l'enime chain, caldel the llinh I'ala or lorbyshime llishlambs, compensed of carboniferons lianstone. 'This tract forms the: wateq-shaid betworn the 'Trment and Mersey, amd is mot sumpassed for rorgen and rambutic seenery b,y anything in Enoland: abomatine in probices,
 foot long-ind streams that oftom lowe themselves fore at ther amone the tissmos of the limestone hills.
 Jram tha l'eak tract, a ranuge runs sontli: another runs bo milus sonth-south-ciats. Uther ranges
intersect parts of the county. To the sonth, D. sinks into a fiat or gently undulating tract of new red sandstone, with some spots of magnesian lime. stone and coal, and beds of red marl and ryprsum. The chief rivers are the Trent-dividing B. from Staffordshice for 10 miles, and then crossing the south of the county and passing into Notting-ham-and its tributaries, the Derwent and the Dove, both of which rise in the region of the Peak, and flow in a soutb-easterly direction. Warm mineral slrings exist at Buxton and Matlock, and intermitting springs at Barmoor and Tideswell. D. is celebrated for metals and minerals-iron, lead, zinc, manganese, copper, coal, fuller's-carth, mineral caontchene and mineral oil, gypsum. pipeclay and chert for potteries, marble, thor-spar, and alalaster for ormaments, \&c. D. bas six canals, and is intersceted by many branches of the Mirlland Sailuay. In the north, the elimate is cool and moist, with fors, aml often frosts in summer. D. is more a manufacturing and mioing than an agricultural connty. The best soils in the sonth aro red, marly, fertile loams. There are many wools and coppices. 'The chicf crops are wheat, barley, and oats. D. has much permanent pasture, large dairies, and sheeppasturage in the Peak district. There are manufactures of cotton, silk, worsted, metallic goods, porcelain, and marble and spar ormaments. D. is divided into 6 lmadreds, 9 poor-law umions, and 140 parishes in the diocese of Lichfield. The chiof towns are Therly, Ashbourne, Bakewell, Jhxton, Clhapel-le-Frith, Chesterfiell, Belper, anil Wirksworth. In 1851 , pop, 296,1184 (in $1861,339,377$ ) ; 840 schools, with $37, Z^{-7}$ scholars: 776 churches- 250 being of the Church of Eingland, and 404 Methoklist. D. returns six members to parliament-four for the county and two for Darby. There are in the connty remains of so-called Jrud cireles, barrows, cromlechis, British and Jioman roads, lioman baths, and a Lioman altar at Haddon Hall. There are also ceclesiastical and monastic remains. Repton Chureh erypt is olfer than 874 . IIardwick Hall contains sonve furniture of Elizabetl's time, and some cmbroilery said to have been done by Nary Queen of Scots. Near Bakewell is Chatsworth, the magniticent seat of the I bike of Devonshire. Arkwright built his first mill at Cromforl, in 17\%1. Driniley was born at Turnstead; and Strutt, the inventor of ribbed stockings, at Normanton. (1S71-pop.iS0, $3 ; 38$.)

DERBYSIIIRE SPAT is a name given to the fluoride of calcium, or Fluor-Spar (ף. ₹ै.).
1)ELECCLÉ, a town of Hungary, 12 miles sonth of 1 rebrecsin. it is sitnated in the vicinity of several small lakes, from which, in the summer-time, aconsilerable quantity of soda is obtained ly evaporation. In one of the lakes. small lout very beatiful pearls ame fomuch. I'p. 5 :300.

 an oval shect of water in the sumth of Comberlani, and one of the most beantiful of the lakes of that county. It stretches south from Keswick, is 3 miles long ly 1 ! broad, 72 feet deep, and was feet above the sea. Its banks are rocky and abrut, aud behind them rise rocky mometaine, one of which, the C'at Bells, is $1+45$ fieet hish, and anouther, Lowdere, has a fall of 100 fect. This lake is an enlarrenment of the Derwent rivor, whirls rims throngh the lake in its course townods tha lrish Sea. into which it flows at Worlington. It has several wooled isles, besshes a renarkable flonting isle-a mass of corthy matter six feet thick, and varying in size in diflerent years from on acre to a fow proches, covered with regetatim, and full of air-lmbles, which buoy it on the surface of the water. D. abounds in tromt, pike, preh, and eels.

DERWENT'WATER, JAMES, LARL OF, One of the lealers in the rebelimen of 17 l , and the last land of D., was the deseendant of an aneient Northumberland family mimed liaddiff. Je was born in 1688 , educated in France, amd on the death of his fatleer in 1705,3 ), then in his 17 th yoar, returned to the seat of his ancestors at Dilston, in Northumberland, and assmmed the patermal titles and estates. On the ave of the insurrection, at the close of 1714 , warrants were issuch on suspieion against several gentlemen in the morth of Englam, and one, amoug others, against tloe Earl of D . ; but having been previensly wamed, he fled from Dilston, and found refuge in the cottage of one of his dependents. Ile soon afterwards collected a few retainers, and placed himself at their head, under the impression that the entire loody of the Jacobites cither han risen, or were alout to rise. From this period the histary of the Earl uf 1). becomes the Listury of the Rebellion of $1 ; 1$, which ended in the disastrons encomer at lreston, on which oceasion I . cemmlucted himself with the utmost heroism. but, with the most of the rebel leaders, was taken prisomer, and conyeged to the Tower of London. Haring heen imperchad of high treason at the openimg of parlianont, he was earried before the Honse of Loods, Felmuary 9, 1716, and, requesting time to prepare an answer to his accusation, was remitted till the 19th, when, beine taken for trial to Westminster Hall, he pleaded guilty, and threw himself ulon the merey of the king. lis appeal was

 a thormachly orjeinal peret. ITe axecels in luttiness of jdea, purity of sentiment, aml ricly vicump of langutre ; in fact, the latter quality at times manifesta itself in an oriental extravarance of imasery which the colder fancy of the West fails to alymeciate. D."s woblest, as well as his most pophlar vile, is his adfloms the the Ocity. It has lumen translated into Jumbish, Gemmon, and other Enropean langhares. His collected works wre lirst puldixhed at St letcrsburu in wols. ( $1510-1815$ ), and have latn oftan reprinter since.

DESACUUDESRO, the name of varions watera in Spanish Anerica, of which the chiti are it lake and two rivers. - The lake, situated in Aramenia (1, v.), meanmes: miles in lenoth, with on isperare brealth of tive, and sends forth the Usumo to the Pateific-: A river of the Argentine ('mperleration, supurates thu departments of Bau Lins anel Deuduza. It is, how erver, merely a winter torment, leing quite drine up in summer,- $:$ I river of Bolivia-tle maly strean of any magnitude that is wholly within its borders-issues from Lake 'liticaca, and, aftm a sonth course of tion miles, loses itsolf in the lamlocked lake of Aullagas, noar the town of (ormen. It is, without exception, the loftipst strean of any length on rither continent, for the eleration sif its sumee, not greatly execerling that of its montl, is 12. 846 feet, ur neirly :2! miles.

DESAIK 1)E TEKGOCX, Jotr 'MaliLs Antoine, a someral of the first Freneld repullic,
 17, 176s. After studybig it the mbitary school of Efliat. he was apmointed in lotio arde-de-camp to Prince Victor de broglie, then at the head of the army of the Rhanse. llase 11, distingrished himself foy his hasery, whin was at the same time
 the command of the arny of the libuse. mate D. Jis lientemant. and employed him in the most diflicult and dingerobe missions. Jn Marena's (r. \%.) famons retreat thonsh the black lorest dinines this year, 1., who emmmanded the left wing th the army of tho lhine inereased his alreaty geat reputation. The French by this retreat liad now retived within the linine, retianing on the risht lank only the fort of lichI. which D. was commissioned to deform. The fort was in ruins, and embld wot be well repraided lefore the approach of the Iustrians; nevertheless, lehind this imperfect defence I , resisted the Anstrian amy for more than two months, waly erpitulating in January 1797. when his ammmition was spent. His ereatest achievement, however, was the conquast of [1]er Esble, which he accomplished in 179! , after am eight months' campaign. Je was ineredibly fertile in resourees, and prosessed the power of wimning and restraming
the people whon he liad conquered, to a wonderful degree; his own soldiers used to compare him to Bayard, while the iuhabitants named him The Just Sultion. D. returned from Egybt just in time to take part in the hattle of Marengo, on the l4th Jume 1500, in which he was killen by a musketbullet. His body was haced-after lieing embalmed -in the convent of Monnt it Fernard. A statne las ineen raised in his honour in the Place Danghine, is Paris.

DE'SCANT, or DISCANT (Sp. discante), a term which, in ancient times, was given to a musical emmposition; also to the counterfoint or meloly which the singer (taking the miper fart), sung extempore to the tenor or bass. In modern music, the term is apllierl tu the part written for the voices of females or boys, aud is the same as treble or sojurano.

DESCARTES, Revé (Latinised into Jičates Chrtesius), the mame of ane of the reformers of philosophy; was born Mareh 31, l596, at La Haye. in Touraine. He was seut at the age of cight years to the Jesuit College at La Fleche, where he soon became distmgnished for his keemmess of intellect, and male great and rapid progress in languages, mathematics, aml astronomy. It was not long, however, before he locame dissatistied with the doctrines and methon of scholasticism, and felt it impussible to acquiesce in what had hitherto heen regarderl as knouledye. The first thing that he did after leaving college, as we are informed in his treatise on $M$ ethon, was to abandon books, and eneleavour to efface from his wind all that he hal hitberto been taught, that it might be free to receive the impressions of truth, wheneesoever they should come. In $\mathrm{p}^{\text {ursuance of his plan, he resulved to travel, }}$ and soon entered the army as a roluntecr, serving successively in Mulland and Basaria. As, however, the life of a soldier contributed little to bis main object, he ruitter] the army in 162l ; and after makine journeys in different direetions, he at last retired to Holland, where be prepared most of his Forks, attractel many disciples, and at the sane time became involveri in seweral learnul contwversies, especially with the theolurians. Although he loved indepundene, yet, in $164!$, be accepted an invitation to go to swerlen, addressed to lim hy Quen Christima, whodesired his lenrwed intercourse and instruction. This willingness to leave Ilolland Was partly nceasioned by his inxicty to uscape from the hustility of his enemies. Only a few montlis after his arrival at the court of Cuen Claristina, he died on Fehruary 11, 1650. Sixteren yuars later, his buly was lrought to Paris, and burical in the charch of St Generieve-hn-shont.
'lhe qrand object towards whieln D. directed his endeavoms, was the attainment of in him $\mathrm{I}^{\text {bidosen }}$ mical conviction. The way whereby he sobght to attain this end, is explained in the Diseonrse an Dethon (Jisours de la Mehohe, pmblished in 16.37 ), to which we have alremly referrel. This small, but extremely interesting and important treatisa, contains a history of the inner Jife of the :uthar, tracing the progress uf his montal drvalopmont from its commencement in raly years, to the puint where it resulted in his resolution to loold bothing for tras: until he fatl aseertained the gromals of errtitule. Tlus authom als, in the same tratise, explatins the primetical rulnes whereby he resolved to be grided while in this stite of siosipeneled belof, aml by the ohscrvande of which low bajed to arrive at abselate cortainty, if, innleol, it were at all attamble. 'The results of his inquisios, su comblucted, he exhibited mome partienlarly in his Medilationes de Irime Phitosondid
(Amst. 164]), and the Principia Philosophire (Amst. 16t1). In the former of these tratises, the indepeadence of his thinking is strikingly brought ont hy his commencing his Meditations with the expression of donlot with regard to all that had litherto bome the name of knowleite. After examininer thoronghly, as be thought, the gromms of certitule in the various departments of knowledge, he found one, and only one proposition that seemed to him to stand the test, and of which the truth conld not possibly be doubted ; that proposition was, that be existed. which he inferred from the fact of his possessing consciousness. He could not domht that lie felt and thought, and therefore he could not dondt that lie, the feeler, the thinker, existed. This relation lutween conscionsness and existence be expressed by the memorable words: Cogito, cigo sum. Insteal, huwever, of making the above proposition the foumdation of his philosaphy, by which he would have been lad into a direction similar to that of Kiant or lichte, he employed it only so fay as to ascertain from it the criterion of certitude-viz, that Whatever is clearly and distinctly thousht, wust be true. Amongst these elear ami distinet thoughts, be soon recompisel the inlea of God as the absolutely Yerfect Berng. This inea, le reasoned, could not he formed in our minds by ourselves, for the imperfect can never originate the perfect ; it must be comope, i. e.. pant of the original strueture of onr understanding, and implanted there hy the Perfect Being himself. Ilence, from the existence of the idea of perfection, 1). inferred the existenee of Goal as the origimator of it; he inferrel it also from the more nature of the iflea, becanse the inlea of gerfection involves existeree. Dut if crol exist, then we have a suamante of the previously determined groumd of certitule, for Coul the Perfect leing camont deceive, and therefore whatever our conseiousness chearly testities, may be inplicitly believed.
The most foneral furilanental principle of the 1 hilosophical system of D., is the essential diflerence of spirit and matter- the thinking and the extended suhstanees-a diference so weat, according to D. that they can exert monfinence mon each other. Hence, in amder to account for the correspondence hetwixt the waterial and spiritual phenomena, le was obligeal to lave recourse to a constant co-operation (concurisus) on the part of (iod; a doctrine Which gave rise sulsoquently to the system callen Oceasionalion ( 4.5 .), the principle of which was, that buly and mind lo not really affeet cach other, God lecing always the true cause of the apparent m* oceasional intlucuce of whe on the other. This doctrine recorved its complete development in the

## DESCENDANTS-DESRRTION FROM TIE PURLIf SERVIGE OR TAE GOUNTRY.

which is ealled by his name, that ath equation may have as many positive roots as there are chamges of sign in fassing from term tor tom, and ass mathy negative roots as there aro contimations of sign, and not more of either kind. He gave a new and ingenions solution of equations of the fourth alegree ; antl lirst introduced raponemter, and the rely haid the fomulation for calculating with pumers. Int sharwed, morcover, low to draw tonyontis aml numals at "wery point of a geonetrical arve, with the exception of mechanical or transefulental curves: and, what perhaps was his highest merit. he shewed how to express the mature and the propertins of every curve, ly an conation botwen two variablu corordinates; thos, in fact, originating Analuticul cirometom, which has led to the hrightest disooverins. D . was less happy in his cosmological exercitations, in Whieh he attempted toexplain the movements of the heavonly bories by rartices (tourbillons), comsisting in the currents of the ether which he supposed to fill the universe; a theory which not only then, lint cyen after the discoverics of Newton, mime a great mise, and found many adherents, lut which has lone ago been consigned to oblivion. 'The philosophical and mathematical werks of 1)., which are composed in Latin, were rublished at Amsterdam (9 vols. 4to, 1692-1701, also in 1713), and at l'aris ( $1724-1726$, in 13 vols. I2mo). Nore recently, an edition of his whole works has been published by M. Cousin (II vols., Paris, I8:1-18:(6).

Desce'ndants. Sce 凹ele, Collateral, \&c.; Succession.

DESCE'NT, Line of SWifitis, is that ly which a hody falling uuder the action of gravity, passes most quickly from one point to ancther, It is proved that, when the one point is ant directly over the other, the line of swiftest elescent is an are of a Cyeloin (q. r.).

## DE'SERET. See Utair.

DESERTT (desertus, solitary), a term nsed to denote any portion of the earth's surface which. from its barronuess, as in the case of the arid plains of Northern Africa and Aralia, or from its ramk exnberance, as in the ease nf tho Siltus of South America, is mifittel to be the site of great commercial and industrial communities. SIany numes, each differing in meaning to some extent, are cmployed to designate the desert-plains of different countries. The Desert proper may be sail to signify the vast sandy llains of Africa and Arabia; while the flats extending from the Black sica on the north, ant from Persia on the sonth, onward across Tibet and Tartary to the north-castern coasts of Asia, are ealled Steppes; those in the northern division of Sonth Anerica, Silvas or desert-forests: those in the other prortions of Sonth America, Llanos and Pampas; and those in North Anerica. Proiries or Saramahs. All these though widely differing in individual characteristics, lave in common the important physical features of wide extent and uniform general level. The Oases, which are oecasional spots in the desert where springs arise and where the waste is enlivened by the presence of vegetation, are usnally lower than the general level of the surrounding plain. The great and famous desert-ground, however, is to be foum in the OId World. A luge tract of eomparatively raiuless conntry stretches almost contimmonsly from the North Atlantic to the shores of the North l'acitic, thus forming a great belt of saud from east to west, along the whole cxtent of the eastern henisphere. Beginning from Cape Num on the north-west coast of Afrien, the Gireat Sohara, the grawd type of all desert-grounds, stretches away eastward from the shores of the Atlantic to the
banks of the Nile, its enstorn division being frequently callul the vesert of hiding. Crossing tho Nile, by the irmpation ant inmmations of which alone Egypt is preservel from subsidmeg inter tho Waste comblition of the survondinf comatry, the desert is again fomme intoposing a strip of hot sumb hetwont the night lank of the Nile and the western lumar of the Real tom, upon whose shomes nes rain ever falls. On the right shore of the fiat

The eanse of this extraordinary zone of parched land, and of similar smaller tracts in other parts of the world, will he best explained moler the head of hian.

DESWRTAS, the general name of thre rowy islands in the Athatic Oecan, situated to the someth. cast of Nateira, in lat. $82^{\circ} 31^{\prime} \mathrm{N}$. long. $16^{\circ} 30^{\prime} \mathrm{W}^{\prime}$. The sonthern and lirgest island is called Bugio; the centre one, Descrta Grande; and the morthem, Chũo. Hescrta (irante has a length of six mules, with a breadth of from half a mile to one male; Chato and burfo are only abont a mile in lometh -the latter ahout the same in ineadth, luat the former not more than a quarter. 'The l). are not inhabited, hat they yield considerable pasturage, and are visited at certain seasons of the yar liy fishermen and herdsmen.

DESE'RTION FROAI TIIS PUIBLG SERVICE OF TIIE COUNTRY is the crime of a man absconding, dung the period for which he is culisted, from the service of the army or navy. This crime was, by certain old statutes, made punishable with death; lnit now the punishment for desertion is 1 reseribed by the anuual Mutiny Acts, by 23 Vict. c. 3 and 10. any court-martial may intlict a sentence of corporal pumishment, not exceeding fifty lashes, for desertion, and may in adition awart impisonment for the period prescribel 1 , the:
 c. 4. s. $3 \overline{3}$, it is provided that deserters may ${ }^{\text {lo. }}$ marked on the loreast in gumpowler or ink with the letter D. This provision is omitteal in the Mutiny Act. I S60. IWernits deserting lefine they have joned their regiments, are to he talsm to the regiment nearest to the place where they wer" fond, but to suffer wo punishment exerpt loss of bounty. Inducing to desert was formory manishable by death; the inmishment has, by modern statutes, been commutad to meual servitude. it simply 'ahsent without leave', a lritish sollifer, besides undergoing some kind of punishment, forfeits. his regular pay for the days of absence: but if his non-a prearance involves actual desertion, he loses all cham to additional may, gond-condnct money, and pension. The nmaher if desorters from the british army is very great. In ohe particular period ef eight months, from Oetoher 1. 1sit.
 from the regnlar arny, and b614 irnm the militia; and recent experience points to 20,0010 as a probable yearly average at pesent. Hany experienced ofticers attribute the evil to the temptations of bounty, rather than to ayy other canse (sce lionsty): and alvise that the same amont of money shond be applied to the sellier's benefit in sonne wher form.

Desertion is equally a crime when committed by a seman of the royal nary as ly a soldier. A sailor absent from three suecessive musters is
a 'rmaway ;' and when discovered and bronght back, his funishment ennsists in a detuction of his wares. If his ahsence is continned, it amonuts to desertion. All harbouring of desorters liy other persums is pumishable. The year ISbo was marked ly great and scandalons elesertions from the myal nary; the cause is rery obscurely known, lint is generally referved to sone points of superiority in the merchant-serrice, which tempt the seanon away from their duty.

DESERTION OFSPOUSE. Pefare the ] assing of the Disurce and Matrimonial ('unt icts, there cxisted in Englaml wo moans wherely a wife, wilfully deserted by her husband, comal ohtain redress. liy 00 and 21 Vict.e. 85 , and 21 and 20 Yict. $e$. IUS, desertion ly either spouse is mate a groumul of judicial separation; and desertion enupled with andultery, is a ground for dissolution of marriage. The sane acts make provion for the protection of property acquired by a wife who has heen duserted. In an action for divorce on aceomet of arlultery, it is no biry to the action that the hushand has deserted lis wife. Murgan $x$. Norgan, Curtis ii. BSt.

In Soutlam, where the wie deserts the linsband, she forfeits her clam to aliment; lout in the event of her contracting lebt for mepessaries, the lusbon? will he liable in prament, maless he shew that the tranlesman was aware of the sepration. It is sat? that she may cham her lemal provision of terce on the lnsbami's death, though she have teserted him. A lmsband deserting his wife, continues liable to alimment her. It appears to be dombtful whether simpte lescotion of a wife by her hushanh is a gromm for judicial separation. But if either praty shall, without juct cause, have abandoner the comjugal sucioty of the other for fon years together, a secree of divorce will be pronomeed at the instance of the desurted sjomse (1573, c. So), Fraser On Domestic Prdulions, 4is, Gs0. See bivotee; SElafintion dULICIAL, OF IUAS AND WIFE.

DEAERTION OF TILE DIET. See DIET, DISERTION OF。

DESICCANTS, in Dedicine, are sulistances with antringent properties, whind are serviecable in thecking secretion aml exhalation.

DESTCCATION is the proeess of crying by the (mployment of leat, dry air, or chemieat asents which have an attivity for water. Examples of the class of dexirounts or drying subtances are fused ehlocide of calciom, quickbue, finserl carlnmate wt patash, amt oil of vitrinl. The latter is employed boy leine yated in a seprate rossel noar the sibstance to le dried, amblumber a lell jat.

Designing on wool for wook-cuts or enoravings is now a distinct lrofession, followed lyy a class of artists. A design of this kimd consists of a drawing in pencil on the wood, the effects leing as elosely as possible what the printed engraving is intemed to represent. See Woon-Exafiving.

DEsIGN, Governmext SCHugls of. The object of these schools is to commonicate to artisans aml manufacturers, and above all, to the designers whom manuficeturers employ in the preparation of patterms and motels, such an wuaintance with the principles and practice of the fine arts, as may be brownt to bear on mamfactures. 'llse illea of their fumulers was, that lyy trammer artisans in this mammer, greater symmetry of form, harmony and richmess of colom, and apmoriateness of decoration, might be given to the ordmary objects of everyday use whieh it was ther ocerpation to produce. The efiort was not in opprosition to, but in clirect acerrelance with, the principles of an enlightened ntilitarianism, for it was hoped that not only the direct and jrimary function of each object might thas be performed as well, or luttor, hut that it might lee mame to serve the inclirect and seconelary, but not less inportant oftice of retiving and purifyong pablic taste, and thus of allines to the sum of liman Lappiness. Even the ethical sille of the question was not overlonked. It was remombered that the good and the beautiful are intimately related, and it was hopal that mot moly anjoyment but virtue might he thus promuted. With these hirl olijects in view, a central behool of Design was established at somerset Honse in IS*7, mul hranch-schools lave since been opened in almost every town in the kingdom. 'Ihese schools are manared by the committee of comneil on Education, througls the intervention of the Department of science and Art, the offices of which are now situated in the Cromwell Roarl, Sonatl Kensingtom. In connection with the schools uf design, it was very soon fomd necessary to estahlish classes for clementary drawing, it being fruitless labour to attempt to teach the more alvanced branckes of art to persons who ware i,rnorant of its tirst principles. It was alse felt that, before a general hemand for goom lesigns cenld be erated, the large boily of the falhic, who form the purchasers, must be instrueted in the general principles of art. lmpressed with the necessity of in acyuaintance with elementary drawing for the incoomplashment of their ultimate object, and entertaming strong opioions as to its value as a branch of ereneral elucation, the bepartiment of seience and Art resolved to throw their drawing-s. hamls opren to the phblice, on the payment of merely nominal fees. These scloobs are now attental by latre mumbers of pursons of all chasses, and mothing can caceel the freejsion and accurary of the instrmetion which is commanicated in their elementary chassus. In the moner allyaned stanes, however, their pupils seem to make lattle pongross ; and the water-cobour pantings which they exlabit, both of flowers and landscapers, are interior to thase of many private shawingschouls. '['he following is an abridgment of the arrancements ly which issistanee in promoting the teathins of r]nowntary drawing, de., and in estab-

## DESNA-DESUETUDE.

mind was filled with lofty but confused notions of classical repmblicanism, which found vent on the pve of the Jievolution in his La Philosophie an Pruple Francuis (Par. 17SS), and La France Libre (Par, 1789). To his exaggeratel denunciation was owing that ontlurst of propular fury which resultert in the destruction of the Jastile on the wight of the 14th July 1789. In the events of the Champ de Mars, Augnst 10,1792, I!, like his friend Danton, tork a leming part, but was less implicated in the September massacres. Elected to the National Convention by the prople of I'mis, he voted for the death of Lumis XVI. Ilis rclation to Danton, which had always in it something of dependence induced lim to take ap the pen arainst the Girondists, aud iu his Mistoire des Brissutins, he covered these muderate repulficans with ridicule. In this, however, D. was not fuite sincere, for many of the Girondists he hindly estecmed, and he was hinself hy nature morls mone like Vergniad and Brissot than like liobespicere and St Just. When the guillotine was ercetel, D. sirw his error, and litterly repented lis facile folly. Towares the end of $179 \%$, he began to pullish Le Vicher fordelior ; a joumal which recommented, among other thinge, that the forms of justice should The restorct, and attacked the members of the Comitr de Sithat Public. 'Twice aceused lefore the Tacobin Club, he was at length, on the night of the 30th March 1794, along with Danton, arrested, and bronght hefore the Revolutionary Trihmant. When asked his age, D. replied: J'ai l'age du sams-culotte, désus, c'est-i-dire trente-trois aus, arge fatal aux réwhotionnaires.' He was combemned without a hearing, and mounted the scaffich along with Danton, $A$ pril 5,1794 . His wife, the leantiful Lucile Duphessis, vainly endearoured to excite an insurrection in his farour, and a fortnight after, she also was execated.-1). was trsentially an enthusiast and hereworshiper, always leaning for surport on some stronger spirit than his anm. His tirst hul was Miralbear, after whose death he devoted himself to Vanton. II is aspinations were noble his sympathies mammimoms, lout he hat neither sutheient moral resmution to "prose the pulitical excesses of the poplar party, nom even, mantil the chse of his carper, sutficient insight to assure him of their injostice and folly. Gifted ahmonatly by nature, as the light-hearted Canille Was, with wit. fancy, am feeling, one eannot hel, regretting that he did not lire in less troublons times, when he might have given to the worlh, in the form of poesy or tietion, the treasures of his rich and sparkling genius.

DE'SNA, a river of Jinsia, rises in tho envernment of smolensk, 50 miles south-east of the town of that name. It llows south-east throngh the anveraments of Smolensk anl Orel, until it reaches Priansk, where it anters the government of Telur nigne, through which it flows south, then sontlewest to the town of Tchernigov, and thally joins the Dnieper nearly opmeste Kirw. The D. is amo miles in leneth, and is narigable throughout almost the whole of its course. Its chief alluents are the Sum, from the left, and from the right, the snew.
 form of govemment which has for its abject the interestat "ither of an individual on of a class, in the "xclusion of thase of the whole commanity. In

and for whose benefit such a moverament is carried on. A despot may thus include any momber of persons, from unity upwards-from a monarch to a mob. Much of the confusion which attends politieal speculation, and many of the disasters which befall jolitical life in modern times, would? be ohviated, if these terms were used in the strictly seientifie sense which was assimed to them by the Greck politicians more than 2000 years ago. Swe Monafech. Tyrant, Dictatol.

DESSALINES. J.QuES, some time emperor of the island of Hayti (St Domingo), was imported into that islind from the Gold Coast of Africa as a slave On the liberation of the slaves, 4th lebrinary 1594, be became one of the most promment among the necrues who rose in insurrection against the white calmists. After the umanisation of the insurreetion, 1). ncenpied the position of first-hentenant to the leader Tomssaint I'Onverture; and in the wars against the Freuch troops, was always distinguished by his agility ami swiftness of movement, as well as hy his fearlessness and ferocity. D. submitted. however, and took alvantare of the ammesty granted on the eapture of Toussaint in 1502; but shortly after he headed another inswrection, attacked the French forces, defeated them in the battle of $s$ t Mark, and compelled them to evacuate the island in Octuber 1803. Ne was ereated governor in Jamary 1804, when the people of the island declared themselves independent, and had himself crowned as Emperar of llayti. Sth October of the same yeur, under the name of Jaques I.; luat his despotism and crmelty soon alienated from him the sympathy and support even of those who were formerly his firmest adherents. On the 17 th of Octuber 1800, I. was attacked and killed b,y Christophe, a negro chief, who succeeded him ais Emperin llani I. of Hayti.

DE'SSAC ${ }^{\text {r }}$, a town of Northeru Germany, eapital of the duchy of Anhalt-Dessan, is situated on the left brank of the Nlulde, not fra from its junction with the Elloe, about So miles by railway south-west of Derlin. I). is enelosed on three sides ly walls, the river forming the protection on the fourth side. D. consists of three prats, the old and new town, and the sand, and it has besides three suburbs. It is, in general, well louilt, and one or two of the struets are particularly landsome. Among the principal haildmgs are the dueal palace, a noble structure. mult in 1748 , with a plieture-gallery, and a harary, contaning many MSS of luther, a town-lall, in clemant theatre, and several chuches and benevolent institutions. Its edueational (istab)lishments are mumerous and excellent. It has a tine cemetery, and the envirus are smrounded 1 y beatiful sardens. The manufactures are woollen cloth, husimery, toloaceo, aml spirits. Pup. $14,00 \%$.

DE'SUETUDE, a termical term in the law of Scothad, sirnifying that repal or revocation of a lesal enactment whimh is rhectent, not liy a sulsequent chactment in a contrary sense. lut by the establishment of a contrary usi, sanctioned by the lapse of time aml the eonsent of the eommunity. The correnpmang turm in Phylish law is nomuser: but meither the word nor the ivea attached to it is fanilior to that system. The rule in Cugland is, that a statute onde formally macted by the legislature, remans in fore heworer maniled it may be to the alterad combitions of society, till it be repeated by another statute. The repal may be by implication, bat here the law watches wills a jealous eye. Anch r"poal 'is tobe umberstond,' suys Blackstone, 'only when the mattor of the later statute is so "henly repurnant that it noersanily implies a nega. tive. As, 1 f a tormer act any that a juror upon such

## DETACJMMENT- HETHOTT:

a trial shall have an ustate of twenty pounds a year; and a usw statute aftorwarls that he shall "have twenty marks-lure the latter statute virtually repeeals the former.' So far was this minciple carried, that it was furmerly the rulc, that if a stalnturepeal. ing another was itself refuablel atterwarls, tha first stitute was revival withent any formal werdes for that purposes. But this rule has hewn changend ly $1: 3$ and 14 Vict. $\because, 21,5$ s. 5 and 6 , which onnet that where any act repoalinn, in whol, or in part, any former act, is itself repealed, such last repeal shaill motrevive the act or provisions before repalel, ualcess Wurld be added for that purpose; and that where any act shall the made, repealing in whole or in part any furmer act, and substitutin! provisioms insteab of thinse repealed, such repeated provisions shall remain in furce till those substituted shall come into operatim by force of the last made act. In secutlana, an opposite priveiple prevailed, and it is still held thate an ts of parlianent male before the Union may lose their force ly disuse, withont any express repeal, on - Bo. into desuctude, as it is conmonly said. But by desuctule is meant sumething more than mere nom-use for a perioul of time, however great. There must be contrary use of a positive kinul, inconsistent with the statute, and of such a kind as to prove the altered sense of the community; there must, in shurt, be consuetulinary haw in a negative sense; and the sirealled desuctude thus amounts tor a zcpan of statute law by consue thilinary law. Fith ralles are liahle to objections. The result of that followed in Englant has been, that statutes have remainel mi the statute-book without formal repeal, after their enfurement had become morally implisille. Of this it may le mentioned, as one single example, thitt the judicial combat was formally temandent in virtue of an unrepealed statute, and hal in point of furm to be conceded in the present century. Sise Deer. In such eases, a virtual recumese to the principle of repeal by opmusite consuctule lecomes a matter of necessity, and the deficiency of the Euglish law iu point of principle is corrected in mactice ly the impessibility of alministering it. The Scottish principle, on the other hand, thongh far more philosophical and reasonable in itscli, scarcely admits of practical application; and the creatust ditficulty has consequently bees felt in determining what constitutes such contrary use as to suphort the plea of desueturde. The hest arrangement probibly wombld be, whilst retaining the Scottish male as correct in principle, to enteavomr, ly firging the statute-lowle of all olsolete cunct. ments, to render its practical application as limitel as possilule.

DETACHMENT, in Military matters, is a small but indefinite number of trons, sent for sume special duties away from the regiment, brigade, division, or army, as the case may be. In a fleet, also, a detaehment of one or more slipis may be toll off in a similar way.
DETERMANANTS, the mame given to a new methol of great use, inter alia, in the solution of equations embracing several unknown quantities, whereby the stulent can almost on inspection write down the values, in terms of the known quantities, of each of the unknown.
Wertinde, in English law, au action for the recovery of grods wringfully detainal, or their value, with dlamages and eosts. The action is for the rewvery of a specific article; the goods detainel must, therefore, be "if such a charicter that they can be distinguished from others, as a horse money in a lays. \&e. In this respect, the action of detimue diffors frum an ordinary action at law, and jallonent in detinut is acermpanied by its sprecial
romedy for enfurcing execntion-callell writ of Instringus. There must actually las a title of praperty in the phintill at the time he lrimps his action ; but property withont f"ssession is sufficiont, and an heir cin thas brine his action for an lanlow which hats nurer fewn in his pussession. This action was fomerly suljoct to Wayer of $L$ Lum (II. V.) nuw aloelished, wherely the defondant was allowel
 of when netighairs. 'This provecting rembernt thes action of ditime so ineconvenient, that, by a liction of law, renely for wrongful detnition was most frequmtly sought hy the action of $T$ rower ( (q. v.).

Devalobl, a town of North-we:tem fiermany, on the Werre, eapital of the principality of Eippe: Dht mold, 47 miles south-west of Bannerer, consists.s of an wh and new town, the latter of which is well mintt, and adorned with pmblic walks and wimh mis. The chice luildings are the paltace, at fine wh castellated ediliee surromaded ly prettily arramend gardens, the gymasima, and the theatre. II. has also a traimingschool, a pullic libary, amd as hospital. The manufactures are leather, woollens, and linens. There are also several breweries. Pop. 5232.

DETONATION is the phemmemon of commastion with explosive rapidity, accompanicl by sumat and light. Thas the firing of gunpwder, suncotton, and fulminating.jowlers, as in a percussiuncap, is iletomation.
DETRITUS applied in Ceolory to acemulatians formed ly the dismtegration of rocks, which consist of $\leq$ ravel, sand, or clay, or of in admixture of them.
HETROIT (1rench for strait) is that part of the St Lawrence which discharges Lake st Clair into Lake Jric. With a south-sonth-west course, it finms the lowest section of that mighty booly of waters hefore it assumes its north-east direction towards the gali of its own mane. It is ahout 2 S miles lone, with a minimm breadth of fully half a milc. Thounh the midelle of its length is bartly ahove the 420 parallel-about 500 miles to thic ssuth of any point in England - yet it is frost-1mond for abuat fom months in the yer. It is navisable fur ressels of any burdea, the ilecper clannol luing on the C'analim shore.
DETROIT, the oldest city by far in the west if the Unital States, and older than vither Daltimore or Philatelphia on the sea-b ard, was fomulel ly the French of Canada in IGFin, ass an outpost for the prosecntion of the fur-trade, on the right bank of the river if its uwn natas. For more thas a century and a lalf, howeres, the adrantages of its position were rather prospective than actual. Even under Amerieau impulses, the settlement of the aljacent wildernesses was so slowly carried into effect, that Micligan, of which D. was the capital, contimued to lie a subordinate territury, as distimguished from a sovereign state. from 150,5 to $18: \%$ Accordingly. as late as 1830, the [hace contained wnly 2 2se2 inhalitants. Put in 181", the 1opulation hall risen to 9102; in 1850, it was 21 , 169 ; and ly ia local census of 1 s50, it stoml at $34,4: 40$ and fianlly, notwithstanding the conumercind crisis of 16.7. the census of 18 fit wave 45.b19. 1)., or, in Latin, Bepontimm (whence thr mane
 classins here printen by a society of scholars in 1779), is not mentioned in history till 1197, and was then in the possession of Coments of Donx-1'onts. Atter various changes of misters, it finally came inter the possession of Bavaria.

DEVAPleAYAGA, a town in lmdia, remakal le chictly for its situation, stamb in the fork of the Alaknuma and the Bhamerecter, whuse united waters immoshately assume the name of Cames. It is in lat. $30^{\circ} 8^{\prime}$ N., and lome $75^{\circ} 39^{\prime}$ J, lelomging to the protected state of Curwhal : and its elevation above the point of conflomee is 313 , aml above the san, 2066 fect. Narkines, as it were, the somree of the saced river, D. is a favourite fhace of phigrimace
 pumbation consists of alowt 1000 Rrahmins from the lece:m. In comection with the laly character of the lowlity, are two ancient $t \mathrm{mph}$ es, a thight of stepes in the rosk down to the very lorink of the mingled stroams, aut three batoins excavated in the sndid stone a little below the level of the surface if the current. The tom was mols shattered liy an cortlomake in lous, hat was sulusequently repaired at the expense of scindia, the Malnatta chicf of (iwalior.

DHVELOFMENT WH DOCTRINE simnifes the momifying lrocess thrond wheh Christian or philosumical ipmon passes in its transmission from age to arge. At first comparatively simple in its expression, dectrine has a tembeney to locome more complicated and techucal in structure as argument is exercised upon it, and the spirit of controversy exated. The difference betwe the doetrinal statemonts in the Panline Distles and the earlior irmels, sueh as that of Nieate, the claborate expositims of the medieval therdomans. and argan of the 1'rotestant theologians of the leth and 17th centuries, is a difference at once aprociable by the theologian, as it is full of interest to him. There is, breyond innult, at these several points in the listory of the churels, a certain growth or extension of Thristim opinion called forth ly, and correspminis th. the exigencies of the times. This is what is meant ly the develoment of Christian doctrine and the name denotes with sufficient fropricty au muluesthmed suries of phenomear.

It is trow that the ingea of sewdopment in alocerine is one of momern origin, manown to the cather ingmatic ages of the church. Fint this mernly proves that it is suly in recent times that the histury of the church has been reviewed in a critical ame

 whind it is vimbation, in its almbination to 'hriutian

 alaptation to the highest forms of human civilisa. tion, and fall of whichtemment and wailance to the most adranced intelligence. The develoment uf

Christian doctrine, therefore, is not merely a sulbect
of curions and important study in the pist, but of great and significant influence for the present and the future.

DEVELOPMENT OF THE E'MBRY゙O. Harvey laid down the principle, in mposition to the views of those who believed in the doctrine of spon. taneous generation, that all animals are produced from egss (omne vicum cs own) ; and more recent rosearches have fully eontirmed this view, if we are allowed to except the monles of reproduction linown as ymmipurous and fissipurous, or multiplication ly buils and propagation by division, and the series of cases in which the otrimime never resmale their parents, but the original fom reappears in the speond generation, nul which are consequently said to present the phenomena of altcrnate generution. These exceptional cases ocen only in very low forms of animal life, amb, as a geueral rule, in retracing the phases of animal life, we arrive at an roch in which the incipient ammal is enclosed withim an ege. It is thea termed an cmbryo: amb the monifications which this embryo undergoes before the young animal has an independent existence, are included in the remeral term which stancts at the head of this article. Befne embryolney was proberly stadied, all mimals were arringed moler two great heads-the oriparomos, which lay erges and the rivipurous, wheich briner forth their young alive. We now know that viviparons as well as oyproves anmals are produced from eges-the only ditiurence in this respect being, that their egots, instean of being laid hefore the clevelomment if the cubryo, hegin to undergo their early changes in the honly of the mother.

The erge has conerally a more me luss spharical form ; the eross of hirds have, however, the form of an elongaten spheroil, narrow at ome eni, and henew the origin of the worl ocal. some cigs, as, for iustance, those of certain insects (e.a, the pulurella), we fumishel with pojectin" filaments: others have asculptured surface: and others arain, havepecnliar finms, bemy erlimulad ur prismatic. A simple spbere is. howevor, the normal form.

The egge originates within oryns temmel oraries, peculiar to and elameteristio of the female, except in those enses in which both male and fomale reproductive ormans are associated in the sume indivilual. 'These owaries are flamhular holies, and are usually" situaten in the abolominal cavity. So lonir as the Orgs manain in the ovary, tiney are very minute, and in this condition they are eallerl overiom or mimitime tws. 'They are illentical in all mimals, beinur, in fact, merely little cells, cuntainim, yolk sul)stance $l$, in which is anclased $\mathrm{th}_{\mathrm{m}}$ germimative wsicke $d$, nol the rommative dot e (lig. 1). The yolk itstlf, with its mombane, is formed while the erger remains in the" ovary ; it is afterwards enclosed in another emveloper, the shell. mombame, which may cither remann soft. like parehment, -r maty lee surroumbed liy cai-

maturity, leares the ovary. This step in the process is termed ovalation, and minst not be confunnded with the laying or deposition of the eggs, which is their sulsequent expulsion from the abdominal eavity, through (in most cases) a special canal termerl the oviduct. Ovulation takes place at a definite periud of the fear in most of the lower animals, and seldom watil the animal has attained its full growth. In general, ovalation is repeated for a number of jears consecutively, usually in the spring; sometimes, however, it ocours but once during life, as in most insects, which die soon after the process is accomplishen.

After leaving the owary, the eggs are either discharged from the animal, and undergo their further changes in the extemal world, or they continue their development within the boly of the mother, as is the anse in sume fishes and reptiles (as sharks and vipers), which have consequently been naned orovinipuroms anmans; or, in the case of the mammalia, they are not unly developed within the body of the motlor, fint, except in the case of the Marsupiata and Monotremata (I.v.), Lecome intimately mited to her hy the intervention of certain temporary structures-namely, the pacenta amd mobilical cord. This mode oi devolopment is termed gestation.

The develument of the embryo does not always take place inmmediately after the egor is lail, anil a consinerable time may dause before it commences. Thms, the first eges lainl hy the hird do not begin to undergo development matil the whole momber whibh is to constitute the eatire brool is deposited; and the erges of most insects are laid in the antumn, and remain unchanged till the following sprimg. Diring this time, the rital minciple is dormant. See Doranser Vitality. In the ease of Liods and reptiles, a emsiderable dugree of wamth is requisite for the process of derelopment. In birds, the act of me ubution, or 'sitting,' sumplies the necessary amount of leat: annl in reptiles, the eges are hatched by exposure on sands to the sun's rays, ly their being deprosited in warm dunchils, \&e.

We shall eudeavour to illustrate the composition and structure of the egrg hy giving an ideal section of a hen's egie (hir 2). ln a newly-laid hen's cgoand of course the description equally applies to the esif of any rother bind-we have exteriorly the sholl, whose hardmees is llue mainly to carbonate of lime, and which is lined lyy it donlile membrane, the shall momlranc. $c$; then there is an allomminous substane the white in which saroval layers may be distinguished, ? $f$; within this, we lind the: mall; $h$, enclosed in its mennlar:ano : mul in tha minst in tha yulle than" w:as, lufore it was latal. mimate: visicle, the it main. ntime resicle (tio. 1, 1) erobtrining a stili smallo. -The, the sfamimofioce dest, 5 'Thu' mast comspintoras of these parts-mambly, the shell amb the white-are not physiominally resontial, and are wanting in flu erge of must inmands lowar than birds ; while the foll, the suminative vesiche and the germimalive dot. ane fommel in the coes of all animats; and it is from thase prates, mad thase only, that
 monst essmatial part of the worm It is a riscid lluid,
sometimes opritue innt colourcal, as in the emers of birls, anf sometimes transparent aml ioblourless, as in the eges of many tishes and molloses. "Jhe microscope shews that it is composed of an acemmnlition of grambes amd oil-rosicles. Tho yulk is suroumded by a very thin skin, termed the vitelline membome (fir $1, c$ ). In smme insects, this memlnane forms the outer coat of the crats.
 in the young egg near the mildle of the yolk; it antains one or more minute spents or muel $i$, termed the perminative ents, $e$, which themselves rontain smallor nucleoli. The albumen or white of the cigy
 enogulates and becomes oprutue on the applieation wi it temperature of $140^{\circ} 1{ }^{\circ}$. Although it foms a lurge part of the egg of the hirl, it is nf very triflines inmortunce in reference to tha development of the malryo. It, is not formed in the orary Jike tle yolk, lat is sorreted liy the oviduct, amd deposited romal the yolk laring the passage of the eger through that canil; bence, when there is no oviduct, $\mathrm{tl}_{11}$ allumert is generally absent. In biris, it comsists of soveral lajers, one of which, forming the: chuluze, presents a coiled, ropelike appearance. The atfumen in this 1 mat is thicker thin that which lies more cxtemally. '1'ho albumen is bounded externally by the membrana putaminis, or shell memhrone, $c$, which, at $d, d$, splits into two layers, leavine a space, $b$, at the brond end, filled with air ; in birds, inm in some reptiles, this membrane is covered by the ealcareous shell; in most cascs, howerer, it coutinues membranous, as in the eges of the mollnses, most crnstaceans, and fishes, frogs, de. : and sometimes it is horny, as in the sharks and shates.

In oriler to understand the successive steps of ambryonic devolopment, we mast remember that the whole animal body is formed of tixsurs, the elements of which are cells. Sce Celas. While in the full-grown animal those cells lave underorone sneh modifications as often hardly to present any indication of their primary form ; in early cmbryonic life, the cells. which originate within the yolk, pescut a definite form and consistence. These cells we shall presently see become tranaformed into the Honot, bone, muscle, \&e. of the young ammal. At the commencement of the Inocess of develument, the yolk, which previonsly was a mass of miform appearance, sradually presents eertain alterations. Some purtions become more narque, and others more trunsparent; and the germinative vesicle, which was in the coutre, rises to the upper purt of the yolk, where the germ is to be formel. The yolk at the sume time muderenes a pecnliar process of segmentation. It is first divided into lalves, forming distinct spheres, which are again continuously and regnarly stibdivided into two, till the whule or a part of the yolk assumes the appearince of a mulherry, and is known as the 'mulberry mass.' In fishes, the class of animals whose development we shall specially follow in this article, the sermentation is only partial, the divisions of the yolk not extenliner into its whole mass. This process leals to the formation of a fyerm. which usually rises above the yolk in the furm of a discoid protuberance, which lats received the varions names of germinative lise. proligerous Tisc. cerminal membrane, \&e., and which is composed of minute cells. This dise cnlarges, till it embraces the whole, ne very nearly the whole, of the yolk. At this early periox, the grom consists of a single layer of very minute cells of uniform appearance (see fig. $\therefore, f)$; it som, however, increases in thickness, and in rewtebrate animals separates into various layers, which gradually bocome more and more rlistinct (tig. 4). 'The mprer layer, $s$, in this fignre is termed the scous on nerrous luyer, and from it are subse-
quently deviloperi the primipal argans of animal life
 The lowore layer, an, gives origin to the organs of vegetative lifio and apecially to the intestinas anl chylopoictic viscera, and is called the mucoms on veghatiow layor; the arills of which it is componsma aro larger than thuse of the serons layer. Jetween these layens there is, in the verteluata, an intermodiate: layer, $v$, zivine risce to the orems of circulation ame to the lirst-formed hinot, and lienne tumbed the ressular layer.

At a rory carly period, the urm unternes moti. fications of form, varying with the departnent of tho animal kincilom to which it belongs. 'Thus, in the articulatil (insects, custareans, \&e.), the ferm is divided intu segments, indicatinos the transverse divisiuns which ocent in the amblt immal (tio. 5);

Figs. :3-10.
while the xerm of vorteloate ammals dimplats a Iongitudinal furrow, marling the prsition which the vertehral colnma and spinal corl are to toching (fine 6). The thevelopment of this furrow is highly important, as will be seen by a reference to fics. 7 , and ! in which the eque is sipposed to loe cut tinonuly its contre, in a plane at right angles to its lome diameter, so that only the scetion "r cut surfan is shewn. while the riew in fig. 6 shews the whole course of the furrow as it extends over the yoll. At first, the furrow is wery shallow (fig, $7, b$ ), and a minnte transparent hand appears under it, called the primitive strite, $a$. The walls of the furrow consist of two raisel edges formed ly a swelling of the gem on hoth sides of the primitive strip. Is these walls increasc in hoight, their summits approach each nther, as is seen in fig. 8 ; and after a time they unitn. aud convert the furrow into a closed ramal (fis. 9), which is som filled with a fluid from which the hram and spinal eord are subsequently formel.
The primitive stripe is gradually doveloped into a cartilaginous structure, termed thin chorde dorsalis. which is the representative of the back-bone. In the meantime, the margin of the uerm continnes to extend over the surface of the yolk, until at length the latter is entirely enclosed in a cavity thas formed ly the germ. In this lower cavity, the intestincs and other organs of vegetative life are subsequently developect.

In all classes of the animal kingdom, the emproo rests uma the yolk, and covers it like a cap; lat the diraction by which its edges approach each other ami mite tu fom the lower cavity, is very different in difforent lifuls of animals, and is highly distinetive in reference to zoulogical classification. In all the vertelmata, the embryo lies with its face or ventral snrface towaris the yolls (fig. 19), and thus the suture or linc at which the eliges of the germ unite to encluse the yolk, ant which in mammals forms the navel, lies in front. Another suture is found along the lack, arising from the folding together of the upper surfaces of the germ. to form the dorsal canal. In the atlection known as spina bifida, this suture is
incomplete. In the articulata, the cmbryo bies with its lunk uron the yolk; in the cephalopena, the yolk cummmicates, as in the vertebrata, with the ventral surfice of the luody, but no dorsal canal is fonmed in them; and in the other inmartments of anmal life, we find special and characteristic relations between the connyon and the yolk.

The develnment of the cmbryo of vertelmated animals is best observed in the eges of tishes, as from their transparency they do mot require to be cot "pen; and with che care the whole scries of embromic changes may be olserved upon the same induvidual, and the succession of appearances of the different organs may be ascertaincul. I'ropsor Agassiz has carefully examined and depictod the principal phases of develonment in the white-fish, which helones to the salnum family, and we shall endeavour to give his chief results. The fullowing magnitied sections. conied from his plates, will shew the period at which the diturent organs successively appear. The egg when latd (tios. (ll) is spherical, atout the size of a small pea, and nearly transparent. It contains no albumen, and the shell mombane and the menbrane of the yolk seem fused into me. In a few hours after it has inew laiel, provided it has come in contact with the fecmudating tluid of the male, a scparation between these two membranes takes place in conserpmee of the absomphof of water (fios 12), ly which the size of the egg is increascol. Between the shell-membrave, $s m$, and the jobls, $y$, there is now a considerable transparent space, corresponding in position ton the allommen of hirds uris. oil globules are scattered through the yolk, lout soon armage themselves in a stratimn on disc towarls the ungre part, where a swelling, in the shape of a trausparent vesicle (fig. 13, !), begins to shew itself. It is cmumsed of very clelicate and minute cells, and is the grm in its earliest starce. As the germ increases, ant has a larger surface in contact will the yolk, we notice a depression on its uiper lart (ige 14), and som after a second furmw appears at ribit angles to the former, so that the gem now presents fone elevations, as we have attempted tos shew in fig. 15. A continums sublivision of thas mature ares on durms the secomb and thired days, unth the germ is divitel into namerns

minate spheres, which form what is tommed the mat
 mot fons rantume; at tha. .rni of that third das, than
 as an 'mselon" aromat the youls, which it at hast - niturly Mirloan

W" fla tonth disy, the first mothene of the ember

ren hession between two little ridges, whose moters approach till they form a canal (see the s) At alont the same time, an enlarsement at one end of the furrow is ouserwed, which is the rulimentary lueal (tiz. 17), in which may soon be distimguishet traces of the division of the brain corresmonding to the organs of sight, hearing, ame smell.

Towards the thinteenth day, we see a transiarent cartiliminous corl (the chorder doradia) in the pusttion afterwards ocenpied by the buk-bone, esmjosed of large cells, in which transverse divisions are forming (tig. 15, o). In some tishes, as the sturgeon, this cartilaginous or embryouic state is persistent through life, and no true osseous vertebral column is ever formen. The rudiments of the eye soons appear in the form of a foll in the external nembinane of the gern, in which the crystalline lens (fig. 18, $r$ ) is afterwards formed. At the same tinge we sere at the posterim part of the head an elliptical resicle, 1 , which is the rudimentary ear. At this perimi, the distinction hetween the upper (serons) and boner (momons) layers of the germ is loest traced: :lll the changes which have been mentioned vecmeng in the mpler layer.

At or som after the sevententh day, the lumer (or mucons) layer separates into two lamina, the interin of which becomes the intestine. The heart at alnont the sane time apears in the form of a simple carty (fig. 15, $h$ ) in the midst of a mass of cells belonging to the midue on vasenlar layer. As som an the cavity of the heart is closed in (tim. $19, \%$ ). regular motions of contraction and expansion are olserved, wnl the movement of bood-corpuscles within it is seen.
It is mot till the thirtioth day that any traces of a cireulation of the low are manifested": we thea notice two currents, one ruming towarls the hear. and the ather towards the trunk (tig. 19), with correspmuling retuming currents. The traces of the liver are now sean. The embryo begins to liberate itself at both extrenities from the yolk, the tail tirst becoming free, and moving in violent jerks.
The embryo, althongh still enclosed in the ursnambanes, now mute's all the essential conditims for the exercise of the fnnetions of animal life: it hats a Imain, an intestine a pulsating heart, amb circulating blood, and a limited amount of spontaneous motion; hat the forms of the organs are still incomplete, nur have the $y$ acruired the precise shan characterising the clasis to which it belongs. The conbryo is as yet only a vertebrate aminal in Wenmeal, amm mint lie takion fur that of a frog as Wril as fur that if a fish.

 and his Comperction Physiolung. from which this artich is mainly diawn, and to Carponter's Come perative Physiology.
 provess which immorliat ly follows "xpusure, :amp which remders the pieture visible in all its metails. It consists in the precipitation or depusition of "1" " material on that fortion of the sensitive surfice which has been acted on be hight; the same prinriple therefore prevails in all prosesses. This may be made clearer hy reference to a few examples. In the Daruerreotyle process (I. v.), an ionlised silver plate, after exposure in the cancria, is exposel to the vapour of mercury: the vapour adheres to those portions of the pate which have modergone a pechliar molecular change from the ation if lient. fut not to those parts unacter an. The lights of the picture are therefore 'developet,' or 'hrought ont," by the acyuisition of nem materiel, i. s., mercurs. A collontion negative is similarly "homent out' by the precipitation, by means of a de-oxidising agent, such as prograllic acid. or proto-sulphate of arm, om the actimistel jortion of the plate, of wem materiut, composed of metallic siluer and organic mattor. A similar change takes phace in the Chrysotyle l'rocess (9. v.), where the metallic salt with which the paper is impregnated is reduced to a state of proto-salt. which reacts through the decomposition of water, and causes the precipitation of nell mutcriel, in the form of finely divided motallic gohe on the parts where light has acted. Other processes minht be cited, but these are deemed sutficiont to illustrate the primeiple stated above.

## DEVELOPMENT THEORY, See Srarte.

DE'VENTER, a thriving town of Mohami, in the furinee of Overyssel, situater on the lissel, abont as miles east-south-east of Amstemlam. 'Townrflankeit walls surround 5 ), which is further defenden by a broad, deep ditch. The strects are usaally narrow, lint the market-phaces are spacions. The principal buildings are the cathealral-a structure in the early Gothic style-the town-house, the court. house, ani prison. From the ramparts, which are used as a promenade, there is a commanimin pospect. The industry of J. comsists in ironfobuling, in the mamfacture of earpets, stockings, \& c. Its gingerbread (called Deventer Konk) is culebrated throughout follam, and many thousam? pounds are exportal anmally. lts butter-market is also very important. I'op. 15, fou.

DEVI'CE-from the midile-age Lat. Ifrista, a drawing or design-is a moto expressed ley means
 in the emblem, a written inscription conning tu be added to the pictarial design, with the view of rendering the meaning more explicit. Wevices thus consist of two parts-a pictorial figure callelt the 'Lody,' and a motto in worts callad the • sonl' of the berice. As early as the times of Eschylus. the 'seven herwes hofore Thetes' all appear with deviess on their shielts; and the same is related by Xemophon of the Lacelamonians and sie ymians. lis the middle aighs, deviees on coat-armour came

uctual demonism. Traces of this are elearly visilde in the Ientateuch. The Hebrew worl seiviz, ocenring in Leviticus xmi. 7, which our translators have rumered 'devils,' means only 'hairy ones.' Now, the Egyptians worshipled the he-foot, and the Hebrews martook, as we know, of their idolater therefore Moses in this verse, formbling them to commit this sin in future, says: 'They shall no more offer their sacrifices to stimin:' i. e., to the Egyptian he-goats. The development of demonism was matedially furthered durime and alter the Babylonish captivity by Medo-I Prsian inflnences. In those canonical books of the Ohl Testanent which belong. in their ${ }^{\text {mesent }}$ form, to the post-exilian perioni. e., the perionl subsequent to the exile-the . Thwish ronceptions of angels lecome more definite. They possess different maks, names, and suecitic ofices. They are the tutclary guartians and helpers of particular lands and peoples, but are everywhere in alsolute delendence on fiok. And now we meet alsn, for the first time, with an angel called Satan, who, lowever, still figures as a minister of God, and along with the others appears in hearen before the throne of Jehowah, but with the function assigned to him uf accuser and selucer. It is he who1 Ghron. xxi. 1 (Chronioles, it shomld be mentioned, is considered by most critics, both orthodox and heterodox. to be the composition of Ezra, and therefore pust-cxilion)-stirs op Daris to number the people: while in the older IIcinew version (2) Sim. xxiv. 1) the same act is ittributed to an :mpry Gol, the conception of Satan not then having clearly, if at all, presented itself to the Hebrew mind. It is Satan also who throws suspicion ar the piety of Joh, and with the permission of Trehovah, cainses a series of misfortumes to befall him: while in Zechariah iii. 1, he is represented as 'resisting' the angel of 'iond, and as a false accuser of the high-priest Joslma. As yet, however, an evil mature is not espessly ascribed to lim, hat, what is much the same, it is assumed that he takes a flensure in active evil. It is a purely arbitrary :and minextual interpretation of lasais xis. I? (How ant thou fallen from heaven, O Lacifer, son of the morning!') that would foree these words to refer to the fall of the Jr, or antermine from them his name. In the Apocrypha, of which only a small part is l'alestimian, the rest being either Chuldaico-Persian (as, for example, Tubios and Buruch) or Agppo-Alexamiriun (as, for example, Wisdrm) in its origin, the alder Ho hrew doctrine of misfortune coming from the angel of , Jehowa is, So to speak, dismembered, ame demwns or evil spirits, in the New-Testament sonse of the torm ( moumule ponira), are for the first time mentioncel (and in Tobitas and Bormh frequently) as the anthors of calamities. According to the ropresentations of these writings, the evil spirits dwoll, like the shder Hebrew hobgoblins, in waste places, but associate themselves for the injury or destruction of men, "uter inta them as tormentors, and can be expelled only ly macrical or mysterions means. To this class of hoince the heathen leities were roekmed to folnog. lint even here there is no mention of an onpmisation or kinuthm or prince of demons. The Sirst trape of a biabolos or l). propur (and nue in all Wroblility springing from a foreinn somper) shews atsolf in the book of Wiadom (ii. E4, in relation to $1 h_{1}$ sembertion of Eve, where it is said that throush the 1). the necessity of death las como into the warll.
In the furion clansine lutwen the close of the Smeyphat and the apparame of Jesins, the dewish Hisa if thenls, ats well as of fimons and the 1 ., pardial an axtensive dewloment. This angeleloyy and dommoney, wholly formign the older lleberw
religiou, was derived in all its essential characteristies from the system of Zoroaster, with which the Jews had become familiar by their long and close interenurse with the Persian enpire during the exile, and subsequently. It was, however, impossible to transfer the malism of Zoroaster into a creed so purely monotheistic as that of the Jews; this would have destroyed the foundation on which their entire history rested. Two beings, equally termal, equally powerful, was an idea which no If brew-mindfud of the glorions delirerance of his furefathers ort of the land of Egypt, of the law given amidst the thmolers of Sinai, of the mama in the wilderness, of the triumphs in Canann, and the cgolden palms of David-could for one moment cutcrtain. Jont. on the other hand, now that as a nation the Jews were become weak and of little acount, hemmed in, and crushed by mighty and advanciag empires, no conception could seem more true, or prove more consolatory, than that which permitted them to attribute their misfortunes to the agency of a demoniacal race, headed liy a potentate only inferior to Tehovah himself. They could now believe that God had not forsaken his 'chosen people.' 'Thus, the dualism of Zoroaster surgestal the kinglom and royalty of Satan, but the doctrine shaper itself in harmony with the national monotheism. The $\mathbf{D}$. am his demons were representel as having heen originally angels, who had fallen from theii 'high estate, been punished ly God, and hat therefore assumed a position of lustility, without, however, being able to materially frustrate the divine purposes. These opinions fomil an almost universal reception among the people, as well as amoug those Jewish theologians who, along with the Mosaic Law, held oral tralition tn he an anthentic source of religious donetrine. Indeed, the only Jewish sect which rejectel them, was that of the Snduncees, who considered them, as also the doctrines of the liesurrection from the Iead, of the Messiah, of the Messianic kinglom, of the Last Judument, of rewards and punishments, and of angels and demons, to be new, outlandish anti-Mosaic myths and theorics. This conflict of olinion among the Jews prevented their ileas of the b. ant demons from olstaining, in spite of their hrond diffusion, a dommatic and systematic stability. The populace and the Pharises believed fervidy in the existence of such "vil spirits; hat their conempions had not only all the heat, hut all the confusedness of snumerstition.

In this conlition were the Jews when the New Testament lifts 11 , the veil of ohlivion that had partially dropled on the face of the nation mome than two centuring before, and the light of history araiu falls brightly on its features. We now find a swann of demons in Palestine. These maclean spinits, however, can be exoreised. When expelted from the smm of the demoniae, their proper home is
 inir to the popular conceptions, therefore, we must suppose thair dwolling to he a dark sulaterrancan regim, althowh, like the demons of the Oll Testamont, they inhal,it also the warth ame the air. They wire ment, as the rirecks anl Josephas thought, the evil spirits of dom men, hat had angelie natures (sere Matt. xxv. 41), and formed a sacicty governed hy a chaif, ealled Satan, Wevil, leedzelbab, Belial, \& . We is nuw firmly ssated in the popular imamination ats a fallen anciol; but as yet there is no hint of his having seduced his followers from their alleqiance to Jehorah, of of thar having fillen at the same time. 'Ihis idmarst appars in the book of hevelation, chap, xii, wher mention is made of a great War in heitwo lutwom Micharl amd his angeds on the whe ham, amb the D . and his angels on the
wher. 'Sum the great diramon was cast ontr,' says the writer, 'that whel serpent, callewl the Devil, and Satan, which deceiveth the whole worlt: la: was cast ont into the carth, and his angels were cont ont with him.' Whether or hot these pmplan ranceptions of the D . ame his inflemen wer materadly ${ }^{\circ}$ spiritually interpetal by christ himseli, it is imporso sible to saly. He may either have acemmmatited his langrage to suit the popalar mole of reatising the l'ower" of lixil (a supposition which involues nothing mow orthy of his simless eharacter), or (for this is the only other hypothesis compatible with ar Wedief in his divinity) he may have intumbed to recognise the "gsential truth of that doctrine of an avil insonality which the Jews derived from, or, at all wents, develonal under the inspiration of Zomonstrian ideas.
but whether Christ meant to accommomate lis lannave to the popular conceptimas or mot, the mimitive church assmod the inersmelity of the 1. ats in unquestionable fict. The New "Tontiment ideas on this peint were not only gratly enhared. lat in many respects entirely chimged, partly through the introduction of a consiturable mumber of heathen motions, and partly through the dowatic tondencies of the time, in conseruence of whish the varions statements in the Bible resarding Satan and evil were uncritically and unhistoric. "ll!! hoperl together, and a doctrine of Satanic wrency elaborated loyically but not theolonically. Hobling firmly to the belief of a Sotanic laingdom of darkuess opposed to Christ's kinerdom of light, the majority of the early Christians asemibed ail cril, physical as well as moral, to the D). ant his demons; failures of the crop, sterility, pestilence, murain among eattle, mental maladies, l"r'secutions of the Christians, individual viees, heresies, astrolory, philosophy, and especially the whole borly of hathenism, with its mythology and rolious worship. The heathen gools were believed tu be conquered by the work of Christ, but not to le whally powerless; thuy sank down into demons, and so a part of their mytholory passed into the dectrine of the Deril. It was they who, as demons, meaning to deceive, uttered oracles, were present at sacrifices, anl inhaled the sacrificial incense, whrehy the notion gained ground that the denom-nature was ever growing more and more sensual and materialised -a nution that reacted again on the conception of hell. which soon began to be paintel in coarse carthly columes, blazing with etermal fire, through which blackened devils and scorched souls flitted in cndless torment. From the gross materialism that now vitiated all conceptions of the D. and of demons, Syang the loathsome belief, common enowg in the early church fathers, but during the mildle ares exhibiting itself only in the surerstitions of the vulga--viz., of the carnal intereourse of devils with women. See Wtrciferift.

Concerning the fall of the 'devil and his angels,' ulinions were loug diverse. Some supposed that it necurred through euvy; athers, through prite; anll others, again, through concupiscence and exeess; sume placed it before, and others after the seduction of Eve ly the serpent. Several of the Fathers (for example, Augustine) believel that man was created to. bill up the gal which had been cansed in the linglom of Christ through the apostasy of Satan and those whom he hul led astray. Meanwhile, the iter of the importance of the death of Jesus haul been dogmatically elaborated. At tirst, Christians saw in that death a sacrifice, and in his blood a propitiatory porer ; lut soon after, their thoughts reverted to the other scriptural representation of an actual victory over the D., a restoration of the Vivine image in man, and the source and condition

 Christians; in all other men ha ifelt and rifol thenerh the foree of urimal sin. la emsanuence of this, he was fommally "hanished' (antal the ofl (.), not only from 'demoniacs,' bat abon from all erne verts from Jublism and heathenism to Clristianity: and When the practico of hartism han shaned itsilt into the dogma, that it was "a suecessary meliminary
 becmie a Christian 'art,' exerciset mall mew-han chiliten. Thase who diel unbaptizal, were (hy that mathess logic that frequently marks a larimaroms thealury) sent to hell; for althongh pothtially Christ's, the chareh hal nat yet resenm them from their satanic master, ly the apmontel rite, ame so the eonditions lreing unfulfilled, the 11 . carried all his prey. Tet the heart of humamity, stronerer in its simple instincts than the nost iron creal exar hammered out of the humsu hrain, shewed its low presence even in so fearful a dumar, aml althonfi it could not deliver the last infonts from the reging of etermal fire, it assigned them less panful paras, aml a less dradful dwelling place. lint while the puwer of the I. over all not gnardel hy Claristian fath ant rites, was sumene; over thase who were so guardol, it was ittorly weal. To Christian not exon the weakest, could lre finterl loy him to du evil. Thas far hatel the "doctme of the devil' been develned at the Sth $e_{0}$, aml at this bint it has essentially remained in the Eastern or Greels Chureh; Int in the Western, it took get another develmment. This was mamly oceasioned ly the writings of Pope Gregny thi Great, who jartly tok up the pomalar notions himself, infused into them wher then jrevalent theological opinions, and clevater the result of the incongrous mixture to the dianity of charch doctrine. He calls the J). 'a stuph beast,' bee cause he hopes fom haven, withont lemg able to reach it, and entauges himself in his own net: but on the other hand, he almits him to have a potatice sublimilutios, and utters the jrofomil inder that he cannot comprohem our thonghts. In these thrus notions lie the essential fermis of the Ciemanic foust-devil. The of Creman and Nonse mythologies parard a thool of heathen fancios into the 'loctrine of the Devil.' Even Clifins, at a much earlier perind, han translated the Dew Testa. ment word daimon or duimonim, lij zuhuth i, i. c., she-devil, or surcuress, because the old fiermans believed in female demons, while the Christian usus lorqumbli contains no trace of such. The pecularly German conception of a now malignant, now pentle ipmole devil. lives to this day in the German phase "The devil is beating his mother" (when ram and smashine duickly altronatel. In England and Scotland, too, the ihrase is, or recently was curcut,

The devil amb his ham.' 'The (icmmans have also the proverlo, "Where the iesil camot come, there he semis his grandmother.' Sinm, howeter, the word doulorlus, in violation of the Niw Testalment distinction between it and drimem, cane to shaify devils of every or any sort. The tinthic fom "f the word was dictombe, diabuthes: old saxon, wiublul, diubleol, diokol: old Hidh (ierman, dinful. tiechl, thabil, \&c. The dwelling of the 1). was, if course, hell, which, however, according to dh Gommic amd Scandinurion notions, was placed in the dreary regions of the north. Although his mischievons powers are to le aretty well controllen till the coming of Antichrist, when he expeets tor hoh carmival, yet, like the ancient gods and demons, he weasionally apmears on the carth. He then assumes at times a purely homan form, but, like Valean, who was thrown down from haven hike hinself, aml the smith Wieland, of German mythology, he is somewhat lame. ITe is covered with a griat, green, or red choak, like the kobolds (1]. v.) and Dwarfs (I. . . ) (the earth and house spirits of the suppressed heathenism) : sometimes, also, he aprears black and sooty, as befits his dwelling-place, amd his orposition to a pare Crind. But as the whl deities, both classieal and German, fossessed the lower of transformation to a most remakable degree, the 1., though his relationship with these, mherited this fower when they vanished from the scene. The form be most frequently assmed was that of an animal, approximatines, in this respect, to, the Gioman forest-spirits am the fireck satyrs aml finms. At one time, he shews the font of a hurse or goat, with horus and tail; at another, he appeats as a black horse, a he-goat, a hog, a wolf, a loll-homad, a rawen, a serpent, a worn, a dragin, or a tly. The comeption of the phwer (if the F . was vastly enlargel by the intlux of these new fancies. In fact, it rose almost to a new dualism; but, on the other hand, also, many mild and frienlly truits of the heathen gents passed ower into the pelmala comcention of the $[$, im $]$ gave to Lis uature a quite new, hommons, and wen merry sile. As, after the introlnction of 'llustianits', otrerings were still nccasionally male to the whe gents, the D. shated in these lomones. A homse, a lec-gnat, on a hound was at times sacriticol to him: anil to the present day the expression has surviven. "Tor hindle a tire fur the devil'-olwinusly :an allinsion (t) altar-flumes. Varimes features of the ohl Norme mols, especially of Lohi and bunar (Thom), the genls if tire and thander, were alw transferel to hin. Hencos the still current phrases in ticmony, when thmader is heard: "The devil mast lue stribine" ami "The rumaway goose is fom to the havil.' (Ihommer.' thmadry, is the word used fordevil in this rase.) Evary mowe tow, which, nemorling tw the Wher heathen betief, was longent in the lesser domons, gimes, \&e, had now it. proper centre in the: errent Fimul himself, who combleffom all the panks attributed to the more grotesgun crations of the Norse mythongy, and work all the wil of the ware malimint spirits; hat, in forman, than lumes were bither frossed inter his servion than absumed hy him, or incamated in his persum.

faith in the lo's occasional incaruation ; then medical stimete destroyel his clams to the wigmation of montal phenomena, which he was once suppersed to hatve directly cansed ; uatural science deprived him of lis control wer the clenents; historical criticism phackel from him his burrowel feathors: while metaphysics and a deener religious exegesis have conlines!, not. Porhaps, to tunihilate his presonality or deny his influence, bat certainly on realise the former under a more spiritual form, and to limit the later by a reverential belief in the wishom and gooducss of (im). See Mayer's Mintoria Diatoli (Ovols. 'Tiill, 1'80), 1Oorst's Domanommine ( 2 whs. Franti. 181\%) and Zowherbibliothte ( 6 vols. Mainz. 1821-1896), and Grimm's Detto he

At the ontset of this article, it was stated that the 'doctrine of the devil had received no eritial treatment from English scholars. The following appears to be the peralent mate of regarding the suliject in this comentry. The Inctrine of tho existence of a personal $I$., the chief of evil spints. and directly or imbirectly the anthor of at least all morel evil, is maintaineil by reference to the Eilhe. regarded as containing one revelation of truth harmonious in all its jarts, amd grahanly developed. The seriptmes of the Old and New Testaments boinn thus regarler, and the suplosition of conflict between the inctrimes of their diflement looks, or of error in any of them being rejected as inconsistent with a fall reconition of their mapiration amd divine anthurity, the doctrim in gncetion is umavonally deduced from them. It is assumed to aypear in the narrative of the fall in tionesis. anl the name sergent is agaun aphon to the I . in the book of Revelation, where he is described as 'that old serpent . . . which deceiveth the whole world ' (hev, xii. 9) : he is believed to be repentedly mentioned in the 0hl Testament. The hypothusis of an extra-mational oripiuation and development of the idea of the 11 . womla, of course, be repuliaten? ant urthondox dirines wolld consiler it more prolo alde that the Persians burowed from the Jow; than that the Jews horrowed from the levidans. The mention of the J. in the Naw Tustament is hold to be condusise, not only of his existence, lat of the helnf in that exintence feren when not expressed or hinted at) mony the obler Jews. The warnines ant exhortations aldressen to ('hristians are, it is also sail, framel on the supposition of danerys arisine from his volence. power, :mal sulthety. It is finther argen, that the prineipal Wijections urgel against the don trine of the existenew of a 11 . are sulstantially the same which present themstles tue the mini as hlltionltios when we sqembate on that which, hawerer, is so matemiabla the uxistence of maral cevil.

 If the" inght also be walu, the susill purtion of inr

deposited on the surface in the form of dew. If this chilled temperature le below $32^{\circ} \mathbb{L}^{\circ}$, the dew becomes frozen, and is called hour-trost. The above two pheromena, though both expressed in our language hy the word dew, which perlaps helps to giverise to a confusion of ideas on the sabject, are not uccessarily expressed ly the same word. Fur instance, in French, the first phenomenon-the fall. ing avening-dew-is expressell ly the word spotin: while the latter-the dew seen in the mornins gathered in drups by the lewves of plants. or ot lio ${ }^{-}$ conl surfaces-is expressed by the word rosée.
'lhe merit of the discovery of the 'Theory of Gew' has been commonly ascriber? to Dr Wm. Charles Wells, who mblished in 1814 his Eissory on Deon, which obtained qreat popularity. 'The merit should, however, be divileal between hin and several others. M. Le lioi of Montpelier, M. I'ictet of Cruneva, and especially l'messor Alex. Wrilson of Glasgow, largely contributed by experiment and induction to its formation. Its history is very interesting, and the curions reader will be well repaid liy a perusal of an article on the sulyect by Mr Tomlinson of King's College School, Lundon, in the Eitinhargh. New Philosophical Jummul New Series), vol, xiii. No. 1. Jammary IS6I.

IENWHERSY (Lubus cersius), a plant of the same genus with the Bramble (q. v.), and very
nearly allice? to it, brit having weaker and more [rostrate roundish stems, which take ront at the ennl, their priekles mequal and Massin"s inscrisibly into hairs, the? fruit consisting only of a fow $(I-5)$ grains, which, however, are muelt larger than those of the brambleberry. The name is derived from the dew-like, bluish hlomm which covers the fruit. The I. is connmon in some marts of Britain, and in masy marts of Europe and if Asin. The fruit is very swecet and agreeahle, and maker an axcellent wim.

Dewberry. The W. af Nurth Ameria":
(R. morumluns), abundiant
is at cheliousus fruit, mueh superime to the Initish fruit of the sume namo ant more tart. The phat is of very humble growth, scarcely rising above the gramul.

JH: Wemte, Whimem Mabtin Lambreche, mue of the all,st theolorians of monern Cermany, was bom doth dannary 1750 , at Vlla, now Weimar, aml stmicel at the miversity of Jomar In 1807, hiv was appuntme extramdinary frofessan of philosiplly at Il cindherra in 1800, profrssur of thendogy ; and in 1810, was called to Borlin. By his pepularity as a teacher, as also by lis writimes, the $W$. sonon acpuired in great reputation. $l_{11} 1815$, on account of it laterer which he wrote aldressen to the mother of the assissin of kotzobue. ho was "herivel of his chair. Not lomg after, hawerr, he was apminted professor of the hagy in the univervity of Basel, where his probetions and sermbus in athort timu sebural lime miversal
 of linsel mand hime a mombar of the Cobucil of Pidneation, innt granterl him the freendom of the city.

In 1840, he was clected rectur of th." nimiversity, but dical the same year, on the 16 the of onas.

De W. was a man of compernonsim lamming, and acuto philuserfice disermment. His :mbipatiy to the shackles of dernatio theology enve keenness and vigour to his eriticism. Vet low formed 10 school, and fullowed in master, so that it is dhflicult to descrine his josition. Ile "imant le classed either with Paulus, Stranss, ur Baurs A tempurate but vary decided historical rationalism, on at broad basis of momal reverence, womlat perhans hest express his biblical stand-pwint. llis pracipal Works are: Beiträge zur binleitung in dess ith" I'rstemmen (Contrilations to an lntrouluction to

(1)erlin, 1817-1826); Lehotuch der Christlichon Dormatic (Compendimm of ('loristim Dogmatics),兰 vols. (Berlin, 1S13-1810); (hristlichen Sittentwre (Chnistian Ethies) ; 「orlesumgen über die Melighon, ihe IVesen, und ihre brscheimengs formen (Lecturns on licligion, its Essence, and Formal Manifestations), Jionlin, 1527; Das 1Fesen des Christlichen Gloubuns (The Essence of Christian liaith), Diasel, 1516 ; and Licegctisches Munthuch aum Newen Testaments (Exesctical Hamelnook of the New Testanent). Besides these, De W. publishel a critical edition of the entire works of Luther.

DE WITT, JAN, a celdmated statesman of Holland, born at Dont in 1625, wats the son of Jach de Witt, a vehement opponent of William 11., I'rince of Orange. Jan inherited his father's hatred of the othee of staltholder, and the family that filled it. 11 is cducation was earefully attended to, and he sonn exhibitel remarkable ability. He was one of the deponties sent by the States of Holland in 1602 to Zealand, for the purpose of dissuading that posince from adopting an Orange policy. There his clenfuence secured hinu universal contitence, which, however, in such tronblons times conde not lonef be retained. In the same year he was made grand pensionary. The Orange farty (sulportal ly the ["phlace and the clergy), durims the war carried on between Englaml and Jolland, was ever striving to increase the power of the yomig brines (afterwards William 111.), who was then a mere infant; the republican, or oligarchic party, composeal of the nobles and the wealthier hurgesses, at the heand nil which was De W., sought, on the other laml, to strip the llouse of Orance of all power, and to abolish eutirely the office of staltholder. Inaring William's minority, the alvantage was, of conrse, with De W. and the republicans. In 165t, on the conclusion of the war with Englani, a secret article was inserted in the treaty drawn m, between De W. and Cromwell, in virtue of which the House of Orange was to he deprived of all state-ollices. Aiter the restoration of Charles II., De W. Jeaneat more to the side of France. This tendency necessarily received an impetus from the rencwal of hostilities between England and Holland in $166 \mathrm{~m}^{2}$. These lasted for two years: and although De IV. acterl with great vigour, his inffuence was dhuinishent, and his party was compelled to concede a larger. mansure of puwer to the llouse of Orange. Ine W.'s prosprects became still more clouled when the desinns of Lonis XIV. npon the Spanish Netherland hecame manifest. 'The Orange party caricul their joint in the elevation of William to the finnily dignity of stadtholiec: On the invasion of the Netherlanels ly Lamis XIV. in 167:, the Prinec of Orange was appointed commander of the Dutch

 $25^{\circ}$ I $2^{\prime} N$, and $8 z^{\circ}: 3 z^{\prime} \mathrm{E}$. The muntan is within the limits of Nepaul.

DIABE'TLS (Gr. literally a syphm, from diabaine, I go or flow through), a disurder of the seneral system, of which the prinepral symptom is a very much increaserl flow of urine. liabetes is of two distinct kinds: the one, diubetes insipulus. is a mere exaggeration of the waterexcreting function of the kidneys, accompanied by extreme thirst, and hence called polydipsia (Gr. exeess of thirst) ly some anthoritios; the other is a more complex disordur of the assimilation, consequent on the formation first, aml the excretion hy the kilueys aftorwards, of an enormons excess of animal sugar (see findpe-stain), the sugar being fomm in excess, not only in the renal exeretion, but in the Bonl, and in mearly all the secretions which lave been examincl. The pathology of this discase, called dinctuters mellitus (Lat. mel, homey), is very olscure, motwithstamling the muncrons recent plysiological reseavelies which tend to throw light on the developnent of surar in the animal organism, and which must undoubtenly he regarded as learing on the solution of the powhlems commeted with this disease. Unhajpily, the cure of it is still entirely unkmom, exepot in su far as it may be controlled or retarted ly gemet manarement of the diet, drink, and clothing. All diabetics are subject to promressive emaciation, and they often become subject to true tuberenar eonsumption (\%.v.), or other chromic lisease of the laugs; it is chictly in warding off this temination that the medical art can be of service, as well as in relieving the symptoms as they ocener. The first fact observed in cases of diabetes is usually the increased flow of mine, when it beeomes so great as to amount to a practical inconvenience; anl also a considerable increase of the appetite, and an unguenchable thirst, which rarely fail to acomjany the disease from the beginning, but often do not attract attention, or at least surgrest the illea of anything wrong, till an adranced stage of the disorder. When the patient demands medical assistance, he is usually somewhat thin ; the pulse is quict, the skin cool, the heat of the surface, indeed, halitually rather low and casily depressect. There is ofter a complete absence of persuration, which gives a peculiar feeling of haskiness to the surface, especially of the pahns of the hands. With these symptoms, the tirst approaches of puhomary disense may eoncur. In the very last stares, there is sometimes inopsy of the feet; and the nriue may be natural in cumbty, or eren diminished. For the other characters of diahetic wine, see Ufine. The cure consists in remoring from the dict, as far as pussible, consistently with eomfort and due nourishment, "verything which easily turus to the furmation of anmal sugat in the system, especially all

 of whator of wheat withont starch, or han-cakes
 and in most of the weat capitals, als Lamlon and

DAACIDLON (Gir. Iitratty, from jutes-i.c., wactable juiens, a decontive ctrmolngy, as the phaster hats reatly mo sueh combrasion), the emmmon lualing or athesive plaster, male liy combining litharge, or the red axite of learl, with mive-nil, sin as to form a kind of soap. The preparation of this phater is mow cationly taken out of the hamle ot druerists, it luing freparel on the great acale by machinery.

DIADEAI was the name siven the fillet of sill, woullen, or tinen which sersed as the distin. suishins ornament of kings. It was venerally harrow, beine conly a little broder on the forcheat. The dialem of the Esyptian godiesses and lings bore ther symblal of the sacerel serpent. The diakim of bacelnts, as it appears in antipue sculptures, was

524

## DIERESIS-DIAL AND DIALLING.

a plaited band going round the forehead and temples, and tied behind, with the ends hanging down. Among the Persians, the dialem was bound round the tiara or turban, aud was of a blue colonr worked with white. The early Roman emperors refrained from using this ornament, in order not to call mp recullections of the hated kingly office. Diocletian was the first to introduce it again, and Constantine the Great added new omaments to it. After his time, it was adorned with a single or donble row of pearls and precions stones. Queens are also seen on coins ornamented with the diadem, with the addition of a vell. It was finally supersented by the Crown (q.v.).

JIA'IEESLS (Gr. fioino, I divide), a term used in Grammar to signify the resolntion of a diphthong or of a contracted syllable, into two syllables; as Lat. aume into aurat. The name is also given to the mark: placed above a rowel letter, to indicate that it is to be imlependently pronounced, and not in conjunction with a preceding vorm: as in the above example, or in the woth airiut.

DLAGNO'SLS ( Gr. Nim, through, and gmosis, bnowledge), the throughknowledge or thorough knowledge of a disease, ambracing its points of distinction from other distases, its symptoms, their redation to one another, amd to the state of the different organs and functions of the hody, in so far as this can le appreciated during life. Diagnosis is usually spoken of in contrast with Prognosis, wlich implies the julgment framed hy the physician as to the issues of liscast: and also with Trophylaxis (pro, from, and photwis, protection), which refers to the warding otf disease, when sumpsen to be impending. Bagnosis includes the stmly of all the vital phenomena of diseases, and alsu of their apmearaces after death, in so far as this can aiel then discovery during the life of the patient. It is usual to spak of rational ur ilysintogical diagmas or diamonis loy symptome-i.e., functional danges: and of physeal diamosis, we thamosis ly signsi. e., objective phenoman apmeciable by the senses of the observer. The latter method of diamosis has been muth enlarget in seupe, ant inmeased in importance of late gears by the modem discovering in Ansentation (q. r.) and Perenssion ( (1. y.), and also by the :rreat alyancus male in physiological chemistry, and ly the u"e of the microscoun.
 line fining any two angles, not adjacont, of a rectilineal ficure. A line drawn between two aljacent angles woud coincide with the homblay-line. A tramgle las no diagomal, because any two of its angles are aljacent; a four-siled figure has two diacomals; a five-sided, five ; a six-sided, ninn; de. The nmmine of pussible diagemals in any fighere is fomel hy taking three from the number of sides, maltiplyine the remainler by the mumber of sides, amb takine half the promuet. Thus, in the six-simed fighere, the process is "or
9. If the diagonals mast 10 so drawn as mit to intorsect, their momber is :avay's three less than the number of sillis. It makes no liffernce whether they all procem from
 by planes, is a line jainime any two solind andes se situated that the lin. alows nit coincide with any
 rliapomals in a piren setid: Alaltiply the number if sodich aneles ly the same mmber diminished ley une, :hm from half this prodnct subtract the nimmer of edges on the figure, and also the sum
of the number of diagonals in all the faces. Thus, the culue gives $\frac{8 \times 7}{2}-12-6 \times 2=4$ diagonals.

DIAGONAL SCALE, a system of lines by means of which hundredtlis of units may be laid down or measured with compasses. It is thes constructed : Lay off. on a straight line, any equal parts EA, AP, BC, CD, \&e. Draw ten lines parallel to DE , and equidistant; and draw EP, $\mathrm{AQ}, \mathrm{Bl}, \mathrm{CQ} \ldots$ \&c., perpendicular to DE . Divide $\mathrm{QP}, \mathbf{A E}$, into 10 equal prits. Join the 1st, 2 I, :d....divisions on QP with the 2l, 3d, thl....livisions on AE respectively. If the divisions on AD each represent 100 , each of those on QL' will represent 10 . Thus, from 3 on AD to 8 ma Q1 is 350 : but ly moving the points of the compasses down to the fourth line, and extending

Diagonal Scale.
them from 28 to $o$, the number will be 384 . For the distance of $S$ on $U P$ from $Q$ is $S 0$, and of $r$ from $A$ is 90 ; and hence that of $o$ from the line $A Q$ is $S t$. When the divisions on AD denote tens, those on QP denote units, and from $n$ to o would then repre$\operatorname{sent} 35 \frac{4}{10}$ or 384 . When the numbers representing the loacths of the sidus of any figure would give lines of an inconvenient size taken from the seale, the numbers may be all multiplied or all divided by such a number as will adaut the lengths of the lines to the required dimensions of the figure.

DLAGURAS, a Greck poet and philosopher, was horm in Mclos, an island of the Cyclades. He Hourishat in the 5th c. R.c., but beyond his reputation for atheism, nothing rery positive is known regarthing his eareer. Ie is said to hare been a disciple of Democritus of Aludna, and to have residel during the more impurtant part of his life in Athens. Wo is alluded to ly Aristophanes in the rlouds ( 424 r.c.) : and from an epithet applicd there to nocrates, it is highly probaille that that yreat philosofher hal been a phyil of D., or at least held similar opinions. 'This will perhaps explain to us the aceusation homght against him of atheism. In all likelihom, D . was no atheist, but simply a distulierer in polytheism; and the anecdotes rolaterd of him, such as his ones throwing, when ill-ofl for facl, a worden image of Herendes into the fire, to cook his dimer, serve to eontirm such a supposition. lle secms to have beon witty and fearless, and probably treated the rule superstitions of the common-place Athemians with dashing contempt. In this way he may has become specially notorions, and sustixal himsclf in the Greck mind as the remerntulice atheist. 1) yas hanished trom A thens professedly on account of his impiety, but really on acconat of his polities. The went first to l'allene, and afterwards to ('orinth, where he died. Ile wote lyries of various kimhs, aml a philosophical work entiticul Phrugisi Lorovi. D'rsonally, he was a man of untanted 'larater, and diselarged his duties as a citizen in an carnest and exemphary mamer.

1H'AI, ANODIALLINC. A sm-dial is an mstrument fur masuring time by means of the motion of the sun's shalow cast hy a stile erecter on its surface. It is an instrmment of very great antiquity, the carlicst montion of it being in Isaiah xxxviii. 8;
and before clucks and watches loceane common, it was in general use as a time-kecper. The art of constructing dials to suit imy place aul sitnation, was then an important branch of mathenntical stuly; now the sulject is mure an ohjoct of curinsity than utility.

A did consists of two parts the stile or guman, usually the culge of a fate of metal, always maxte parallel to the carth's axis, ann! poninting towards the north pole; anl the diet-plene, which may ha of any hard sulstince, and on which are maked the directions of the shatur for the several hums of the day, their halves, fuarters, \&c. Dials receive varimus names, aceoriling, mustly, to the positions which they are constructed to ocenpy.

Old Sun-dial:
In the Zoological Gardens, Edinburgh.
When the dial-plane is on the plane of the lorizon, the dial is ealled a horizontal dial ; when perpendicular to that jhane, a vertical dial. An equinoctial dial is one whose plane is paralle! to the equinoctial plane. Besides these minnes, there are others, such as the seuth dial, north dial, east dian, west dial, polar dial, declining dial, of which it is uscless to write at length. These names all derend on the position of the dial-phane. The cylindrical dial is a dial drawn on the cursen surface of a cylinder. The ring dial is an iagenions small portable dial, but rather a curions toy than a philosophical instrument.

A night or nocturnal dial is an instrument for shewing the hour of the night ly the slauluw of the moon or stars. Moon-lials may be eonstructed relative to the moon's motion; or the hour may be found by the noon's shadow on a sun-lial ly the following, rule: Observe the hour pointed out by the moon's shadow; find the days uf the moon's age in the caleudar, and take three-fourths of that number for the hours to le added to the time slewu by the shadow to give the hour of the night.
Dialling.-The stile of a dial being parallel to the earth's axis, those familiar with spherical trigononetry will readily see that the problem of construeting: adial resolves itself into that of ascertaining where the hour-lines ent a given circle, with a view to the graduation of the dialplane, We do not here presume the reader to be acpuainted with spherical trigonometry, an laccordingly ${ }^{\text {roceced }}$ to illustrate the prineples of dialling in a popular manner, taking our illustrations from Ferguson's Lectures (4th ed., 1772, Leeture 10), which should be referred to for fuller information. Sulpose I'ep
(fig, 1), a hoflow iurl transparint splacre, as of glass, to repressut the varth; anm suppuse its cquater divided inte 21 mpaal parts ly the nueridians a, b, c, d, ice, me of than pasting through a given
 the hour of twolve be marked at the equator, booth on the latter merikian ank that "posite it, and

Fig. 1.
all the rest of the hours in order on the ather merilians, those merilians will loe the bour-cireles of Lomton, lucause as the sun oppars to move rount the earth in 24 house, he will 1 bass from one merilian to another in one bora. Then, if the splicre has an oprapue axis, as Pep, terminating in the poles $P$ and $p$, the shadow of this axis wonld fall, in the course of the day, on every partionlar meridian and hour, as the sun came to the pane of the opposite meridian, and would thus shew the time at London, and at all other places on the same meridian as London. If the sibere were cut throuch the millle by a plane ABCD, in the rational horizon of Lomlon, and if straight lines were duaw from the contre, $c$, of the plane to the points where its circumference is ent liy the lourcircles of the sphere, those lines wouk lie the hourlines of a horizontal dial for London; for the shatuw of the axis would fall upon each particular hous. line of the din], when it fell uma the like hourcircle of the sphere Similarly, if we supnose the sphere eut ly any other flane farion the memilian, the hour-circles of the sphere will cat the ense of the plane in those points to which the hour-lines must he drawn straight from the centre; and the axis of the sphere will cast a shatow on these lines at the respective lours. The like will holl of any plane, whether it face the meridian or not, povilecl it do not coincile with it, or do nut conimeile with a plane through the phes, and perpudicular to the plane of the equator: In the latter case, the axis would have no deration above the plane of the dial; in the former, the shadow woml not move civenlarly:

The universal dimpling oypinder, su invention of Fergusm's, is represented in dif. ABCL is a glass eylindrical tube, closed at luth cols with hass plates, on the centres of which a wire or axis, EFG. is fixel. The tube is either fixed to a horizontal loord, II, at an angle equal to the latitude of the phace, or moves on a joint, so that it may be elevated till its axis is parallel to the carth's at any latitude. The 24 honr-hues are drawn on the outside of the glass, equidistant frem one anothor, and parallel to tho axis. The XII next B stands for midnight;
the XII next the buarl, for noms. When the axis is aljusted for the latitude, and the hoard levellen, with the line IIN , me the meridian, and the eme towarls the north, the axis EFta, when the sun shimes, will serve as stile, anel cast a shadow on the hane of the day among the paralled hour-lines. As the plate $A D$ is parallel to the equator, and EFG

Fig. ㅇ.
perpenticular to it, sight lines dram from the centre to the extremities of the prablels will be the hure-lines of an equmoctial dial, and the axis will be the stile. A horizomtal plate, of, if put into the tule, with lines drawn from the centre to the several parallels enttios its edece, will be a lowizontal dial for the criven latitude: and similarly a yertical plate fronting the merilian, and twaching the tube with its alge, with lines drawn Irom its centre to the parallels, will lee a vertical someth dial, the acis of the instrument in low cases serving for the stile; ann sinilarly for any other plate placed in the cylimer. If, instman of being of "lass, the cylimuler were of wood, :uyy of these dials minght be obtained from it by simply cuttins it in the planes of the $^{\text {blates, }}$ and drawing the lines on the surface of the section.
D) MLECT. In spaking of a pratle hatwin "Ssentially all one laguare, Jut living extended over an extensive territors the bame of Dialects is Siven to those varictios or pendiu forms which that lampare assumes amming the varions triles ur other lenal divisions of the purple. It is clear that the wilder the separation comes to loe hetwern the several triber, ame the mow they differ in monde of lile and other circumstimese, the bore marked will the differences of diabet leceane. Also when it particular tribe of this people increases in numbers, amb also extemes its turritury, the same process is ropathal, ind its dialdet licomes lyoken intor a mamber of sub-lialects. The principal check to this tomdency to somminsly endess sumbivision of lansuate, is furnishat by an inceasing degre of common enture and civilisation. Whare this is wanting as in Africa and anmer the native prophlatimus of Smerica, the sulativision is practically (1011) ss.
 hy the fiut, that the civilisition of sman thimes divelops itself mere richly and ripens carlier than that if others, while sane eval amdergo decline;
35
this must necasion corresponding differences of dialect. Further, whe dialect may hecome dominant over one or more of the others, throngh varions influences, the chief of which is the 1 ower of potry, especially if fawoured by extermal relations. Fimally, if to superior manifestations of oratury and loetry in any dialect, the conservative aid of witing be added, there is created a written language, which jasses enrrent amung wther tribes to the same extent that the literature of which it is the vehicle finds favour. It is not always the dialect most perfect in itself, nor yet that of the most powerful tribe or division of a prople, that comes to be the written languare. Accidental circumstances have, in many cases, decided the rivalry. The Bible happened to lec translated by a lligh German, Luther, into his mative dialect; ather works on the then allengrossime sulject of religion followed in the same dialect; liapily, too, the art of printing had just attained the jurfection necessary to give these proluctions general circulation. It was this concurrence of circumstances that decided that High German should in future be the spiritual bond among the wide-spread (xemman people. For there were other dialects whose claims to the distinction wore at that time equal, if not higher. See also Exglisif Linguage.

When a dialect has thus become the vehicle of written commmication, and of the higher kinds of oral address, its character and position become changed; and it stauds henceforth in a sort of antaconism to the wher dialects, and even to that out of which itself sprung, For writteu language is chiefly employed in the ligher departments of homan thought and activity. The intellectual ank moral elements, therefore, predominate in it over the sensible; and what it gains in dignity, precision, and pliancs, it loses in richness of inflection, in fricutly fanilharity and naturalness. Io contlici with this standard speech. the dialects must go to the wall. They live for a considerable time, it is true, even in the month of the elncated classes, becoming, lowever, gradually more and more confined to the most necessary and familiar forms of interconse, anl hosing their chavacteristics in the strem of the written language. They thas hecome, after a time, the cxclusive possession of the lower orders, in which position they preserve many rehes of ohe grammatical forms long after these lave lisappeased in the language of literature, hat withont the power of alyancing or of being enriched loy the products of leep thinking; and though they may ahound in single expressions of great heanty anil delicaly, the general character comes to lue luw and course. But so long as a linguage lives, the literary standard and the dialects nuwar cease to act and reict on one another.

The chiof peints of difference between the diajects of a langine and the stundard fall under four hamb. The first consists of diflerences in the Clementary smmds on letters, ench dialect having a tembency tu sulnstitute sume une or more vowels of consmants for whers. Thers, the standare Eachish bull. is in Ircland hombl: in Sicotland, bauld; what, where the $h$ is marly evanescent, hecomes, in a Sheotsman's month, or rather throat, chowe ane in Aowhemshire sootch, fit $f$ in this subdatect being reughaly substitutad for wh, or rather teec. 2. Each dial oct has pernlinitios of grammar: In many parts of binchand :und in seothand, the ilural of eye is not ryes, lut cem, of com, like or'm. The halnitnal use of the whe the standard mammar pescriles am, is, are de., is presalent in large districts of Eugland. Of this kind is the nise of the strong ennjugation for the weak, or vico versa; as loup, lip, luppen, for leop,

## DIALECTIC-DOAMAGNETGM.

leapel, heaped. :3. Deculiarities of vocthalary: Thess indivilual words curront in (has or mome districts, but unknown to the standard veratulary, are fow-
 words of ath older stan of the lambige, that haw survived langer in sume lacalitios than in others. Some prowineinlisms, ass burn or heion, fine child,
 common to scotland and the meth of Snglind. Others are more lowal, as to fram, for to fise on on coment; homen, a Virkshire tom for penty mar: thrima, in Cheshire, to cenden. The exclusinn of such words frou tha stimbind lamenare is often accilental, and many of them mieht low ind ins
 f. Decoliarities of intonation: 'This is sometimes, though with little pronicty, alled acemot, which me:ons strictly the stress laid umen a partienla sylable of a word. There are medombthat peemio arities of this kind toms. The tembeney of stamdere finglish, "specially the more remot, is to thera the aceent toward the legimning of the word; in reatland, the tenteney lingers to say any for tomp But peendiarities of iutenation lie in the ditferent ways in which the pitch of the voice is mamarel -in the musical accompmiment of articulation. Differnces in this respect sive rise to the monntonous drawl of oue district, the angry quembitis tome of another, the sine-song of a thind, ixe.

Solong as dialectic sarieties of lamquare wore looked upon indiscriminately as conerightions and barmarities, they were only moticed loy seholars that they might le avoided. A more rational phathorge, withont trenching non the rules of genl writins: considers them as essential parts of the spuch of a pople, and a lonowlede of them as mecessary to any thorough investigation of the genins of that surech.

It is obvious that Dialert is mitirdy a rolation tem, and that what we eall lyy that name in ome connection, we may call a languase in another vomnection. 'Jhus. Freck and Lation may' le ealled sist ${ }^{-r}$ dialects of that jmimitive languase from which it is held that they, as well as the other mombers of tho Indo-European fanily, lmanched ofl. See Alsw languages. Speaking of Greek ly itself, howewr, it is a language, and lonie. Dorie, Attic, \&e, are dialects of it. The same horls eromi with the others. In practice, however noarly related the spech of two perples may be, we dhe pot apply the term dialects, unless the peoples are mutually intellind and have a common literary standard. Intelligihility choes not go for much, fat political relations enter more or less into the nution. Thus, Seatch is sometimes spoken of as a distinct lampare from English; and yet in 110 part of Scotland is the common speech so unintelligible to an Enorlishnan as is that of somerset, which is always a "hialect.' This arises from seotland being thought of as a seprate conntry, which it once was; and its spech as the velicle of a peculiar literature. Sec Americamisas.- Dialect is not $t$, be eonfmanded with artificialities, such as the jargom of thiewtes.

IHALECTIC is a Greek word which siguiticd rriginally 'the art of consersation,' lont cante to have a technical signification in the lagnarge of philosophy: At first, it implicel it regular aud scientific methol of treating general conceptions or general terms-a sort of cuatomy of names, nud thromer them of the thines denoted. In the sucratio philosophy, and more especially in that of Ilato, dia. lectic was thas the method of the lighest and decrest kind of speeulation. Aristotle gave another signitication to the wod. Aecorling to him, a scientitic prone or doluction is diterent from a dialectic prenf, winch is only a probable deduction. After this,
 the art of so usin? the forms of ramouns as to

 with lowic, lario, lawerer, wheh wrimaterl with Aristotle, is pronaly thu scimene of the forms of thinking; it is less dimetly conmond with words than dialectic, whind in this view becmmes an shb Intinate provines of lande-the art of dosputation. Dhalectio, in fient, is little lowal of where philusply is insition and exprimental; it is chodly utsed with remeral to the now ideal and it peime
 Sebellines, \&e.

 as is varicty of it. It chemical cmmpmitom is essumitially the same: It is selmm fumat vary 1"renetly erystallisul, hat manlly masive, grinular in dissmmitend. It hats generally a metalli. ami buarly ur silky hastre. i vory lecutiful brielat areen 1). (omaraerdite), foum in awitgerlant, Italy, Comsiea. India, Latumbr, de., is prized fur arnamental purnoses; in 'arsica it ocemes dissminated in af felspar (Lethentorite or somssurite), whirh when rut and polished, appers spottel with it, and is of arent lranty, is male intu loxes, vases, EE., is mach valuct, ant is known by the names fichlon,
 if a yellowish of lownish colom, is samotianes callud Bronsit.
ID'ALOGEE, a conversatina luetwern twa or more persoms, mplying, lowerer, weater muity of subgect and fomality than an ondinary conversation. The ancient lired flidusumers were fonl of this way of combuctine their investigations and conveying their instrnctions. The soeratic dialogen is it consersation in the fom of (question and answer, so contrivet that the ferson ifuestioned is led himself to originate those inleas that the forstioner wishes to ming lofore him. The dialomes of Jlater are, as it were, philosophieal dramas, in which the Sueratic methon of investigation is lounght $t$ hear upon speculative subjects. The form of the dialogue is but ill adapted to the modum state al science. Of the mure eminent modern writers in this form, wo may mention Erasmms in Latin; Lessing, Herder, am Wheland anoms the Giermans: Petrarch and Machiavelli in Italy; Vemelmand Foutentle in France ; and Lerkeley, Durid, and Harris in England. Landur's Inmpintry C"merostthoms are a hafys etfort of this lime. When dialenge is combined with action, we have the drama.

DIAMA'GNETISM. The fact that irm is attraeted by the mannet. has been kunwo from very remote times; that hismonth exhibits a rephlsive action towand the maguctic needre, has leen now known for nearly 100 years. Dr Finalay was the first ( 1545 ) th shew that all homlies are nore or less affected by magnetic julluence, and his beantiful researches on the suldect have opened ny a new theh in the domazin of science. He fommi that the marnetism of luolies was manifestel in two ways-either in leing attracted ly the manaet, as iren; or in heing replled, hike bismutla. When a needle or slander rol of irn is suspundel hetween the poles of a maguet, as in fise $\mathbf{1}$, being attractend by them, it takes up a position of rest en the luns ch, joming the two poles. When at sulstance buhaves itsulf in this mamer, it is said ly Faralay to be peramumetio, and to place itself insinlly, ith $^{2}$ beine the axis. A rul of lismatls, on the wher hand, being repullel hy the plos of the magnet, cones tu rest in the line ad, at richt augles to ab Dismath, aud the like substances, he calls

## DLAMAGNETISM.

diamanfetic, and they are satinl to place themselves Equatorally, cal being the equator. These terms, being both definite and grallic, have been unirersally adupted. Magnetic is the term used by

Iis. 1.
Faralay to indicate nurgnetism of sither sort, altiongh in reneral lamruage it is umberstoon to refer to parmarnetic bodies, such as iron, \&e. Paramagnetic hoilies, then, are those which manifest the same properties with regard to the magnot that imn dous; and dimagnetic bodies are those which, like lismuth, shew opposite but corresponding froperties; so that in circumstances where puramanctic boclies place themselves axially, rliamacnetic boulies flaee themselves equatorially: and where the former are attracted, the latter are repellod, and rice rerad. A baramametic, there* fore. wot in the elongated form. but in a compact shape, such as a ball or cule, is attracted by cither pole of the magnet. when suspendel near it; a ball or cube of a dimagnetic, on the other hand, experiences, when so placed, repulsion. The paramagnetism of iron, nickel, and cubalt, becomes manifest in the presence of magnets of ordinary power; hut the magnetism of most other sub. stances is so feeble as to be developed only under the influcuce of the strongest magnets. As cleetromagnets far exceed permanent steel maguets in strencth, they are selcetml for investigations on tho manuctism of bodies. Fis. 2 represents an electromagnet which may be empluyed for this purpose.

Fig. . .
The soft iron hotwshow l'll? enveloped towares its atremitices in the conis of inalated copper-wirn en, whim mommenicato with a galwanic hattery ly the wires an of fixed in on undith women frame.
 the bathe of hard whinh forms the urgicr part of the frame. lat arder amseniently to susperal

 frame of simple fonstruetim, fics $: 3$, is made of lit the table. The apper fatu of ilue frame ahmits at womper rinu, into which in moright ghass tuln is
fitter. The threar by which the needle is suspended is wound round a slender movalle boblin at the top, so that it ean le elerated or lowered to the proper position. To modify and direct the action of the magnet, two pieces of soft iron (fig. 1) are made to rest on the ent faces; these are pointed at one extremity, and flat at the other, so that the force of the magnet may be concentrated in the points, when they are turned towards each other; or diffused over the oppo. site flat surface, when their position is reversed.

To observe the effect of the magnet on liquids, Faralay flaced them in long tulves of very thin glass, and suspented them as in the case of solich

Fig. 3. needles. It was foum that some arranged themselves axially, and others equatorially. The attraction and repulsion that liquids experience in the presence of the magnet has been prettily shewn by Ptucker. A large drop of bquid is placed in a watch- class, tiges $\frac{1}{x}, 5$, and laid upon two poles of the

Fig. 5.
shape shewn in the figures. If the liquid be paramagnetic, the surface becomes depressed at the interval between the poles, anil heaped up over the extreme edses of them, fig. 4. A diamagnetic liguid, on the other hand, shews a dejression at each erge of tle pulea, and a heaping up at the centre, tig. is.
The magnetic nature of flames and gases has heen alson studiad. When the flame of a candle is brought betreen the poles of a mannet, it is repelled by then, and thrown out lonizontally into an equatorial position. To ascertain the magnetism of gases, Faralay inflated soap-hubles with them, and their bara- or dia- masnotism was exhbited hy their heins attracted ur repelled by the poles. lic ascertaind the same loy casing the gases to flow out from glass thlus in the presence of the poles, when the peeular magnetism of the gas was shewn ly its choosing an axial or equatorial means of ercriss.
The following list gives the kimd of magnetism displayed by the mote emman mbstances:

Poretmednetio.- Tron, minkel, cobalt, manganese, Flnominm, titanim, pallawlim, purer, seating-was, proxide of lawh, phandran, romblead. sulfitate of aine, sla, ll-lac, bermilion, charenal, proto and per salts of imm, salts of mandurse oxygen, air.

Jientumetio: - bismuth, autimony, zinc, tin, c:atmima, smbima, matensy, lat, silver. copper, ghan, arsenid. Hrmiun, tunesten, rockerystal, mincral achls, almon, alass. litharse, nitre, bhos-

'I'lue naturo of the medium in which the brety under -xaminatimen moves, exorts a jowerful inthence on the athare and amonat of the marnetism it exlinhts: thus, if al "lass tulne le fillud with a solution of the potorsuldiste of iroo, and suspemed between the
poles, it will place itself axially. It will hos the same if made to move in water, on at sulntion more dilate of the protos sulphate of irm. It will le indifferent in a solution of the same stronith; lout it will place itself comatorially in a stronger solution, Thus, the same substance maty aquary paranagnetic, imlior rent, of diamonetic, itomeding to the nature of the modime in which it moses. As a gencral rulu, a bonly shews itself patmang netie towards one less paramannetic thatu itaif, indiflerent towarls one equally magnetic, amd diamagnetio towarls one mone pranagnetic than itself. The same takes place, muthtios mutundis, with diamagnctic substances. This has given rise to the theory, that there is 110 such thing as dian magnetism jor se, and that bulies are diamarnetic only in media of greater paramagnetic power than their own. This view of the case is, howevel, rentered lighly improbalde from the fact, that dimarnetism is exhihited as decidedly in a varome as in any medium, and a vacum canuot be supposed to possess magraetic propertics of any linu.

DIAMANTI'NO, a simificant name in the dianond districts of Jrazil, indicates a river and two towns.-1. The river, apharently an afflucnt of tho l'argquiy, and, through it, of the Plate, rises in the province of Matto Grosso, being joined by the Ouro 70 miles to the north-north-west of Cnyaln. 2. Of the two towns, the more westerly stands at the confluence above mentiuned, having a papulation of 4500 .-3. The more easterly town, again, is in the province of Nimas Geraes, amd stands amid the heal-waters of the St Francised at an clevation of 5700 fect above the sea. It lias about I 4,000 inhabitants.
DlA'METER, in Geometry, is generally usel in speaking of curves, and its most geleeral detinition is, a straight line lisecting all parallel chords in a curve. In the circle, cllipse, and hyperbula, all diameters pass through the centre, and are there bisected. Only the circle has all diameters equal; and each biscets the chorls at right anches to it. In the ellipse, this last is only the case with the two diameters ealled the major and minn axes. In the parabola, all diancters are parallel to the axis. Hany curves of the higher orlers have no diameter at all.

We spreak also of the diameters of solid bonlies of a round shape. In the spluere, lines passing through the centre are diameters, and so in the ellipsoid; they are all bisceted in the centre.
DI'AMOND (emrupted from fir, atement. untamable, refractory'), the most highly valuen of precious stones, and the hardest of all lnown substances. It consists of Carbou ( 1.5 . .), a simple or clementary sulustance. crystallised. and in its greatest purity. Diamonds are commonly colourless and clear like water; although sometimes, from some slicht foreign intermixture, they are white, gras, ycllow, green, brown, and more rarely orange, reil, blue, or black. The lustre is adanantine auk very high; the transparency perfect in specimeus perfectly free from foreign sulstances, the presence of which, however, even in very small quantity, mars it, and sometimes almost produces opacity: The D. becomes positively electric ly friction, but is not electrified lyy heat, a test which sometimes serves to distinguish it from the topaz, Its specific gravity is about 36 . Its primary form is a regular octalicdron, hat it appears also in rhombic dodecahelrons: and its crystals often have curvilinear faces and edges. Its strncture is distinctly lamellar. It buns before the blow-pipe in air or in oxygen gas, combining with oxygen to form earbonic acid. Its hatdness renders it incapable of being scratched by
any other substaces, and in cotting and folishome dianomits, di:numblate is muphycet. The colimat tion in which it is luht as a precions stome is due to its manarkaldo harducs, rarity, and brillatey. The art of enttine diamomes, athomal lomer practised in Latia amd China, was mot kown in Lurap tall after the midule of the lithe co. when it was disenvered by Lamis van beremen of firmeng. I'revions to that time, diammals were set withont leman ant, and in that state they have often a math. dadl, and mover surfoce Diamonls are imbed fomm not only in The firn of gerfect crystals, hat also in rolled grains: and they are obtanem partly from alluvial soins and the sames of rivers, and lartly from ropks, chicely a guartzy simistone or conglomeater, in which they are oftom associated with gold. A mamber of localitios in India have loner been celobrated as prolnctive of diamomes particularly (foleonda ( 1. . . ) ; they are fomed also in Malaccat, Bomeo, and other gaits of the Enst; nor were any dianonls procurel in any ather part of the world till the heriming of the Isth e., when they wore disenverel in remarkable abmance in the district of Serra do Frio, in the province of Minas (ecraes in Brazil. Irrerinus to that tince, dimmonds formd in brazilian gohl minces haul been lissegarlat as mere pelhles; their mature lecame known in consequane of some of them accirentally findins their way to Furope. In 1429, they werc discovered in the Ural Mountains. They have also lsen finum in liatherford comety, North Carolina: in Jale comity, Georgia; in the province of ''onstantine, Algeria; and in Australin. Diamond minse consist in general of mere dighings and
 purated is to rake the alluwal matter backwards and forwards on inclined planes, over which a stream of water is mule to rum, till the lighter partieles are carried away, when large stones are pricked ont liy the hand, and what remains is carefully examined for diamonds. The work is carried on ly slaves, and when a diamond of seventeen carats is cound, the slave who finds it is entitled to his liberty. Large diamonds are comparatively rave anony those of Brazil, all the notable diamonds in the world heing Indiau, Brazil produces yearly irom 25,000 to 30,000 carats of diamonds, of which, however, not more than 9000 carats are capable of being cut, the rest being either very small or of inferior quality. The small and inferior diamonds are called Boer, and command a ready sale for their use in the arts, being pounded in a sted mortar, and mach enphoyed in the forn of hiamond-dust ly lapidaries for cutting and polishing diamouds and all liods of gems, nud w-th for polishing rock-crystals for spectacles. Dinute fraguents or splinters of bort are also usel for making fine drills, which are used for drilling small holes in rubies and other hard stones to be eroployed in watch-making, cold and silver wire-drawing, \&ee, and for piercing Toles fin rivets in chima, in artificial amacl teeth, dc. Tho use of small diamonds liy glaziers for cutting glass is well known. The diamonds so usel are mencut, and they are so mounted as to act umm the flass not by an angle, but hy a curvidinear edpe of the crystal. The ent is unly to the rlepth if about one two-hundrulth part of an inch, hut is sufficient to make the glass readily lomak in accord. ance with it.
I binuonds are cut into varions forms, but priancipally into brillimes and rose diamonds. The brillime cont is the most expensive and difficult, hut is also that whill best brings out the beauty of the stone: it has an upuce or principal octagonal face. surmonded with many facets, and "ther things heing equal, the sreater the number of facets the more raluable is the diamund. The lapidaries of the East,

 for latrge shipe, is sitaated on tha left wivlo of the Hously, about so milos leblow the eapital, with whish it is commeted lyy inn exombont matil amel by electrie wires. As the inlperont comotry is swamply and unhealthy, the spert is marked only by at fow mative hots. 'The commoreral value of tho locality, however, is likcly to incerase, in jropention is than silting up of the diver above imperes tha mbard navigation.

HANOND NECKIACE, THF, a Wonderful piace of jewellery, male in Laris abont the yoar ITm, and intented for Madame Ita liary, the favourite of Lonis XV. She, however, was rxeludes from court on the death of Louis (J74), and lefore the necklace was finished. After luiny mode, this beantifnl omament, subumbly witl 500 diamonds, was discovered to be so costly that mo one conld purchase it. It was valucel at 1, som,000 liveres, which in present storling money is equal to abont £S0,000.

The ]'rince Cardinal dip Iiohan, a wathy, vain, and prodigate man, persuaded by a woman nammi De lamotte, who waited about conrt, that the queen (Naia Antuinette) regaried him with an eye of favour, lecane so infatarter with the idea, that he was realy to do my thing, however extravagant, in oriler to preserve this ferlime in tla. gueen. De Lamotte hal stated to the eambinal that the queen was desirons of olstaninis this shorions necklace, and that not having sulhelent money just then, she would sign an agremont to purchase it if the cardinal would becom" secmrity. 'Th. cardinal consented. The agreement was approved of and signed with the royal sionature, as alsm with that of the cardiual, who, on the Iat Falmuery 1766, carried off the 1 reasume $t_{0}$ Versinlles, where it had been agrees the queen shonld semel fin it. On the following day, a person, lressed in the miform of one of the court valets, entered the apratinents of the combinal, and repeating as he enterod the words, de pror lie reine, 'in the mame "f the queen,' lue advanced to the table whereon the casket containing the treasure lay, and hove it atway. In a fow days De Iamotte, her husbaud, and the sui-disant valet, having all disnjly rared from Paris, were busily engaged scparating the dianond necklace into portions, and selling them. 'The whole transaction had been a trick; the messuges from the queen, verbal and written. were withont funmation. the latter, indeed, being formed by the "valw,' who was skilled in imitatins hambinting. The plot was discovered ly means of the maker of the diamond necklace, who, not reccivise any money when the period of the first instahumt had arrived, went to court, Immanding to know if the necklace lam been delivered to the gneen. In a few months the cardinal foumd limsclf in the lonstile, where those ly whom ho hal heen duner were already sent. In May 1786 , the trial of the [risoners was brought to a elosis. The lamottti was bramed d on each shoulder with the letter F (for relcuse. thief), and was sentenced to lee imprisoned fur life. All the wthers weve acquitted. The queen was falsely supluesed ly the pupulace of Paris to have been implicated in the plot, and the mFinm resulting from it was cast upon her, even at the last,

Whon whe sat on the rant that lirur lar through a raging and "usiner mora to the grillotim".
 must of low attribumes tu the Grmem Artemis.

watched over the sick, and helped the monformato. lomer girls, and womell in childoirth, were tlat ohjocts of her apmerial cetre. She was harscelf heyomel the allurements of lose ; and the ministors of lur worship were vowed to lives of the strictest chastity.
 as the growless of the moun; hemee lur farek mame: Arkne, aml her Latin names Lurime ami I'mlo'. Ilu* worship was conheterk with splendid rites in dillument eities.  necupios it leantiend sitnation on ath isnlat...l hill "verlumkine the river C'alore and in thu fertile vale of bian, which takes its name from the town. It has a enstle of som, strength, suveral churches, ami it promlation of 7010.

1)IAPA'sON, a term in music ly which the ancient lircelas ensigiaterl the octave. In modern
 pass of the voice, or of an instrument. The leremele use the term as equivalent to putch. Diaprasun is
also the name grven by Encrish organ-bwillers to certain stops of pipes in the organ, of eight feet pitch, whel are consilered the fundanental stops, of which there are generally two-a stopped diapason and an open ditpason on each manual. See OfGAN-bUILDiNG.

DI'APER (Ital. diaspo), a term derived from juspor or diasper (see letter D), which stome being much used in ornamenting jewellery, originated the Mid. Lat. name claspous, for a textme ornmmented of rariegated in an aualogous way. In textile manufictures, the term is applied to fabries with ratterns of geometrical regularity, such as are produced by the kaleidoscole, woven in their texture, and produced with shafts and heddles, withuut the Jacquard machine. In Arehitecture, DLADEL-woek of DLAFERLYG, is a kind of decoration aprlied to plane surfaces, and consists of a small pattern cither of flowers, leaves, or arabesques, carved or painter. The flower, or other object, is generaly encloser in a smail

Disyer. frame; and these frames, which touch each othor at the edges, constitute in themselves a sort of mathematical diapering When the pattern is carved, it is generally sunk; and when painted, it consists of a clarker shade of the same colour as the plane surface, by which the effect of shalow is commmicated to it. The accompanying illustration, from Dloxam's Gothic Architecture, exhihits a very beautiful example of deeorated Eartish diapering It is taken from Canterbury Cathedral.

Itapaté is applied in Temaldy to fiedds and charges, relieved by arabesque and geometrical pattorns. These patterns were generally of a darker shatw of the same tincture. This beine merely an ornamental rievied, wot atfecting the heraldic value of the nhjects to which it was applied, was generally left to the faucy of the painter.

DIAPHAXOSCOPE (Fr. Tiaphanos, transgarent: slopero, I sec), a dark how, suitably constructel for exhiliting transprarent plontograjps or "thw pietures. It may or may not bu furnisherl with a leus.
D)APHOMESSS (Gr.), the cutaneous persira. tion, whence

DIAPHORETICS, remedies to excite the secretions of the slin. The simplest of all biaphoreties are baths, which may be cither warm baths of water, or of bapour, cither simple or medicated. See Fistar, Tho most poworfil of all, lowever, as regarls mheines perspiration, is probably the so-called 'Turkish bath, which consists esschtially in the ase of a swoatiner yroeses, by means of air heated to a tomprature of $140^{3}$, up even more. The followins remeries, usal internally, are powerful diaphoreties: antimony, ipocacuinha, opimm (these three cither singly or in eombination); ammonia, and the carhonate or ucetate of ammonia (spirit of mindererus), surza, guiacunn, dulcantira, ant] sassafras. On most of these sulnstances, sperial articles will be found. A farourite formmia is lover's powiler, consisting of at train of glum, sum a grain of ipecacuanlar in ailell ton grasins of tha" lwowder. Ihis in closes of from tive to right grains, followed by warm drinks anl phaty of blankets in bed, usually produces e中phna preppiration, and is very soothing and nsefn] in many commencing inflammatury and febrile
complaints. James's powder, in loses of from three to (ight grains, is often added to the above in domestic prescriptions: but neither of these medicines should he used rashly, as in eertain states of the system they may prove dangerous; and they should never le given to very young children.

DI'APHRAGML (Gr. diaphragma, a partition). This is the name applied in anatomy to designate the transverse muscle which, in man and the mammabia generally, separates the cavity of the thorax or chest from that of the abdomen or belly. It is not easily described, lut will be best understeod by a reference to the aeeompanying figure (fig. I). In form, it is nearly circular ; it is tleshy at its

Fig. 1.-The Diaphragm in a state of repese. Anterior view.
edges, tendinous in its centre, and ending in a point below. In front, it is attached to the ensiform cartilage of the stermm, or breastbone; laterally, to the inner surfaces of the six lower ribs; and posteriorly, to two tendinous arehes on either side, termed the ligamenta arcuata, and to the anterior surface of the bodies of the secend, third, and fourth lumbar vertebre on the right, and only the second and third on the left side; these origins from the vertebre forming two large fleshy be山ies (termed the crura), which ascend to join the central temlinous portion. The diaphragm presents three principal openings: one quadrilateral, in the tendimous centre, for the upward passage of the inferior vana cava; one of an elliptic shape, formed by the two crura for the esophagras and puemoogastric nerves; and a third for the aorta, the azygos reim, anil the thoracie duct.

The diaphragm is in relation superiorly with the phone and pericardium, enclosing the lungs and heart; inferiorly, on the left side with the stomach and splecu, on the right with the convex plper surface of the liver; posteriorly, wilh the kidneys and supra-renal eapsules and the duodenum; and hy its circumference with the ribs and intercostal muscles, with the sternum, and with the vertebral columu.

We see from figure 1 that it is convex supe. rionly, and concave iuferionly. When it contracta, its Huward eonvexity approximates to a plano surfaca, and the carity of the chest being thus enlarcerl, air rusles in to fill the partial vacuun, annl expands the lungs during the aet of inspiration (fir. 2\%). It is thus an inspiratory muscle, and is the sule agrent in tranqua imspiration. The enlargement of the thorade cavity caused by tho contriction of the diaphragm, must obvionsly be associated with a corresponding diminution of the abdominal space. Mence this muscle, by its action

## DIAPIIRAGM-IUARRITEA.

on the alretominal viserra, aids in the exprilsion of the faces mul urime.

Spasmonlic action of the diaphracom proxltues hiccough and subbing ; and in lanfhing, the alternate

contractions and relaxations of this muscle ocenr with increased rapidity. Stopparge of the action of the diaphragm, whether from great extermal 1 ressure or from paralysis, is very speedily fatal.

DIAPHRAGM, a partition with a bole in it, employed, not only in lindseape and portrint lenses for photography, but also in telescones, microseqpes, and other opitical instruments, for the lurpose of cutting off the snperfuons rays of light, and producing greater intensity or shampess of the imare, as well as to correct aberration.

## DIAPHRAGM SHELL. See SHeLt.

DIA'RDEKLR, a town of Asiatic Tumker, eapital of a pashalic of the same name, is situated on the right bank of the Tigris, at a sliort distance from the river, the intervening space being aceupicd by rich gardens; lat. $37^{\circ} 55^{\prime} \mathrm{N}$. , long. $3 y^{\circ} 52^{\prime} \mathrm{I}_{\mathrm{\prime}} . \quad$ The town, which is cirenlar in shinpe, covers a considerable area, and is surromedel liy high strong walls, flanked with towers, and pierced loy fomr gates. The streets are dirty, and the houses for the most part are built of rongh stone, llastered with a composition of mul and straw, but some of the luetter class are of black basalt. It has mumerous handsome mosques, khans, aul hazairs, and five Christian churehes. Litensive manuftetures of silk, cotton, and other croods, atiording, with an active commerce betwecn Aleppo and Bagtad, employment to about 40,000 families, were at one time carred on here : but the manufactures and trale have now greatly declined, ant the popmation of D. does not amount to more than $S 000$ families, 6300 of whom are Turkish, the rest being Greek, Armenian, Catholic, and Jewish. The silk monufacture, which is now the staple, is said to le improring. D. oceupies the site of the ancient 1 mida, which was a place of importance in the reign of Cunstantius, by whom it was strengthened and enlarged. In this roign it was taken by the Fersians, from whom it was again captured by the Fomans; but in 502 the l'ursians once more became masters, and put su,000 of the inhabitants to the sword. After many vicissitudes, it passed into the hands of Sultan Selim in 1.715 , Many Roman and Sarmenie remains still exist here.

DLARRHCE'A (Gir, ria, through, and rheè, I flow), a clisease, or rather a tribe of diseases, char. acterised by in inerease in the discharges from the bowels, which are nsually unduly liquid, sometimes
werelaremi with hiln, and Efmetimes thre contrary. Diamhai lias many varieties and many vabuses ; but
 relations in enmmon, whish have hean atmation of late
 or santary print of wiw. 'Thas it is rossormen of all
 nore ikt to prevail diming smamore ancl antuman than derins the raviner entshas of tho yeare ; ant it
 creat astent dupendent on the intanify of the sular Freat, so that a temperatine above gir) J. sames to be almost assential, umler orwincuy cimom-tamers, to their mbinemic diffusion. Mumener, it lats lan in shewn that the deesmposition of ousanise matters in the: neighbondioot of loman rlwelliness, and thes introtuction of the proninets of slownamasition into the ford, dimb, or air used lyy the lualtly, hats been a dizect excitime eanse of diarrlan in it geat number of instances where the diseas. has $\mathrm{l}_{2 \text { "nn }}$ loeally endemic; from which it is inferreal that the real source of diarmonal iliseases is msually to be foumd in a modsul poison closely assuciated with the froeess of fatrefaction, although not, 1 erlan心, necessarily grucrated durinit that process. It has been noticed that coll and wet seasmes are the lonet faromalile to the production of diarrare, which is explained on the theory above allumed toy hey the rapul remoral in such suasons of all orsanic reboris: and there is bittle tloulat that this explamation is comrect, as the converse is cqually true, the comlination of heat with lonereontimued drousht being almenst sure to waken intw life the apinma seeds of diarrhea, A gain it is noticel that where drainage is imperfeet, ansl drinkins water impure, diarrbocal rlisenses are specially at to oocur (see (MMLEFA) ; the class of the poprulation most apt to be affected being those who occupy low levels, or who are otherwise exposed to the influence of this arpuedms or gasemus loison. Infants are especially ajet tu suffer from diarrinea, aud a large number of tho infontile deaths in many English towns are cansed either directly ly this disease, or by the abuse of stimulants aml nureoties for its cure.

Wiarrheer is either simple, bilione, or choleraie; the last form las abeady been discussed. Sec Chofer.s. The ancients applicd the name limter! to a rlaterhen in which the dejectima consistel of matters not digested, on rery partially so ; this form is, howerer, vory munsual, at sill couts in this country. Dysentury (q. v.) is also a form uf diarthazl disease; as is the furm of fuver ( $\mathrm{f}, \mathrm{v}$ ) ealled sastric, typhoil, or enteric feser. Simple ant bifions diarrhea probably witen differ only in degrec; they are luth distincmishai from the adraneed stames of eholera and dysentery by the presence of alumanee of hiliary colourinis matter in the stools, and ly the alsemee of the distinctive features of the ather two diseases as described Asewhere. Diarhat fropuently depends on organic disense, either of the intustimes themsclves, or of the liver, kilury, of spleen. It is also none of the most common sirmptoms of the advancel stage of consumuption (o. V .).

When diarthua is plainly the enosequence of imponer fool or think, when it is very reeent, when the strengtle of the patient is not much impared, when there is much sriping pain ur distension of the lodly, when the evacuations are Sery unmatural in charicter, and especially when they are dark colomed and very fethe; when the lisease has been preceded by hahitual constipation (q. w.), anl when there is no organic disease to be diseovered, it is well tor let diarrhea mon its conse, at all wents for a time, and eithor to aid it by small duses of rery simple laxatives, or, at all

## DTARY-DIATOMACEF.

events, to abstain from hastily checking the discharge, which in these cases is to be regaraled as a truly curative and heneficent process, calculaterl to disharlen the system of some poisonous or deleterims subtance, and only reguiring time for the restoration of the patient to health. In other cases, espocially of felmil. diarlua, an emetic of apecaenamhat the very becrinning will sometimes remose the disease with remarkable rapdity; and in most forms of diarlhea it may he allegel that this meticine (in inses of from one to tive ur even ten prouns) is well burne. Simutimes it is combined with opiam in the from of Dover's powher. Vegetahle astringents, as catechn, kinn, tamin, mation, lorrmond, are also much employed louth in acute and chmone cases: some prefer the acetate of leal. with ophm (which, lowerer, is frothas mome suitable to (lysentery): It should be ohsersed that in some forms of diarrher the nee of pimm, though a most pwwerful remody, is contrandicated by the state of the constitntion : it should in uo case be largely given withont meatical alvice. In many chronie cases the metallic tomics and astrimgents are of service-e. g, iron, sulphate of colper, zinc, anl lismoth. In a very large class of cases, especially of infantile diarrhoea, dopunling upno a too acil state of the secretions, the leading remedy is chalk, either in powler in in the very serviceable form of the mistura creta (mixture of chall) of the pharmaconnias, from une to three dessert spoonfuls of which may be given after every distmbance of the lowels. Lime-water. mixel with milk in the proportion of one to foru or tive, is easily given to very young chidren, and surves wearly the sime purporse.

1HARY (Lat. Jierrium, from thes, a day), means simply a daily recoral. It does not, however, comprhem every sont of daily record. Mut only such as hase reference to the writer persomally. In it the littroften inseribes the daily results of observation, realines or thonglat; to the mercmatile man, it surves the purquse of an order or day lwoh; while the physician dimds it indispensalbe as a register of engrgements. The nse of diaries has lecome so gencral, especially in England, that the makmg if them now forms an important hranch of the lomk-manufacture. Letts and Cin, of London, issue ammally npwards of a humded varietios of diary. from the large folio to the smallest purk thone The nasal diary may lo described as a lowk with a sprate hank space for every day in the your. thene spaces varying in size amb form, as the particular lent or profession of the dianist may rouler necessary. lumul ul with therse diaries is a summary of the impurtant events of the past yoar. a list of the acts of parlament passen during the previnus session, an commeration of pmblic hombays, torms \&e, a great ammunt eif valnalld. information reraring labking and insurnce hosinuses, with a vaist quantity of miscellanemos menuramba, so that the puprictor foussenses in me lowlt a liary and an almanal".
biarios have often furnished the historian with invaluablo matorial, sumplyin the absence of pulbice reworls, ame furnishin! minnte aml graphic details of thas secial combition and of the secret an ings of fuldia crents that are mot toln lowked fur in more fimat recombe. lerheps tha most motalle in this resenct are the diarien of Exaly and Fepys.

 half tome and the small limems, or the rimatimer when the lather is subiracten from the formo.

and the syntonic comma, also 2045 : 202. The diaschisma and the small limme addel together always make the greater half tone, or $16: 15$; and the symfonic commin aulded to the diaschisma always make the diesis, $125:[25$.

JIASTASE is a peculiar ferment developent during the germination of all seels. An impure sulution of diastase may lo procured by adding one part of low water to two pirts of ground malt (sec Dbef), us freshly germinate 1 barley, and, after standing for a short time, straining through a cloth. The proportion of diastase in malt is not more than 1 part in 500 parts, and yet it pexforms important functions. Thus diastase has a powerful action unin starch, and at a temperature of l50 Fahr. one part is considered powerful enough to change 2000 parts of starch into dextrine, and then into mapes susar. When oltained separately, diastase is in white tasteless suhstance. Sice Geminstion.
dhatilérmanous. Sce Meat.
IHATHESTA (fir, dit, throngh, and tithemi, I dace on arrange), a firet word signifying a disposition or arrangement, and applied by the oll medieal anthors to the promispsition or constitntion of the hony which runlers it prone to cortain diseased states. Thus the tubereular, scrofulous, gonty, hemmatic. cancerons, or calculous diatheses, are described as something different from the corresponting diseases, but leating to thesc as natural ar prolable conserpuences, umler certain conditions or exciting causes. The study of diathesis apart from existing disease, bowerer, is amost always nusatisfactory, and leads to over-refinement and the pursuit of intangible abstractions, withont due regand to evidence: imasmuch as the existence of a state which is mot lisease, lut leuls to disease, ean rarely be established umen an massatable basis.
 organised beings, now generally regarded as belong. ins to the vegetal, . Finglom, and ranked as a sulb-mater of Alyme lint formerly reckoned among animaleldes, a viow of their mature still entertained b,y sume maturalists. Limuley makes D , an oriler of lis Aly+h Allime of thallogenous plants, including Irmidieer ( 1. . . ) as a sub-order, and distingrishing the true I. as another sub-orler, under the name ('ymbillece. The I) are gencrally of a hrown colom, although they not imfrequently become greenish when dry. They are remarkathe for their silicions cobering. compusel of two pieces or valves, and their anmar shape and are among the most heatiful and inturesting of microsconic olijects, exhibiting Ireat variety of markings-strim, dots, \&e--regnlarly and symmetrically arranged. The valves, "10 picees of the silicions covering, are always equal in langth, but their sides often diflier much in headth. All within appars to lu. only a single cell; lont many of thase cotls are often iunited or in contact, acording to some monde of arrangement charaeteristio of the particalar species. 1) are foum hoth in salt and fresh water, alse on the surface of ramp ruck and walls, garhen-pathes, fluwer-pots, the glass
 in ereat mombres by allowiner water in which they exist forstand fur a fuw homs, and then pouring oif all except tho mene mudny or slimy part at the luathm. They may ufturn beren to move a little in the water or slime in which they exist, particnlarly thas of mast dongated form; and this was nere regamed as a bery anclusive evidmen of theid animal nature, hat is any lelined to be nu more so than the bumements of verentale gosespres,
 fluids in the pronerses of their veratable life. They increase ly division (whence the natare diatomaces,
 versely but lonsitminally ; and the hines which mark its progress are almost alw:ys visible in them. In
 the line of division, the old valves remamine on the onter sides, and each mow diatom edl having an mat valve and a new whe. Tras remonhetion takes place ly (sonjugation (1. v.), tum by the formation
 thme silicions shiulds resist decompusition hume perfectly than alnost any pronuct of upanie nature, and are foum in immense mumbers in many mats, clays, ant rocks. Thay are ealbahdo of resistimy even the action of lire, and of the gastric-jnice of the stomachs of animals, and are fomint in fumice and voleanic ashes, and in unano. The ahmutano of the D. as existing organims, corvespmis with what we infer from their remains in the oolite, chalk. \&e., as to former geological prinks. Jinitain is known to possess huntrals of existimer suecies. Ir ILenker fromed then in such munabers in the Antaretic Ocean as to give an whreons hrown embur to its surface as far as the cye combld reach, and to the icebergs forating in it; whilst a summarine deposit is in process of fomation, composen of that silicious shiths. Thas these minute oryanisms, umimportant as they may le decmen indivilually, fill no insignificant flace, collectively, in the general schome of creation.
Forsil D. have been ohserven in strata of nery age. Thongh so minute in the individual, they form, in the aggregate, considerable thicknesses of rock-they lave, in fact, in chmmon with the associated and nearly as minute and simple oremisms of the animal kinglom, the Foraminifura, produced grater changes, ind luft nume lastins reconds than any eflecteri by higher mombers of cither kinghom. In the wher rubles. I). have mot been moticed in any 'ruantity, their existener. however, in the clay-slates of the J mwer Milurians was discoverel hy Mr A. lóryson, and has beem sulase'Inently notieed ly other ohservers. in 'Tertiary strata they oceur in abmeance. There is cromil reasun for beliering that the silicions sulstance of flint was olstainel, to a larese extent, from these organisms: many of their finstulos may yot he disemed in it. Tripuli-stone consists entirely of their silicions plates, hence its value as a polishiner agent. Several extensive sleposits. of trinuli are foum in Bohemia-nm at bisea is two miles in length, and aycrages is fere in thichness: another at lisin, forming the upher layer of a lill, is 14 feet thick; it is compuserl chidly of $a$ someies of Ginllionelle, with specmens of Fiemiculte, \&e., as many as forty-oue therasand millions exist in every culic inch of the stome! The city of lichmond, in Virginia, is lunilt on a stratma of slatomacems earth, is feet thick. Similar levosits are fomen in dilferent lowalities in Iritain, as at l'remnar, Bolnelly, Lough Mourne, Laasay, and Mull. From the last locality, (iremery las siven a catalogue of 150 species. "The whitish powder of which the deposit consists is called in fiweden lieqrachla (I. v.), and is, in seasmen of scarcits, mixed ly the poor with their fool, though probally without any ulvantage, save increasing its hulk. 1). necur in more or less ahmolance in marl, peat, guma, estuary mul, and other recent depusits.
DIATO'NIC, a term used in the science of masie, originally from the "(ireck, meaning "hy tonces, we 'from tone to tome.' The diatonic spectes if the ancient Frecks-apart from their chromatic and enharmonic species-formed the fomdation of their whole systen of mosic, and was arranged in tetrachords compused of one semitone and two whole tomes. The diatonic scale of modern music

 of the semitumes barymir, as the sciale is major or mina.

DHDISLRANE DIDDLINA, Ther commongarden diblk is an implement too well linnory to rerpare any lengthoned ikscription. Aromal pece of wom, about an inch and a half in dianctor, sharpened at the puint, is the most simple and common form. To allow it to he more casily pressed into the sromme a hamine is manally ahbed. 'I his is all that is meeted for a ramion dibhbe. In somu parts uf Enclani, where falnur is phentifu, large limadthas of wheat are put in with the diblle. Sereral diblles are usmally juined twgether, and made of sutficient leweth to mable a man to preriom the operation, as lo walks lackwarls, without math stomping. Thildren frollons with the seed, and drop two "r theee Erains of wheat in eresy hole. The diblater is witen ustol to put in lutans. liy chlolinge a consiturable saving of sed is dfected. From one moshel to six pecks of wheat is the usual quantity regnimed to som an acre. Dibbling is thonght to le adrantasems for licht lands which are in goud combinin. Shore recently, several ingenious machones fur diblhing have been constructod. The one must worthy of notice is Nuwbery's Hurse diblle, which

## DIBBS-DICK.

sows from one to seven rows, and accomplishes the operation witl great nicety and aceuracy. Eeing an expensive machine, however, it has not come into seneral use. Dr Newingtom has invented a land-diblule, a very perfect implement of its kine?; the same machine makes the holes and deporits the seed at once. 'This has been a useful article on small hohlings, and it is the greatest favomite at the present moment.
bibbles of every kind are unsuitable for stiff or chayey soils; the soil, compressed and hardencd aromml the hole which they make, not readily admitting the young fibres of the ruot, and retaining water to the injury of the young plant.

DIBDS, the Euglish name of a game of great anticuity, played by luys aud girls: amb in Jussia, as is described by Ir Clirke, it is played sometimes aren by old men. It consists in throwins up the small joint-bones of the legs of sheep, and catching them first on the patm and then on the back of the hand. 'The antinuity of this simple hind of play is proved by figures on Grecian vases, on which fenales are secn linectins and engrged in the eport. In Scotland, where the same is more usually played with small pebhles or shells, it is called 'the chucks."

DI'MDIN, CHAFLEs, musician and poet, was hom at Sonthampon in ITA5, ehueaterl at Winchester, aurl at the early age of sixteen made his literary whut in Lomdon, by writing an rpera called The Shepherl's Artifice. Which was 1 nodnced at Covent Giarden Theatre, of which he afterwards became musical manager. In 1759 , he commencet giving a series of musical antertainments in the city, erstitled The lyhim of the Moment, which acouired a great celcbrity: After several vicissitudes, he withFrew, in straitened cirumstances, from public life in ISOD, when suvermment grantel him, in consideration of bis literary merits, a pension of £o00. He died in 1514. 1) is an admimable writer of seasonss, of which be composed about 1200 . Nepotune, and not Apello, scems to have inspined lim. In fact, he is the only somm-writer who has deached the heart of "the marincrs of Enolmal.' His rerses smack of the limy decp, and reflect with astonishing felicity the easy, childilise virtues and the fearless comare of the Enulish tir. It is known that they hal a great effect during the war lutween France and England in sulplying the navy with sulmuteers, and they have even been quated in mutimes to the restoration of andor amb discipline. $\therefore$ mung D.'s hapbiest pieves are I'oun dacl: and Pour Tom Buading. The last edition of lo.'s somes, with a menoir ly T. Diblin, illastrated ly If. $_{\text {w }}$ ('rukshank, appeated in 1850. 1). alsu wrote a creat mamber of dramatic picces, \&e.-Ite lutt two

Spenceriana (1814), Bibtiomaphical, Antipuarian, and Picturesque Tour in France and Germumy (1s21), The Librery Cornuunion (1524), and Reminiscences of a Literary Life (1836). All D.'s books contain valuable and rare information, but are far from trustworthy in matters of detail. Many of them are expmisite in typography and artistic decoration.

DICE (plumal of die), small cubes of bone or ivory, marked on their six sides with black dots, from one up to six in number. Two dice are employed in certain games of chance, such as backgammon ; also in throwing for high stakes, or settling some dispate in which the decision is referred to the lighest number thrown. In this latter point, the throwing of dice is equivalent to what is usually spoken of as 'casting lots.' The throwing of dice is in all cases effected by means of a small tupular box, which, held in the liand, is shaken at will by the player. When the dice are true cubes, there is no plan by which any kind of shaking can brincr out a desireil number. In order to repress ganbling, and secure players against leception, the state, by the Act 9 Geo. IV. c. 1 S , imposes a duty of 20s. on wach pair of properly mate dice, which are accordingly stamped, and inflicts a Ienalty on the sale of those issued without this mark of anthority. Nevertheless, we believe there is a pretty free sale of unstamped dice, under the cant name of 'bones,' at an insignificant price. Unserupulons gambler, as is well known, resort to the odions practice of loading dice, by plugging them with lead on a particular side, that the higher numbers are almost certain to be turned 41p. Where there is any suspicion of this trick, the thrower shomld be requested to turn down the mouth of the box abruptly, to prevent the dice from rolling, and improperly adjusting themselves. Sce Ganbling.

DICHLAMIDEOUS (Gr. dis, twice, and chlumps, a covering), a term in butany, applied to those Howers which have both a calyx and a corolla. Flowers in which the calys and corella are very siwilar, and unite to form a perianth, are dichlamydeons, as well as those in which they are very difierent. - In the system of Decandolle, dicotylechonous or exogenous plants are divided into Dichlamyleous and Monochlamydeous, the former including the three sub-classes of Thalamiflore, Calleitiona, and Corolliflore, whilst the latter form a single sub-class.

IHCHO"IUNOUS (Cr. divided into two equal parts), a tem often used in botanjeal slescription to desinnate branching by repeated forkings. The veins of the fronds of ferms and of the leaves of some coniferons-trees, the stems of some forms, the fronds of some alrae, aml the stems of a few phaneroramons phants, are dichotmonsly bramehed. The stem of the mistletoe is aemerinlly divited in this mammor, iml it is a remarkable claracteristic of that of the doom pridm.
 phlasonner, w:Ls born in 1771 , ne:n Dundee, Scotland, wheated at the nuiversity of Edinburgh, and intemted for the ministry in connection with the Shemsion 'hamels. Ifter a luring pastoral charge,
 woasimal proachom, and anthomship. DOCK BEQUE'S'l', thu name givan to a funcl leoneatled by dames bick of Finsloury Siguare, Lomblon, for tho benolit of the parmehial schome masturs of Moray, banff, and Alerdeen. Ne lbick was born at Furres, Dorayshime, in Novembur 17. I\% Waving entered morentile life in the West Indies at the age of 1 !, he atuasied a considerabie fortnone, which he subsepuently inerensed in London. He died on tle "Pth May lsos, leaving the chief prat of lis fortate for the purpose above mentioned. The sum bequeathed imounted in 1833 to $011:, 747,48,7(d$, since increased to $\mathbb{E}^{2} 20,000$. Thuse funds, beint invested in leritable securities, yiud \{after deatactins all expenses) for annual distribution o sum which amounts, on an average, to $\mathbb{E}^{\mathrm{f}} 0000$. Mr Dick's oliject was 'to encourage active schoolmasters, and gradually to elevate the litevary eharacter of tho parochial schoolmasters and selools.' Aeting on this deelaration of the testator's wish, the trustees in whom the administration leceme vestod* ordained first, that with a view to raise tle literary character of the schoolmasters, mone shonld, after a certain date, participate in the bequest who loul not passed, to the satisfaction of examiners appointed by them, an examination in the Finglish language and literature, geograplyy, arithmetio. geometry and trigonometry, algehra to quadratic equations inclusive, Latin, Greek, history, and chronology. To these branches have lately been adder an examination in the art of teachimer and in physics. To those who highly distinguish themselves in these examinations, a sum of money is awneded by the trustecs, and they are entitled to a small allowance during their term of office. Further, with a view to raise the literary character of the sohools, and to concourage wetiee schoolmasters, the trustees aprointere a Visitur, who shond report annually to them on the comlition of the schools, making a romed of all those schools, whose teachers claim participation, once in three years-now, once in two ycars.

In allocating the fund at their lisposal, the trustees take into eonsiremtinn the number of scliolars attending each sclool, the branches tanght, the fees paid, and the salary fixed by the heritors. Dach of these elements has attiched ter it a eertain value, the object of this beinit to madie it the interest of teachers, leritors, aml ministers to promote the education of the parish. The sum to which a teacher may be entitled in consequence of the prosition he holds, on the lrooks of the trustees in the above respects, is allowed, increasel, restricted, or refused, accoreling to the ruput of the visitor on the condition of the school. The highest sum paid to any teacher in 1800 was $\mathbb{E} 4,16 s$; the smallest, £20, $148,10 \mathrm{l}$; the average, ${ }^{2} 30$, 2 . A considerable number of teachers slo not marticipate in consequence of their having failed to comply with the conditions of the trustees.

There can be no doult that the operation of this bequest has been most alvantageons. There is no district in Scothand in which the parochial seloools are so uniformly taught by bighly qualified? menall being graduates, and very many licentiates of

 to write tho lilmetto for an "presia of Mr Lsulfe's. 'I'lue Pickerd l'apers, which hatl an chmmons connmereial success, commenced alse an era in kinplish literature. It was the dirst of a series of foctitions works exhibiting the life and mamers of $t$ lu. minthe and lower classes, which uy to that time had had searcely any expoment. In one respect, lowever, this book land neither prendecssor nor progeny. Neither before nor since has there ever heen suin a literary empodiment of healthy animal spirits. There is none like it fur unflarging lint never nuwise mersinent-for humour thats is vary much thes reverse of dry. 'That Ar D. lass given us no mone Pidwitk Pupirs is to lse lamonted, hat may lus easily exphained loy the fact, that he never hand the advantare of leing fire-and-twenty again. Sinee then, lumever, he has given us many works more almimalle in other respects. Nichalus Nichlehot, lis next effort, was, as a story meatly in ardyance of it. It wats alsu the first of thonse suctal morels which form sus marliced a feature in moblam litoraturn. It was aimed at the wrouss and erateltios inflicterl unon their wretelied pupils by the chap selumbmasters of Yorkshire-and it lit its mark. Since then ond autlor lass set lance in rest auranst many a social monster. He may be sometinus whomes. hat Le ean searecly be aeconsed of want of homesty of purpose; while puite as little can frartisunship. (except that Ine is always for the porm) le laid to lis charge, since at the very time that the emontry grentlenan were shakiner their heals at hime for his want of reveroneo fur "linne,' le incensed the: manufacturing interest by the publiention of II (tid Times. His sareasm is if a rather pecodiar char-
 notwithstamlins thom indinant fire, that never lose sicht of the lutiorous sule of thiners, his style is mockiner armanent. After Nicholds Sickily came Mentir Humpherys Chet. containins the ohe Curiosity bhop aml Earmony I'ultye. In the former of these, anm in the character of littla Nelly, be first exlibited that power of sotting forth child-life and child-thought which may have leen said prothata, lefore the pulatiation of creorge Idint's works, to lie pecmlinrly his uwn. Liumolay Ratege was his lisst, and, with tle exception of his sulusequent The of Tom Cifios, his only attempt to duscribe the last: aml it was it suceessful ont. It is probahly, with reference to plot anl circumstance, his lest nowel, harring loariel fomorfith. The old ('urinsity ston' buran in a curious ilreamy manner, which, althonsh ohvonsly a farourite one with our author, le soon pererived was unapreciated, and had the prudence to discontinue. This disjosition
of his mind towams the weird aml the grotesque he sulbsequently devclupert with greater success in his 'hristmes storios. After a buyare acruss the Atimatie, Nr 1). pmblished in 1St? his 1 Imerectn Votis for Gonemel ("irolation: but a much more almirable result of that expelition apreared in his Mortin Cluazowit. 'This was certanly the preatest , if his humorons works since the Piokeind' 'opirme, aml it may almost be said to have been his last. Froun this period, his mimal spirits-a rare wift anons evon comic anthors, and ravely lasting so bing as in his own case-aplear to have lleserted him. His hmont, except in some rich creations, such as Mr Nicawber, is nu lumer sw alparent, while, m the other hamd, his wit and pathus have increased. Hombey ame stom was considered a fallinu off in one who stood so hidh: lut lis death of little lombey lrought tears to the eyes of lawyers. When men were expecting that heslond wane and weaken like wther prolific writers hefore him, he problnced a novel as fresh as the dawn. In this, he, for the tirst tume, aloped the antolingraphieal form, and that periaps ullemed him some ailvantages: bat at all "rints, tho result was admirable. Devid Colperfeld is, in mur julrment, by far his greatest work, and will endure-thongh for very different reasons-as long as the Piekwick Papers. Its Agnes is perliaps the most charming female character in the whole ramre of fiction. Clrak Ilouse, IVrrel Times, Little Durritt, the Tale of Two Citios, Grot Erpuctations, and obr Mutand Primel, afterwards succembl one another with almost perionlical punctuality, and an andience larger than any loglish anthor ever han awaited each. No mose-writer was ever more funtable or more quoted than he. Sam Weller's metaphors, Mr Squeers's entucational methoms. Mrs Giampis asscrtions, corroborated hy her moreal frient Mrs llamis, and Mr Micawbers moral and commercial rellections, are in the monthis of all men: while he supllies the newsprame with their hest 'prithets for social and potitical ahmses. In 1855, the Duily Nenes was starteit muler Mr I.'s eatitorial anspices, hat the task appeas to have heen monenial, for he som withelrew from it. $\ln 18$ and, he commenced a weekly periodical, contitled Honlwhold Words, which wis afterwarls mereml inte, All thr Jeme lionerl. Ils
 monished at his death, 3 解 fanc 1500.

1) ICLINOUS (tir. dis. twice, and litene, a bed), a tern in hotany, signifyine that tlowers are monsuxual, having stamens only, ow pistils only, and "Ml"nsed to anonoclinomes "r hermiphorlite. It is much usell ly some butinical authors.

JHOOTYLE'BONOLS PLANTS are those of which the embryo is ordinarily fmaisherd with two serd-Foles on cotyledons (11. v.) "pposite to me anouther, wre with more than two, which in that case are verticillate. In semmal there are moly two

 and the toige portertu. Wha last lacally alected dictator was NI . Inmius Prat, who matered on his "flion "llf t , C . From this time nominel dictators wow flefurntly apointed for the furpose of holding the "hections, but even these tinslly disapperrefi? 2ite me C . Henceforth, in critical times, a sort of dictatorial pawer was conforred on the romsuls by the somate by the well-known formulit: "That the consuls shoulel see to it, that the state shmat receive no damage.' This praction renteret the apmintment of dichetors mo longer necessary.

H'OTLONARY, is merely the English form of dirtionerium, a word not to be found in classieal Latin, thongh of frequent use in that called monkish on medieval. A dictionary is, as every one knows, a book, but, in the widest scuse of the word, its contents admit of mo more strict definition than that they are arraged accordin! to the order of the alplabet, and that every word within the scope protessed to be embacen by the dietionary mast have its poper plaw acoordingy. It may be further said that the dictionaryo in inder to distinguish it from a mere list or intox, must contain "xplamations or information ahmot each worl thens included within its scope, except in cases, of which many examples may be foum in the present work, where it is suffieient to refur for a part or the whale of the account of one word to what is said mider some ather word. There are sweral other terms that are nsel synonymunsly, or uearly so, with Dictionary. The Greek word Lexicom is in common use for a dictionary of languages. It is not entirely so limited, however, in practice as may be seen in such works as the Laricon Juriblion of Calvinus or Kiahl, which is just a dictionary of lioman and fendal law, of the same kiml as Sir Eilward Tomlin's Law Dictimary is of English liw. The word Lneyelopredia las generally a wiler meaning: hut there are often several books "xactly of the same kind, of which smme are called dictionaries, and others encyctopedias. Glossary and Vocalulary are nearly synonymous with a dictinnary of a language : and the words Thesaurns, Cataliguc, Directory, Gazetteer, and ludex, are sometimes used as a title when Dictionary might be not inapplicable.

Dictionaries may le divided into two chasses-(I) dictionaries whose object is to explain words and phrases; and (2) those that aim at giving mformation about things.
I. Dietionaries of language are, again divided into varions sub-elasses or species. The must common lind-what, indeed, is understood by the term lictionary (and the equivalent Greck term Lexicon) when used by itself-is an atphabetical list of the words composing any language, cither explained in the same language, or interpretell hy the correspouding words of mae or more other tanguages. To indicate that afl, or moarly all, the worls of the language are embraced, the name Thescurus (Treasury) is sometimes used. sipeciul Dictionaries contain only the words used hy single autbors, or classes of authors. A chlossuty is a dictionary of musual terms. An Etymologival Dictionary is one in which the derivation of words is the sole or a prominent olject.
2. Dictionaries of things ( ${ }^{2}$ ier. Rev/nörterbücher), or of information, are also of various kinds. When the whole field of hman knowledge is embaced, we have an Alphabetical Encyclopredia. The name

Encyclupedia to "ychepredia is sometimes given to

There is m lime of information, within will or narmew bounls, that may nut bu- dhown into the dictionary form. Dictimarios of apt geotations from the "lassios, the sempenerg, or the fathors, were much in rosme in the bith eraturys. There

 of fortatiotion-in fat, of wery uljest of hamain knowledgo ant mactuee. As dictionarins of thes class are of the stume mature, exompt is th the restriction of that tichl, as Encyolngelias purnay so cafled, we resurve some motice of the ampe important of them fur that head.

Dictionaries of language, in our sense uf the word, are of mondern omgin. The firchs and Romans hal no idea of a book embraciny all the words of their own or any foreing tongere. Chas saries, lowever, of mmsual words and pheasess were arly current. The earliest work of tho kind extant (though much interpolated) is tha: Homeric Laxicon (ix. Lervis Homeriku,' Iomme words') of Apollonius, an Alexamlrine trammarian of the tince of Angustus. Mare extensive conpilations, wheh as the Lexicon of suilas (1. v.) , amb the Etymologirem Mogomm (If. v.). Were made in the middlo ages. A real dictionary becane first prossilile after the invention of printines. A browt ant sure lasis for dreck lexicurraphy was lain ly Henry stephens (if.v.) in his Thesaume (157: ) : the Latin Thescumes of Tolvert Steghens, which did the same for latin, had appeared in Ifinl. I'revionsly to the disenvery of printing, and for some time after, the exphations of Latio words were given in Latin. "The earliest minted rocabulary with which we are acquainted in which the words of any modem languge muswering to the Latin are inserted, is the Pronytorins: P'ucrorum, published hy Pynson in 1499, in which English worls are followed by
 September lsan). Some of the more important dictionaries will be moticed under the heads of the several lauguages.

DICTUM DE KENILWOHTlI was an alict or award hetween King lemry llf. and all those lamens and others who had been in arms against him, and so callet lueanse it was mate at jeenilworth Castle, An. \% Henry HII, coutaming a compmation of tive years' rent for the lands and estates of those who had forfeited them in the relellim. - Comel's Interpeter.
DICTYOAEAS, in Patany, a class estahliwhed by lindlay fon the recention if a comparatively small mumber of natural orders. cenera ant species, usually inchnded ly other butanists amrner Eudoums or Esimifences l'mots ( (q. v.), hat which, whilst they agrou witl endosens in the structure of the embra, difier from them in the stem and leases. The innual hranches or airial stems have inded the endngenas structure, but the rhizomes us sulaterranew stoms more resmine the structure of 'xugen. ous phants (II. v.), with pith, medullary rays, aml wella-like vascubar mudles. The leaves are broad and net-veined, nomally disarticulation with the stem. The must impertant natural orders referred by Limdley to this class are Dionmomeat and Smilncue, and the most important plants belonging to it are the different species of lam aod Sarsaparilla.
DIC'Nobon, the name given by Owen to a gemus of fossil reptiles, whose remains have locen

## DIDACTIC POETRY-DIDO.

found in South Africa. The true age of the rock in which they occur has not been ascertained; the accompanying organisms seem to indicate that it is Triassic. Few bones of these anmals, save those of the skull, have been sent to this country. A complete restoration of one would be a most valuable addition, not only to palæontology, hut to systematic zoology as well; for the numerous skulls that have been examined, have been sufficient to shew that this is one of those anomalons forms which unite in their structure the characteristics of widely different animals. It has affinities with the crocodile, the hizard, and the tortoise, though perhaps the completely closed orbits and the sharp compressed jaws ally it more closely to the lastnamed animal. Its lower jaw also is covered with a horay phate, as in the tortoise. 'The most remarkable peculiarity is the existence of a pair of large sharp-pointed tusks, one from each side of the upper jaw, growing downwards as in the mammalian morse or walrus. The sencric name, meaning 'two canine teeth,' has heen given to them from these sincular tusks, which are peculiar to this gemus. The articulating surfaces of the vertebree are both hollow-a ish-like peculiarity, from which it might be argued that these reptiles were good swimmers: probably they lived constantly in the water, but the construction of the bony passages of the nostrils proves that they must have come to the surface to breathe air. Four specjes have heen discovered.
DIDA'CTIC PO'ETRY, that kind of poetry which aims, or seems to aim, at instruction as its olject, making pleasure entirely sulservient to this. It has been disputed whether or not the existence of a kind of poetry especially entitled to the name dilactic, consists with the very nature and object of the poetic art. For it is held that, to point ont instruction as the peculiar object of one liad of poctry, is to overlook the high aim of all poetry; anll that a poom may be in the highest sense didactic, which yet is epic, dramatic, or lyrie in its form and the Book of Joh, the Psalms, and other poems coutained in the Sacred Scriptures, are photed as examples. In the poems sencrally callell didactic, the information or instruction given in verse is aecompanied with poctic reflections, illustrations, episoles, fo. The Georgits of Virgil have heen the model according to which didnetic pooms have rery gencally been composed ; and the literature of all "Enropern nations contains many prolnctions of this kind ; whilst no subject is so umpromising that it has not found sume one to select it as a poetic theme.

## DhDEMPiIMs. Nee Oposstm.

DIDEROT, Denis, a celebrated French ancyelo. pedist and philosophical writer, was horn at Langres, in ('hampage, Sth October 1713. He was edncatiod for the church at the college of his aative town, and sulsequently at that of D'Harcourt, laris ; bat disliking the clerical nffice, and after having made a trial of law, a profession which he also foume mengenial, he finally resonem, after varions vieissitudes, uron bechaint a littiveteno. Fur some years, however, his numbe of life was rary precarious. On one occasion, being raluced to the great ost extremitios, he serionsly risolved that if the worled shande ever prosyne with him, he, not ignorant of misfortunc, wonla never dispenarel the aphications of the indigent. This rusolution was relicgously lent; for after having attanme a pasition of comprative afflenese, he was (rntimatly sumpandod by aphinants desmons of ohtaininy assistanes, which, whenther in the thatur money ur instruction, D. was always willin: (t) aftord thmin. Althnogh bery pour, 1), marricil
in 1743. Necessity now drove him to inereased exertions. He translated the History of Greece from the English of Stanyan, recciving for this work the sum of 100 crowns. Soon afterwards followed the Essai sur le Merite et la l'ertu; the Pensées Philosophiques, written, it is said, in the space of four days; and the Interprétution de la Nature. Shortly after appeared his Lettre sur les Arergles, for the writing of which he was confined three months in the prison of Vincennes. Believing that it was, among other things, his vocation to regenerate the theatre, he produced a melodrama (1758), entitled Le Père de Fumille. It was unsuccessful, and was followed by others equally so, so that it was said, 'Le l'ère de Famille a éte le père d'une fanille déplorable.'

But D.'s great work was the Encyclopedie, of which he and D'Alembert were the joint-editors. It was commenced in 1749. D., besides revising all the articles, wrote the departments of history, of ancient philosophy, and of the mechanical arts. He also wrote art eriticisms from 1765 to 1767 , shewing a readiness in interpreting the meaning of a picture, and a power in reproducing it vividly in words, unequalled by any writer of his time. Towards the latter portion of his bife, D., who had never been able to save any money, determined to sell his library, to provide for his only daughter. The Empress Catherine of Fussia, baving been informed by her French ambassador of his intention, bought the library, on condition that D. himself should be librarian, and undertake the care of it at a salary of 1000 francs yearly. In 1773, he set out for St Petersburg to thank his imperial benefactress, returning in the following year. But his health, which was impaired by this journey, soon after gave way, and he died on the 30th July 1784.
U. had worked at the Encyclopredia for the space of about 80 years. His fitness, natural and acquired, for this species of literary labour was complete. With the advantage of an excellent education, he had a great love of truth, and a curiosity to ascertain the real relations of any subject upon which he was engaged. He was distingnished by a swiftness and dexterity of intellect. that enabled him to catch the salient points of his topic, and to present them in the best light. As regards religion, D. was an atheist, sincere even to fanaticism in his opinions, and anxious to indoctrinate his countrymen with his own scepticism. The Encyclopetio became a velicle for the indirect propagation of his views. One of the last recorded sayings of D , is very characteristic: -The tirst step towards philosophy is incredulity; hut unfortunately $\mathbf{D}$. thought it was also the list. Il is two most powerful tales are Jorues le Fataliste abil Le Sroen de liomenu-both pmblished aiter his leath. 'The secoud was translated into German by Gocthe.

DIDO, a RLASSA, acombine to the legend, the fommiress of 'arthage, was the daughter of a ling of Tyre, called by some $A$ renor or Belus, by whers Mut oro or Matgenus. His suceessor, H'ygmalinn, the bother of 11. nurderent her hushand and male, a pripst of Herenhes namod Accrhas; by Virgil, Sirhams. With the treantures of Nichaens, Which l'ygmalion hal songht for in vain, and aecompanid ly many Tyrims, D. escaped to sea. She landed in Arica, not far from the Dhenician colony of lituca, and built a citadel called Ryrsa (from Sir. Bums, the hide of a hull), wa a piece of cromad whirlh she had lought from the Numidian King Hiathas. The meaning of the word byrsa, Have rise to the legend that I) purchased as much lamd as contd to emocmpissed with a bullock's hide. After the amembent she cut the linde into small
thongs, and thus enclosed a large piece of territory. Here she built the city of Turthare. 'To avoil being compellat to marry Hiarlas, sho stabbed herself on a funeral pide, which sho hat ransed to be erceted, and after her death was honoured as a deity loy her subjecte. Virgil ascribes the death of D. to lier unrequited passion for Aeneas; but many of the ancient writers conecived that the poet had committed an anachronism in making $\mathrm{h}_{\mathrm{n}} \mathrm{r}$ cons. temporary with the Trujun prince. The nore gencral opiwion was, that D. Jad hailt Carthage somewhere hetween 50 and 100 years before the foundation of Rome.

DIDO'l, the name of a celcbrated family of French prirters and publishers.
D., Franȩors, the first of the family that attained eminence, was born in 1659, and died in 1757. His principal professional achievement was the puhlication of tho royages of his friend the Abbe I'revost, a work in 20 volumes, perfect as regards the text, and enriched with a great number of engravings and geographical mals. D, had eleven children, of whom two-Fravçois Ambrotse D. (born 1730, died 1804) and Pierre Frangois D. (born 1732, died 1795)-acquired considerable distinction as printers. Hevrt D. (born 1765, died 1852), eldest son of Pierre François, made himself famous as an engraver, letter-founder, and mechanician. He was 66 years old when he engraved, for his well-knowir ' microscopic ' editions of eminent authors, those characters which are the ne plus ultre of typographical art. A daughter of the third son of Pierre François married Bernardin de Saint-Pierre, who was for some time associated with the Didots in their paper manufactory of Essonue ; and in his country-house near this pilace wote bis Paul et l'iryinif. Preree D., eldest son of François Ambroise (lorn 1760, died 1853 ), still further increased the fame of the family, His Louvre editions of Virgile, Horace, Racine, and La Fontuine are magnificent. At the Exhibition of the Products of Industry in 1801, a jury declared his Rucine to be 'la plus parfaite production typographique de tous les ages.' Besides a great number of works, not less remarkable for their typographical perfection than for their literary value, such as the I'oyages de Denon, D. published a collection of the French chefs-al'ouvre, dedicated Aux amis de l'Art Typographique. D. was also an able littérateur.
D., Firaitw, brother of the preceding, and son of François Ambroise D., was hortu at Paris in 1764. As a printer, and especially as an engraver and founder, he raised the family name to the pinnacle of professional eminence. The absolutely perfect liomau characters, used in the Louvre editions printed by his elder brother, were engraved and east by hin. Firmin D. applied the stereotyping process to the Logarithmic Tables of Callet, a work that required to be executed with the most rigorous accuracy, and which, through this means, is perfectly free from error or blemish. The whole of the French, as well as most of the Itabian and English classies, were published by him according to the same process. These stereotypic cditions (the word stereotypic was invented by Firmin D.) were wonderfully correct and cheap; Fingile is without a blemish, is ornamented with vignettes, and was sold for 15 sous ( $7 \frac{1}{2} d$. ) ; it was a Eind of revolution in the book-trade of France. The most distimguished foreigners were accustomed to visit D.'s establishment as one of the great sights of Paris. The Emperor Alexander, when in Paris in 1814, minutely examined every department of it; and placed under D. two young Russians, to he instructed in all the branches of typography. Same of the most celebrated continental printers served their apprenticeship with
him. In 1827, Fimmin 1. retired from business, to devote himsolf wholly to his dutios as díputi. A
 materate and constitutamal opmosition, homber by Royor Collawh. I), also whained monsumatalderepho tation ans an anthor loy his trayenlios, Le limine ie

 the preceling, the first, hirn eltha December 1700 , the second, Ilth March I79I, nuw "arry on the family business (ailed by their soms, Pate and Alfred D.), ander the firm of Firmin Widet, fier's. In their hands it still retains its mannitules and importance.

DIDY'MIUM is a very ram metal fund in the minerals Cerite, Allanite, \&c.

DIE, $\mathrm{S}_{\mathrm{T}, \text { a }}$ town of Fronce, in the lepartment of Vosges, is situated on the Meurthe, an miles nurthcast of Epinal. It is hamdsomely built; its strents clean and regular. D. is also the seat of a hishorn, has an old cathedral church, and various important clucational institutions. It has manufactures of cottun gools, with some trade in corn, catila, flax. hemp, paper, irommongery, \&c. There are coppor: and iron mines, ironworls, and marble quarries in the neingbowhool. Pop. 6730.
Dibirfenisacif. Joh. Fried., a celehated surgeon of recent times, was born in künnesserf. in P'russia, in 1792. He had begun the study of theology when the war of liberation broke out, in which he took part as a volunteer. In 1816, he cxchanged the stuly of theology for that of medicine, and especially surgery. After studying at honn and elsewhere, and travelling in France, he took his degree in ISㅇ․ and commenced practice in Berlin, where he simn attained distinction as an operator, and in 1840 was promoted to be professor and director of clinical surgery. He died in 1947. Besides eminent skill in all the usual operations with the kuife, D. introduced many improvements, particularly in the art of forming new noses, lips, cyelids, and the like, as well as in cutting the muscles for squinting and stammering. Of his writings, we may mention Die Transfusiun des Bluts und der Einspritany der Arancien in die Adm (Berl. 152S) : Uber die Durchschmeithng dor Sthmen amb Muskeln (Berl. 184I) ; Die Meiluny dos Stuterns (Berl. 1841) : Die Operative Chirurgie (12) wls. Leip. 184. 1845), his chief work, which has twen translated into several languages.

DÏE'GO, Sax, the beat hartume in Pumer or American Califorma, next to that of San Franciseo, is in lat. $32^{\prime} 43^{\prime}$ N., im long. $117^{\circ} 8^{\prime} \mathrm{K}$. It is 6 miles long, and raries in lreadth fron 1 to 2 : and it is 6 or 7 fathoms deep, even to the shore. There are two towns on the bay, distinguished as 1/id and $N e w$, of the same mane the former bemp Spanish and the other Anglo-Saxom. The trade of the place is consideralue, the forem arrivals in 1851-1852 having been on vesspla, of 19,016 tons. The soil around is fertile, anl the staple moductions are barley, maize, wheat, shecp, cattle, and horses.

DÏELYTRA, a remus of plants of the matnal order F'umariacta, in appearance and habit much resembling fumitories of extraordinary size. D. spectabilis, a native of Siberia and the northern provinees of Chima, was introduced into Pritain from the island of Chasan in 1846, and rapidly beeame a gencral favourite, on accomut of its lony racemes of drooping delicate, rosy-pink flowers. It is now to be seen not only in green-honses, lut, as commonly

Diclytra Succtabilis.
Iritain it seldom attains its fnll luxuriance in the opea air. It is cone of the favourite plants of the Chinese.

DIEPENDECK, Apraman vin. a distmgushed Flemish painter, was hom probably in I60, at llerzonenbusch (Bois-le-Dac), and at first contined himself to painting on glass, in which he acquired the reputation of luing the first of his time; but having conceivet a lis, ust for this kind of painting, on accoment of the eracking of the glass, which he conld in no way prevent, he ahamloned it, and became a pupil of linkens. He thon went to Rome, and on his return to Pelgium became a sort of assistant to his master. In 1611, he was elected President of the Antwerp Acaleny: an homour which he retained till his sleath, in ) $6=\frac{2}{3}$. J) painterl much, and with wouderful facility, on tapestry and wainscotting. Jle cortanly imitatel linlens, hat with great freerom and force of colouring. 1 li is works consist, for the most part, of iesigns for titlepares theses, devotional suljeets, am the decoration of Towks. They exhint great fortility and liveliness of genins, hat are in general hurfiedly and imperfectly finishowl. His master-puece in this way is the Tublraus du Temple dis Muses (1'aris, Dis, ) is seriss of designs, 59 in mumber, ensraved by the best artists of the time- Blocmart, Analtram, \&e. These of leblorophom, Oppheus, the Dinscuri, Leamer. \&c., hase been promomeed monspassed. His oilpaintines on canvas are few, lout the churches of Autwepp lave many wimbows painted by lnm. (1). resided in England for sone time durine the retign of "harles $1: 0$ and paintel sevoral lamdscapes ani animals for William Carombish. Dube of Noweastle.

Hellobe, as salurt tuwn of France, in the departbunt of seme- Interienes, at the month of the riser
 10\% 5 . B . is situated lutwern two high ranges of challs diffs, is regularly built, with tellarably wid. rlean strocts rmaniag parallel to the sea; and the lomses-lmilt for the most part of stome anm bonk, with high alanting roofs- have a jucturespue aphatame It is walled, has a castle explpying at hoth dinf at the west end of the town, which it commands, as w.ll as the harbome, which is sitnated to the northetast, and admits vessels of bow toms burbion. West of tho ald e:stle lies the liftle fishing End an of Pollet, far from leatiful in :pheasure,
but exceedingly interesting from the fact that the inhabitants differ in linguage, manners, and costume from the rest of Upper Normandy, and are supposed $t$ or be descendants of those Saxons who settled on the French eoast during the period of the Merowimgan kings. Some interesting listorical associations attach to the castle of Dieppe. Here Henry 1V.-the peoute of D. having been the first to acknowledge his right to the throne of France-retired before the forces of the League, mevinus to the decisive Lattle of Argues, fought within fom miles of D . ; and here the Dnchess of Lougueville, so moted as a lealer of the party of the Fromle, songht refuge for a time from the myal power she had defied. The castle is now occupied as a barrack. The other principal luildings are the churches of sit Jacoues and st Romi, the theatre. aml a bathing establishment. The town has several sipures, and is adorned by nearly 70 fonntains, whel derive their suplly of water from an argerduct about three miles long. D., heing one of the principal waterimephaces of France, has a great accessim of visitors during the summer months: and a large number of hats for the accommodation of bathers, hathing-machines hemer dispensed with, line the slores. The manufactures are lace, fine linen, and paper and the carven articles of hom, lone, ami iyury have long been famous. There are also ship-luilding yards, sugar-refineries, rope-walks, and distilleries; and the tisheries-both const ind Newfumbland-are important, almost the whole of the population of the suburb of Pollet heing engared in them. D. is a farourite landing. place of English tourists visiting France. Pop. 17.506. The rise of Havre has greatly ingured the trable of Dieples.

DIE'SINKINr, the art of engraving the die or stamp usel for striking the impression on coins, \&c., and for stamping thin plates of metal into various devices.
The inportance of the-sinking has much increasel of late on accomet of the great extension of the pucess of stamping thin metal. Nany kimels of work formerly bent into slape hy the hammer and funch, are how struck ly a few hows betwcen suitalide dies. As examples of these, we may mention the ommental work of gas-fittings, windowcurtain conices, common jewellery, ornamental trays, lishes, luxes, \&e. For such purposes, a pail of ilies is required, one in relief, the other in intaglio, amb the metal is pessed hetween them. Not only are mmamental articles stampal in this manner, lut nscful articles, composed of many purts, are mute intirely by cotters and dies, cach part being cut and stamperl liy a pair uf dies, and then the parts mated by another pair, the jumetion being effected by overlaps, which the miting dies press into their phates. Sice bertoxs. 'Tha antomshing chapuess of many of the Birminglam prowluets is mainly flue to the use of dies for domer liy a single blow the work that formerly reguirad fons and tedions mamipulation.

"The must ancinet and faninir application of dies, is in the striking of coins and metials; the method of sinking the dis's nsem for this purpose will serve to illustrite the wom ral methon of die sinking suppose the erom to le of the size of a shilling: a cylindrical phere of sted, about there or four inches im Iength, and two in dimacter, is prepared by slightly romming one coul of the cylimder, then turning and smonthing mon the midill. of this a flat face "qual to the size of the coin. This blank dice which is rarcinlly sufumed, is then mgraved with the A-vice of the cuin in intaglio. 'This is a very delicate and artistic process, abl is oflectolly a areat number of carcful toreches with small and wey haril sted

## 

tonds. The face of the die is nosw hambenal by
 of bone- lust, or a mixture of elarenal ind all. In this position it is raised to al ehery-reol hoat, dhen taken ont, and phamend in water. When pronery tempered, it is in a state to he usch for stantinger the coin; hut dios of supurior workmanshap, from which many impressions we recpured, aro mot thas directly used, as the exjunse ut mgrasing is very great, and the risk of hereakage eonsidered)n. This lirst choraved die, called tha matrix, is thomfore reserver only for makines othor diess. An immersion in relief is made from this matrix on a small bands of soft steel, which is called the pmachern ; this is retonched amd hardencel, and from it tho dios
 impressed.

When the engraving is not very enstly, a somall number uf impressions requireal, or a soft metal is to be stamied, as in livery buttons, for example, thu work is stamped direetly from the ensraved die of matrix. When the device is in hierh relof, and the metal is hard, many heary hlows are reguirent. Some of the fmest large bronze modals require two or three hmmired blows for each impression, and the medal has to be annealed by heating between every two or three blows. It is on this aceoment that the dithrence between the price of pewter ann hronza medals of the same sulbject is so mreat, the pewter being so much softer. Copper, thoush harice than pewter, is much softer than lromze, and henee the reater will easily understand why the deviee on the new bronze coinage, now in eourse of mannfueture at the new mint of Birmingham, is in nuch lowed relief than the old copper comage, as it would not pay to use repeated hows and annealing in strikims common coins. An impression in high relice ar derep intaglio may be obtained ly a single howe by the chiche method. For this, a fusible alloy is used such as type-metal, or still better, an alloy of 2 part bismuth, 1 lead, and 1 tim, which fuses at about $21: 2$ and becomes pasty before solidifying. The metal is poured into a lox or tray a little larger than the die, and when in a pasty condition, the die is placer osel it, and struck smartly with is heary mallet wn eoining-press. A steel die is by no means nreessiry for this: sharp impressions naty be whtained from bronze medals themselves, on even from wom and blaster easts. A eliché moulal may be made in the first instince from the medal, and then a eliche relief from this mould, if the process is skilfully combucted. The skill required consists mainly in striking the blow with a force proportionate to the depth of the impression and the softness of the metal, and in selceting the right moment for loing so, just as the fused metal is on the point of solislifyiner ; for, if too fluid, it will merely bedriven aside: anil if at all set. an imperfect impression results. The metal should] be of abont the consistence of melted sealing-wax, and then the surface is set by contact with the eonl die or medal, while the borly of the metal still yielns to the pressure. Cliche moulds are anhmially alapted for electro-depositing.

DIES IRS, the nane generally given (from the opening workls) to the famous medieval hymon on the Last Jirgment. On account of the solemngramelen of the ileas which it brings before the mind, as w"ell as the lecp, and tremblong emotions it is fitted to excite, it soon fomed its way into the litursy of the chureh. 'The antlorship of the hymm has houn ascribel to Cregory the Great, St Bernarel of Clairvaux, Unbertus, amd Frangpan, the last two of Whom were moted as churdh-hymaists: lout in all probability it proceded from the pen of the Franciscan. for the mear and tear of the tissues which is perietually going on, and as at the same time to licel, up the animal heat at its proper standard. Varions classifications of the fool of man have been at dillerent times proposed, but those which have been most generally accepted are that of Dr Proutin which the different kinds of food are gronperd in definite chemical classes-and that of Lielig, which las reference solely to the udimate destination of the fool in the animal economy.

Dr Prout classities all kinds of food under these heasls: 1. The ayucous; 2 . The saccharine; 3 . The oily or oleaginous; and 4. The alluminons; to complete which, we onght to add 5 . The gelatinous, and f. The suline-whilst Liebirg makes only two classes : 1. Those consisting of nitrogenised matters, which are allaped for the formation of bleod, and which he terms the plustic elemunts of mutrition; and . . The non-nitrocenised substances, which from their large amome of combon, serve (as fuel) to keep up the animal heat, and which he names the elements of respirtion. In pare of the terms employed by Lielng. Dr R. D. Thomson bas suggested mutritive ant culorifucient, which are on the whole preferable. Although Lielig's view embraces a great general truth, there are numeroms obvious exceptions to it; thus, for cxample, whole races of men preserve their bealth who live on animal food alone, containing no non-nitrogenous compound except a little fat; and when the flesh is daied in the sim, as is often the case, eren the far must melt away. We shall therefore alonit Prout's classification as the more patctical of the two. It was based on the consideration, that the milk (the only single article of natwal food that serves to support the animal body) is male up of substances which may be taken as representatives of his grouls; for this, our carliest matural diet, contains water, sugar (representing his saccharime group), butter (representing his wearinous group), caseine (a nitrogenons matter very similur to alhumen, and representing his albuminous groull), and salts ; and recent researehes have shewn that the folk of the erg, which serves for the nourisliment of the chick or other young anmal lufore birth, similarly contans one or more representatives of the aqueous, saccharine. oleaginous, albuminous, and saline groups.

The shall now brietly consider these individual frimps, and the uses to whinh the substances molubled in them are applied in the anmal economy.

1. 'The urucons group' includes water and all the fluils which we use as drinks: and we must adhitionally bear in mand that all the varieties of animal and vegetable food whicle worm solins, in reality contain it, generally in great abundance: thus, for example, unemkell beef contains from 70 to bol per cent, and some regetables even a larger proportion of water. The uses of water are sutlicicntly obsoms from the abmulauce in which it ocenses in all the most inportant flumes of the lmity, as the boun, and the varions digestive thads. See

2. 'The storhorine gronl' inclules the slifferent varietues of suequr, starell, gimm, and cellulose, tometlex with vinegar. I'his eronle is chemically chatareterised by all its nembers lume includel in tho formmar ( $i l l_{1} O_{n}$; that is to suzy, they consist of varlan. twrether with hydrogen amb wxyene in the junnortions in whin thase elamonts form water.
 recersme the mame of Cabho-hydrates.

Of the sughes, mapersugur wr aronse is the most impmotant, fartly from its frepurat uecumence in frimary irtiolen of food, such as froits of most
 sugar moto which starch (a most abundant ingrexicent

200
in most kinds of vegetable food) is converted by the saliva, and pancreatic and intestinal juices, before it is fitted for absorption or any further changes. Since the sugars (which may thus be regarded as including stareh) do not, in the normal condition, pass into the excretions, lut are oxidised in the blood into carbonic acid and water, as ultimate products, they must contribute materially to the support of the animal heat. But they have other uses which we shall endeavour to explaim, and which will, we trust, be intelligible if this article is read in conjunction witl that on Digestion, to which we have already referred. Before becoming oxidised into their tinal products, they undergo varions phases of less perfect oxidation, in which lactic, acetic, bntyric, and other acids are evolved, of which the most important and abundant is lactic acid, which is fomed in considerable quantity in the small intestine, where it is doubtless of service in contribnting to dissolve any nitrogenous matters which have escaped the action of the gastric-juice. Another use of these acids which are developed from the sugars is, that by acidifying the albuminons intestinal contents, they greatly increase their diffusibility throngh the intestinal membranes into the lacteals, and probably the capillaries. Here we probably have the clne to the therapentic use of acids in various disorders of the chylopoietic viscera. Under certain conditions, the sngars are also converted into fat in the body.*

The remaining carbo-hydrates are of little or no valne as food. There has been much difference of opinion as to whether gum can be taken up and applied to any definite uses in the organism; but the great mass of the most trustworthy observations seem to shew that it passes through the system unchanged. Independently of experiments on animals by Boussingault, Lehmann, and others, Dr Flammond (an American chemist and physician) found from experiments upon himself (1) that gum is altogether incapable of assimilation, and therefore possesses no calorifacient or nntritive power whatever, but is, on the contrary, a source of irritation to the digestive or gaus ; and (v) that in consequence of the above fact, the solids of the urine during a purely gum-and-water diet are entirely derived from the waste of the tissues of the body, while the carbou exhaled (as carlonic acid) from the lungs is derived from the consumption of the fat.

Cellulose, or the substance of the regetable cell, resists the action of the digestive fluids, and reaphears unchanged in the fieces.

Vinecrar is probably only of use indirectly in softening mimal textures whieh are taken as food.
3. 'lhe oleuginous group inchades all the fats and oils, whether delived from the animal or the vegetable kingdom. The memhers of this extensive group are composed of carhon (ranging from 60 to SO por cent.) aur hydrogen, with a little oxygen. Fat which has been taken with the food is manly absortiorl by the lacteads, althongl a portion of it passes directly intr the capillaries of the villi, as hats lwen sluwn by micruseopic examination, which has revealed the presence of fat-manules amongst the himod corpuseles. The moditications which aro improssml unen the fats, in orilev to prepare them for ahsmedin, are explained in the article Ingestion. Their nses in the system are various. In their oxidation in tha wrumism, whether the process bo gratual or rapit, at lage amonnt of heat is liberated;

That risparches of Foussingant on milch-cows, of Milm Elwards and others on bees, and of LacazeIbuthicrs on the insucts inhabiting galls, distinctly shew that stareh and sugar are capatio of being converted into fat in the anmal organism.

## DIET.

and that they are oxidised, and for the most part ultimately resolved into carbonie acid and water, is evident, because they neither alyear in any 'fuantity in the excretions nor aceumalate lreyond a cortain point in the organism. Noreover, in artilicial, and doubthess in matural digestion, the presence of it little fint accelerates the solution of nitrogenous matters taken as food. Lastly, tho oceurrence of fat in milk, in the eger, in all pastic exurations, aud in all highly cellular organs, is a clear indication that this sulstance plays an inportant part in the process of cell.formation; hence we may probalily explain the therapentie use of such modiciups as cod-liver onl.
4. I'he albuminous group contains all those sulsstances which are chemically known as the proteinebodies (sce l'roteine), viz., albumen, tibrine, caseine, and tho allied vegetahle compounds, all of which are composed of very nearly the same proportions of carbon, hydrogen, nitrogen, and oxygen; while additionally they contain a little sulphur or phos. phorus, or both : they all contain on an average about 15 per cent. of nitrogen, a substance which has not oceurred in the preceding groups. All these proteine-bodies, such as occur in the fluids of the erg, in animal flesh, in the curdy matter of milk, \&e., are dissolved by the gastric-juice and intestinal finid, and converted into matters termed peptones, which although similar in their ultimate composition to the substances from which they are clerived, differ from them in their greater solubility and their more ready dillusibility through animal membranes. Like the fats, they are chietly absorbed by the lacteals, but to some extent by the capillaries. A reference to the chemical composition of the milk and of the tluids of the egg, shews that all the nitrogenons tissues in the body of the young animal must have been primarily derived from alhumen or caseine; and it is established beyond all loubt, that these sub. stances are throughout life the essential producers of blood, and consequently of the various nitrogenous structures which are built up from that tluid.
5. The gelatinous group (which fommel a part of Prout's albuminous gronp) includes the different varieties of gluten, obtained by boiling, from many animal tissues; as, for example, bone-eartilage, tendons, skin, hoofs, \&c. All soups and jellies which stiffen on coobing contain it, and such substances are popularly, but erroneously, regarded as hindly nourishing. Unlike the preceding group, from which they only slightly differ in ultimate eomposition, they do not appear to form new bloon, and thei uses are still so questionable, that we will merely notice one function of them, which bas been suggested hy Liebig-viz., that these substances may go directly to the formation of such tissues as yield gluten on boiling, and which, if this food were not taken, would have to derive their nourishment from the members of the preeeding group.
6. The saline group. With the exception of eommon salt (chloride of sodium), which we take instinctirely in additional quantity with most linds of food, the members of this group are meonseiously taken in the different articles of solid and fluid food on which we live. Want of space prevents us from notieing the ditlerent foods which yield the individual salts; but when we invariably find phosphate and carbonate of lime in the bones, in tixed and definite proportions; when we invariably tind a nearly fixed proportion of chloride of sodium, alkaline phosphates, and other soluhle salts, in the blood, flesh, milk, \&e.; and when, further, we find that these substances are being constantly eliminated by the urine, it is obvious that they must be replaced by the food, if we would keep the organism in its normal state. The evil consequences of a deficiency
of any of those ingredients of foml are woll known; thus, when too hatte phosphate of lime (to which bone owes its firmmess and harlucss) is tibken into the system, or whon too much is arrain taken ont (as oceasionally, during fromanoy, when the fortal loones requir: it for therr essification), fractures do not readily muite.

It is only conpanavely reenatly-shuing the last quarter of a century-that phywiongists have satisfied themsolvon, that in order to silply the wants of the sygtorn, fome must consiet of a rombination of those groupus : and that anmals whish are fed exelusively on food buloncriag to one of thr groupgas, for wample, albumen or fibrin-prith mater symptoms of inanition, as certainly as if they hat bero deprived of all nourishment. As in the infant's milk we lind the albuminous, oleatinous, saccharine, and saline proms represented by the casen ${ }^{\text {a }}$, butter, sugar, and salts. su, for other periuds of life, the food, whetlier derived from the animal or vegetable kingdom, must contain a due (althougb not necessarily the same) proportion of the different types. Agatin, in judging of the nutritive value of any kime of food, we must take into consideration its digestihility. Thus, the experiments made by br beammont on Alexis St Martin, a Canarlian, in whom there was, im consequence of a gun-shot womarl, a fistulous opening leading from the exterior to the interior of the stomach, and recent experiments made by Busch on a woman with a fistulous opening into the jejunum (see Allmesicary Uanal), shew, for exmmile, that hard-boiled egrs, meat that has been boiled for a long time, and hard eheese, which is poor in fat, are less easily and rapidly digested than soft-boiled or fresh egrs, meat steeped in vinerar, or moist, fat cheese, and that starch is much more reatily conrerted into sugar when boiled than in the raw form.

As the nitrogenous constituents of the food (artieles containiug albumen, fibrim, \&c.) are chiefly employed in the formation of the blood and the reproduction of the tissues, it was at one tine thought that the quantity of nitrogen which any kind of fool contained might be taken as a measure of it.s untritive value; but this test is not altogether to he relied on, since the nitrogen in part depends upon the gluten-yielding matters, which probably contribute little or nothing to the formation of textures.

Buth daily experience and chemieo-physiological observations shew us, that the best kinds of food contain looth fat and carbo-hyduates, in addition to albuminous matters. Instinct teaches us to combine highly amylaceous fools with fats; as, for example, bread and lutter, beans and fat bacon; and the increased digestibility of such mixtures proves, no less than the simultaneous oceurrence of fat aml sugar in the milk and in the egg-tluids, that lonth substances are nectssary, as independent ingredients of foorl, althongh, perhaps, one may temporarily serve as a substatute for the other. Unfortunately, we have no trustworthy data for enabling us to determine the proportion in which the different nutrient groups should be combined, so as to form the food best swited to the general wants of the organism. The proportions occurriop in human milk are the following: 10 parts of plastic or bloodforming matter (casemet), 10 parts of fat (butter). 20 parts of a carbo-hydrate (sugar), and 116 of a piat of salts. For the wauts of adult life, a lesser ratio of phastic matter (albumen, \&e.) would wobably sutine.
"The absulnte quantity" of food reguired for the maintensnce of the hman hody in health varies so much with the age, sex, and habits of the individual, aul with the circumstances in which be may be placel, that it is impossible to fix a standard

## DIET.

applicable to every case; lut from the consumption of foom ly large hoides of healthy men, such is our soldiers and sailors, we can retermine with tolerathle accuracy the crescop daily gumatity. We extract the following remarks from Tohl and Jowman's I'hysiologicul Aurtomy und Physiology of Man. 'Eachseaman in the Pritish uaval service is allowed from 31 to $3-\frac{1}{2}$ onnoes of dry mutritions fool daily, of which of ounces are vegetable, and the rest anmal ; the latter consisting of 9 omees of salt meat, of $4 \frac{1}{2}$ of fresh. Sugar and cocoa are also given, The suldier is allowed in pond of lowal, and threey parters of a poum of meat. In most of the Landon huspunis, full diet, which is given to convalescent patients who need a liberal dict, consists generally of half a pound of meat, with from 10 to It oumers of 1mead. half a pound of potatoes, a pint of milk, and sometimes beer or porter-a pint of the former, or half a pint of the latter. The formes dietary is destine for faen who must he in realiness for the most active athletic excreises. requiring not ouly great mnsenlar strength, but also cumsiterable power of enduring fatinue. The latter is intendel to reeruit the powers of those who have been suffering from disease. 1f, now, we compare with these a dietary Which las luen found sufficient for the suphart if health in a state of more or less confinement, with a monerate amount of daily labour, we may fairly infor that the prow allowance for prems not (ongaged in actual mamal lahomr lies between these extremes. In the union workhonses of Enoland, able-botied men ohtain almont ounces of solit ford daily, of which the quantity of meat does not exeeed $\overline{5}$ or 6 conces. In prisons, it has been fomm neces. sary to give a certain anome of anmal fore to prisoners who are subject to harl labour. Each of such ${ }^{\text {risoners, }}$ if confined for a term exceeding three months, ame kept at hare latuons. las a daily allowane of abrut 36 ouners of foul, of which meat constitutes only a very small portion-namely, ahont 16 monees in the weela. The prisoner has olivionsly the advantage of the poom man, whose only crime is fuwerty; "inut there is mouhtless sufficient justification for this in the fact, that the lathon of the prisumer, ame the mental depression which lonscontimend restraint and confinemont induce, rember a greater anmant of mutriment necessary than the indigent would require, who sock in the workhouse a shelter from ahsolnte wat.' Pro further metails on this snloject, which is me of great practical importance, we may refer to a daner hy lir lyon Playfair, 'On the Fonl of Han mane Differnt Combitions of Age aml limplovment, publishonl in 155t, in the Soth valume of the Edinharth Fom Mhilosophicel forrnal, and to a momair by br E , Smith upon 'l'risom and other butariss,' in the Transartiom of the soristy fion the Promation of socient secimer, lsos.

It arpeats, then, that a daily ammant of fomi,
 tain hoalth: amel of this a fourth or fifth part ought tor be animal fund: but in special cases, much mone of much less may low takon withont apment injury. The suallent dinatity of foral upen whichs life is known tu have been supported with haolth and stamentho is that on whinh comaro-whose history is wemeded in most lumks on Wat and Dintetiesstates that has andsisted, in morer to reance extreme
 12 mumes of fowl, chinetly vegretible, with 14 ounces of light wim. In matrast with Cornarn's case, We ury rofor to instunes reconded ly larry and wher aretio maners of the voracity of the natises of tha.." mole regions. A yomes lispmiman, who was allowed 'mblmitel diet, avalled himself of

hours, 35 lbs. of various kinds of fool, including tallow-candles; and the Cossacks of siheria are repred to consume daily from 12 to 20 lbs. of amimal fom.

An article nou lict would he imperfect withont a refurace to the lest monle of ilressing meat, for cookery aud digestibility are closely allied. Most persons fint meat that has leen broiled most easily digested. The fire should he brisk, so that the albumen on the surface of the meat may be coagulated rapidly, aud thas retain the internal juices. A similar rule applies, for the same reason, to hoiling and roasting. When meat is to be boilet, it should be phuaged into water alrearly boiling; while, if soup is to le made, the meat slomh be put iuto cold water, and the temperature slowly anl gradnally raised-the object, in the former case, being to yetain. in the latter, to extract, the mutritions fluils. (ree Bolang and Beorlivg.) Fried meat and rich stews are usually very iudigestible. Salted meat is nat only harler ani more indigestible than fresh meat, but the process of saltiug extracts important salts, and much of the mutriont jnice from the meat; the only execption being fut pork, which is rendered more digestibl liy salting. On this suljeet, see Lielig's lirsetrchen on Food, 1S47.

We shall conelude with a notice of certain substances which, althomg they are hardly entitled to be termed fools. muy furly the considered, from the miversality of their use, to exert a definite influence on the orcanism, and to shpply certain existing, although, perhaps, undefined wants. We refer to alenhol, tataceo, tea, and coffee.

From three series of olservations made upon himsclf. Dr JIamond arrives at the conchusion, that alcohol increases the weinht of the burly, lyy retarding the metamorposis of the ohn and promoting the formation of new tissues, and limiting the consumption of fat.' The respiratory anil minary excretious, and the faces, were invarially diminishoul. These effeets occurring when thie amount of fool was blow the quantity required to maintain the weight of the body, were protuctive of 10 ondeterions result to the system; but when the fool was sulficient to balance the waste from the excretions, and still more, when an excess of aliment wer the demands of the system was ingested, the health was disturbed, and disease admost induced. Dlence the habouring man, who can harily fiml hread and meat enough to preserve the balace betwen the formation and decay of his tissues, fimls in alcuhol an agent which, if tiaken in mulemation, chaldes lim, without distmbing his health, to dispense with a certain quantity of ford, amel yet keepls up the weight and strength of his honl: " "n the ither hant, he whe nises alcolnol When his foon is more than suflicient to suphy the waste of tissuc. amb, at the same time, dones not increase the ammat of his fhysieal excreise, or driuk :us : whlitional unantity of wator (hy which (the decely of tissue wonld tee acerleratod), retards the metamondasis, while an ineromsed amone nf motriment is lemg assimilatod, and thos adds to the phethare comblion of the system which exeessive fored has a tembery th monluce.

Tonseces anemeting to the experiments of the sann excellent observer. rescmbles alcolan in thess respects, that when the tom is sumicient to preserve the weight of dan buty, it inereases that weight; and whon the form is isnt sufficient, and the body, in consmumere, luses weight, it restrains that loss: thot it diffors from ahomof in heing mattended with any muleasant eifinets upon the cirentation, thongh its artinn on the han is ipparent in increased norvas excitemon, followed ly a plasat fecting of ease and contentment. la these expriments,

Dr．Ifammone，who was bot in the habit of using

Tea and coflet are nstally holiowd to have a somewhat similar effect to that which，as we latre
 power of teri in arresting the whetr of tissues has， however，recontly buen calliol in pucation by for lidward suith in at memoir＇On the＇homical and

## DIFFERENCE-DIFFRACTION.

## DIFFERENCE : DIFFERENCES ; CAL-

 CULUS OF FINITE DIFFERENCES. The worl difference means usually the excess of one quantity over another of the same kind, and this is its meaning in arithmetie. In the higher branches of mathematies, however, it has a peculiar meaninc, which we shall briefly explain. When we have a series of numbers connected by a regular, thomb not olvious law, the character of that law may be detected by forming a new series of the differaces between each term of the original series and the next, and then treating the new series (which we may call the series of 'first differences') in the same way; and so on, till we reach a series of differences the law of which is manifest. Thus,|  |  |
| :---: | :---: |
|  |  |
|  |  |
|  |  |

The law of the series of third differences is manifest; we sue that its next term must be 7 , which gives 28 as the next term of the series of secoml differences, 87 as the next of the tirst differences, and so $23 S$ for that of the original series, which we can thas continue to any number of terms. To take a simpler case. Let the series be

> First differences, $\quad . \quad . \quad . \quad 4,{ }_{2}, 6,2,,_{2}^{43,} 10^{61}$ Scond differences,

Here the law is manifest in the first differences, and we should be able to calculate the scries if we knew the first terms of the three series; viz. $43,4,2$. It is on this principle that calculating machines (q. v.) can be constructed to compute tables of lugarithms, \&e. Ont of the method of Differences sprngg the Calculns of Finite Differences, first treated by Dr Brook Taylor, under the name of the Method of lncrements. This calculus has mothing to do with the Transcendental Analysis. See Calceles Differential, \&c. It deals with the changes of functions when definite increments are made to the variables; while the Transcendental Analysis considers only their changes when indefinitely small or infinitesimal additions are made to the variables. It would le ont of place lrere to attempt an account of the Calculus of Finite Differences. See Functions.

DIFFERENCES, in ILerakly, though often, or indeed generally, confounded with marks of Caleney (q. v.), have, in strict usage, a totally different function-the former being employed to distinguish brothers and their descendants after the death of the father, the latter whilst he is still alive. Differences in this limited sense may consist either of a chief added to or a bordme placed round the plain shich borne by the beal of the house; or shonhl the shield exhibit any of the Ordinaries (y. y.), as the bend, fess, 1 sale, \&e., the difference may he indieater by an alteration on the lines. The proximity of the bearer to the hand of the house is indicated by the character of the line ly which the differencing chicf, or bordure, or orlinary is mankel off from the field, the following being the orler usually olserved: the tirst or eldest brother, on the death of his father, inherits the pure arms of the house; the scemil brother, if the difference is to consist of a bordure, arries it plain; the third, ingrailed; the fourth, inveterl; the fith, embattlet; \&e. Other morles of differencing have been insented by heralds, and are not manown to practice; such, for example, als chaming the tinctares either of the field or of the principat figures, of which Nisbet gives many fammos examples-altering the position or number of the figures un the shichl, alding different fignres from the mothers coat or from lands, and the like. Where the culet is far removed from the principal
family, if the field be of one tincture, it is sometimes divided into two, the charge or charges being counter-charged, so that metal may not lic ou metal, or colour on colour. The confusion between differences and marks of carlency, above referred to, is by no means peculiar to the heraldic usage of England, though there it is more prevalent than in Scotland. In France, the cadets of the IIonse of Bourbon have been in the habit of contimuing these marks, and at the present day, as in Mackenzie's time, the labol or lambel is to be seen on the arms of all the nembers of the Orleans family. That no distine. tinn between what we call marks of cadeney and differences was there observel, is further apparent from the fact that, whilst such was the practice of the House of Orleans, the House of Anjou earried a bordure gules, and that of Alençon a bordure gules charged with eight bezantes. In Germany, Sir George Mackenzie says that the several branches of great families distinguish themselves only by different crests (Precedency-Works, ii. 616); and he gives as the reason, that all the sons succeed equally to the honours of the family: In Britain, and in Erance, some change is always made on the shield as carried by the head of the house; but the practice even of good heraleds has been so irregular, as to bring the rule very nearly to what Mackenzie bolds to be the eorrect one-viz, that every private person should be allowed, with the sanction of the proper anthorities, 'to make what marks of distinction can suit best with the coat which his chief bears.'
Differences, Calceles or. See Difference.
Differe'ntial caluUlus. See Cillulus.
DIFFERENTIAL THERMOMETER. Sce Thermometef.
DIFFILACTION, or INFLECTION, of the rays of light. It was olserved by Grimaldi, that if a beam of the sum's light be let into a dark room throngh a rery small bole, the shadows of things in this hight will be larger than they ought to be if the rays passed ly the hodies in straight lines, and that these sladows have tlace parallel fringes, bamds, ur ranks of colowed light adjacent to them.
This phenomenen was originally known unler the name of diffraction, and was supposel to arise from the refraction of the atmosphere. This explanation was disproved by the observations of Newton, who, from the conception which he was led to form of it, ealled the phenomenm the 'inflection of the rays of light.' It is now ilentified with a larger class of phenomona, which have been much more eompletely explainec in the later decelopment of the theory of light, and are assigned, on the bypotheses of Fresuel, to the interference of umdulations. Sce latrimerevee. The observations and experiments of Newton un the subject, ats detailed in the third book of his work on Optics, are, lwwever, extremely: interesting amb instructive, and with regard to accurate observation and deseription, apart from the imperfect state of the theory, leave nothing to Ie desiteri.
Having manle in a prece of hat at small hole with a pin, whese brathth was the del part of an inch, Newton lat into the Jarkencl chamber a bean of tho sur's light. In this light, the shatows of all butie's were borderm with thee parallel fringes or bands of colonired light. The shamber of a hair,
 itself, ani fringes of light were olserved within it.

Avain abinittins light into the darkened apartmut lis a bole a guarter of an inch wite, he allowed it to prass between two knife-edges parallel

## DIFFRACTION.

to one another. In this case, owing to the breadth of the hole by which the light was anmitted, the fringes did not appear within the shadows of the knives mitil the kuifeedges were lrought to approach one another, when they appeared. By waking the hole smaller through which the light was almitted, they becane more distinct. 'As the lanifo-edges contimally approached one another, the frimges grew distineter and larger, until they vanished. The outmosi fringe vanished tirst, aud the milillemost next, and the immermost liast; and after they were all vanishel, and the line of light which was in the middle between them was grow very broal, is shanow began to appear in the minitle of this line, and divide it along the midde into two lines of hight, and increased until the whole light vanished. This milargement of the friuges was so great, that tbe rays which go to the innermest frimge seemed to be bent above twenty times more when this frimge was ready to vanish, than when one of the knives was taken away.'

The order of these phenomena is then manle elear by the following experinent: 'I caused the elges of two laives to be ground truly straight, incl pricking their points into a board, so that their edges might look towards one anuther, and meetin! near their points, contain a rectilineal angle, I fastened their handles together with pitch, to make this angle invarialle. The distance of the edges of the knives from one another at the distance of four inches from the angular point, where the edges of the knives met, was the eighth of in meh; and therefore the angle contained by the edges was about $1^{\circ} 54^{\prime}$. The knives thus fixed together 1 placel in a beam of the suu's light, let into my darkened chamber through a bole the $42 l^{2}$ part of an inch wide, at the distance of 10 or 15 fuct from the bole.' When the fringes of the sharlows of the knives fell perpemdicularly upon a paper at a great distance from the knives, they were in the form of hyperbolas, and are represented in the following figure.
In the diagram, CA, CD, are lines drawn upon the paper paralled to the edges of the knives, and between which all the light would fall, if it passed between the edges of the knives without inflection. The lines $e i s, f h t$, and $q l v$, represent the terminus of the shadow of one of the knives, the dark line between the first and second fringes of that shadow, and the dark line between the second and third fringes of the same shadow. The lines $x i p, y / k q$, and alr, represent the same lines corresponding to the other knife-edge. These himes are hyperbolas, having for asymptotes the liue DE, and lines parallel to CA, Cl3, respectively.

It will be seen that in this experiment the fringes

Fig. 1.
become wider towards the narrow end of the opening, just as in the former case they beeame wider as the knife-edges approached one another.

The best mote for exhibiting the phenomena of diffraction, and that now generally adopted for that
purpose, is as fullows: 'the rays of sunlight leeing reflected honzontally through an anerture into a darkencol apartment, are concentrated by a combination of lemses to a very small forns. Jey this means the light is mate to dherge from a very small circle, with the adyantage of a greater concentration of lifht than is obtaned hy simply ahitting the sunlight throngh a swall aperture. The edges of the shadows of every object placel witnin the cone of light diverging from this focias, will cexhibit the fringes above deseribed.

By means of metal-kaf arringed upen a phate of glass, as in the aceomanying diadram (fig. 2),

Fig. $\stackrel{n}{2}$
shudows can now be thrown upon a screen, so as to exhibit at once all the most peculiar phonomena of this chass.
The figures $b, c$, in the acompanying diagram (figs : $:$ and 4), represent the apquarance presented

Fig.

Fis. 4.
by the shadow of a wire and of a small circmar disc.

The following is a popular explanation of the phenomenon above deseribed as now understood. Supposing light to be Iropagated by undulations proceeding from a single small source or focus at $\Lambda$ (ig. 5) : let $\mathrm{B} b$ be a section of the front of a wave of this light, that is, a section of a surface massing through all the particles which are at the same mintant in the same phase of vibration. Let Cer represent the front of the same wave, when it has passed through the additional space FC: The vibrationg of the prerticles in $\mathbf{C} c$ are the consequence of the vibrations previonsly existing along the space $\mathrm{B} b$. But then, the motion of the partiele at C is determined not alone by the frevious motion of the proint li, immediately opposite to it, lint is affected more or kess by the motions of every $l^{\text {wint }}$ in the surface $\mathrm{B} b$. If, therefore, the vibrations wer a portion of the space $\mathrm{B} b$, be intereepted by a dark object de, placed there.

## DTFFRACTION-DIFFUSION

the circumstances which determine the motion of the point ${ }^{\prime \prime}$, may be totally changed; and taking into account the umited effect of these sibrations, it may be found that the result, instead of light, will be darkness. Again, if a point of be taken directly behimd the dark bouly ch, although the
Fig. 5. vibrations over the space ele. which woukl otherwise affert it, are stoppest, it may still be affected by the viluations in the remainder of the surface $\mathbf{B} /$; and if the combinen effects of these be such as to canse in it a suthicient vibration, there will be light at the point $f$, thongh it is moperly within the shanlow of od. It is inpossible here to go further into detail, and it can ualy lie said that, on the assumption of Fresncl, the explanation of the whole phemonena above described is most complete and satisfactory, the frimes and dark lines being prorluced by the umbulations alternately strengthemines or destroy ins each other. A very leantiful experiment, levised by Fresnel for the pmonose, is foum to furnish a complete verification of the theory. see 1 NTERFEIREXCE.
D) $\mathrm{FF}[\mathrm{S}$ ONO then gramal dispersion of particles of une liquid or sas among those of another-or of the praticles of a solich in a ligrid hobling it in solution. It is of the insatest injortance in terrestrin] physies, being the canse of the uniform composition of the atmospluere at all elevations, and ome of the canses of tho speedy dissipation of noxions grases and vapours in the men air, and of the nearly uniform salthess of the seat, we., so necessary to animal and vegetable life.

We shall cousider the alure cases in detail, and in aldition the transfusion, as it has heen colled, which oevors when ditierent gases or liquins are sen mated fom vach other by a porous plate or mombrane. Tha principal expeciments on this sulijeet are those of Graham and Bunsen-to ber fomme in the Philowephect Tronsentione or Graham's '\% mistry, ank in Bhasen"s f"pommetry.

1. Difiturion of trenses. If two thasks be fillerl, nne with hydrogen, the other with chlorine, atme consected by a long tube fitted into thedr neeks liy corlss-in whatever position the compenmul apparatis be pacerl it will be foumd that the gases mutnally interpenetrate-in this prartienlar case the colno of the chlorime enables us to follow ly the reye the compe of the diffusion. When the misture has attained its, fermanent state, each of the gases is fomen to fo unifomly diftused throush the whole containims spate, procisely as it woilid have leon lad thi.  USt;
so that its tension shall have a eertain value depending on the temprature alone. If air la present in any quantity whatever, the vaporisation will jro ceed more slowly, but the final amount eonverted into vapour will be the same as in the former case. A familiar illustration of this is afforded by the dew-point, which is a temperature merely, luavines no connection with the leight of the barometer.

Next let us take the case of a gas forced by difference of pressures from one vessel to another through a very small hole in a thin metallic plateone of the resscls, for instance, being full of the gas, and the other connected with an air-pump kept continually in action. Experiment, and theory such as it is, anree in giving in this case, for the velocity witl which the different gases fass through the orifice, umder similar circunstances as to pressure. a result inversely proportional to the square root of the density of cach gas. Now, if, instead of the ]late with the small hole, we substitute a thin layer of bamblex or other membrane, or a thin dise of plaster of Taris, it appears frome experiment that the results are sensibly the same. Thus, if we have the same ras at elifforent pressures on opposite sides of such a layer or dise, the rate of 1 rassage of the gas throurl it, from greater to less pressime, will, for the same pressnres, hut lifferent gases, vary according to the above law; and, moreover, the presence of a second gas will in no degree modify the rate of transfusion of the first. If, therefore, a glass tube, say in inch in diameter, and two or thee feet long, have a diaphragm of blaster of Paris formed wear une end, and that end groumd that, so as to be perfectly closed ly a glass llate, it may be filled with hydrogen bey displacement, its other and lower extremity being plunged into water, and care being taken nut to wet the diaphragm. If the glass plate be now removal, transfusion will take place -hydrogen passing out as if into a vacumm, and the constituent gases of air entering also as if into a racomm. On account of the comparative lightness of liydruren, the velocity with which it escapes will be consilerably greater than that with which the others enter: so that the immediate effect will be a rise of the wator in the tube. After a short time, the whole of the hydrosen escapes, and the tulse will eontain only ari. The proportion of the volume of the latter to that of the bydrogen may In calcolater from the alose law-remembering that the hydrogen is mactioally diffusing into a vacum all along, and the air entering by the pressure of the atmonimere in excess over that of the air in the tule. Allowing for the mavoidable errors if aleriment, the veritications of these results sure very satisfiutory, It has bern attempted to dealace these laws as ronsequences of the dynamical theror of gases. Su a remarkable pater by Jaxwell in tho I'hilosophicul. Morfazine for 1860.

Romsen las sumested the apmication of the methorl of dillusion lo dhe rery important ruestion in gis annlysis-whetlue the constituents of a gas, as Thetrmined ley the usual methods, are merely mired, we are chemically mated. ## DIGEST-DIGESTION.

Descartes, After Charles I. had fallen. D. returned t. England, but the parliament forbade him the linglom, under penalty of death. Retiring to the contineat, be travelled in France and Italy ; but in 1655, he was again in England, and was in frequent attendance at the court of the Protector. He went again to France, and busied himself with the preparation of philosophical papers. He returned to England in 1661, and died there in 1665. D. married a danghter of Sir Edward Stanley of Tongue Castle, in Shropshire, by whom be had one son.

His works are numerous, and on a great variety of subjects, comprising i Conference with a Lady thout the Choice of a Religion (Yar. 1638), Observatrons on Spenser's Fairy ?ueen (Lond 1644), A Treatise on the Soul, miriny its Immortality (Par. 1044), Of the Cure of Womuls by the Powder of Sympatly (Lond. 16.5 ), and Discourse on J'egetation (Lond. 1661, \&c.). The Private Ifpmoirs of Sir h.' Dighy, \&c., written by Mimself, were published in London in 1827. D.'s library, which was removed to France when the Corvl War broke cuit in Enclanel, became, on his death, the property oi the French king.

DIGEST, a name often given to the Pandects (q. r.) of the civil or Fiman law, because they contained 'Legalia precepta excellenter digesta.'

DIGESTER, PAPIN's, is astrong boiler with a closely fitting cover, in which articles of food may be boiled at a higher temperature than 212 F . is its name implies, it was invented by Papin, and a common form is the Autocluce, fig. I, where the lid can be turned round under clamis or ears, and thas be rendered steam-tight. Another form is given in fig. 2 , where a prortion of the sine is renoved, to

Parin': Digestar.
exhint the interior. The lid $A$ is fastemod down l'y a screve P , and the steam generated in the lower is allowed to eseape at a stop-cock C , or ly raising the watithed valve I. The increased pressure to Which the contents of the loiler are exposel, canses the boilinepoint of the water to rise to $400^{\circ} \mathrm{l}$, ami necasionally highur. The digester is of great value as at mans of [repringemper of various kinds, and rspechally in the extraction of gelatime from bones.

Doderston, Orgass ase l'mocres of. The fruction we proerss of liyestion is one of the ehief of those urganic functions which are directly concerned in maintaininer the life of the indivilual, inasmuch as it is that thronch which the animal is enabled to receive alment, and to prepare or modify it for lemon assinilator the and appopriated by, the varimas oreans of the hady, or, in other words, for beine converted into blowl.
The enmeral 'xpression, 'function of digestion,' inclules someral minor or subordinate processes.

According to Milne Edwards, the acts of the digestive function may le classed as follows: 1 . There is the Prehension of the Fool; 2. Its Mastication; 3. Its Insalivation ; 4. Its Derintition; 5. Its Chymification or Stomachal Digestion; 6. Its Chylitication or Intestinal Digestion; 7. Defrecation; and 8. The Absorgtion of the Chyle.

Before examining these acts in succession, and the mechanism ly which each is effected, we must have clear concepitions regarling the classification of food, the quantity of foud, and ather allied subjects, which are discussed in the article Diet; and we should likewise have some knowledge of the causes of those sensations which we call hunger and thirst, which are, or ousht to be, our natural guides regarding the periods for taking food, and the quantity to be taken. The inmediate cause of ordinary hunger cannot lie explained; but that it is due to some peculiar condition of the gastric mucous membrane, seems proballe from the fact, that the scnsation continues after division of the pneumogastric nerves, from which the stonach mamly derives its nervous fibres, if we correctly interpret the feclings of the animals on which the experiments were made. In extreme hunger, the sufferer complains of a sense of sinking, which is referred to the region of the stomach, while general faintness and sometimes considerable pain are present. Honger, or the want of fool which occasions it, may be diminished by rest, sleep, or any cause that retards the general change which is perpetually going on in all the tissucs of the hody. We have shewn in the article Diet, that tolnceo and alcolol have as power of limiting the disintegration of the tissues, and thus of keeping off or diminishing longer. When the sensations of extreme hunger are not relieved by food, the hody begins to feed upon its own tissues, and the symptoms of Starvation (q. Y .) begin to manifest themselves. The period at which death occurs from abstinence, varies greatly in different animals-young animals always dying sooner than older ones. In man, total privation of food usually causes death in about a week; but if a little drink be allowed, life is considerably rolonged.

Thirst is dependent upon a peculiar condition (probably undue dryness) of the macons membrane if the upper part of the digestive tube. The thirst in febrile affections is, however, probably due to the morbid state of the blood.

We now proceed to the consideration of the different rets of which the digestive function is made up.

1. In the act of prehension, manand many of the lower animals (monkeys, squirrels, \&c.) employ the hands or anterior extremities and month; the hifs aul anterior tecth, and, to a certain extent, the tongle, being also employed in this function. In the lower animals, however, the modes of prehension are varions. Some (like the girafle) twist the tongue around the leaves and young loranches of trees; others (the ant-eaters) have a remarkably long tongue, covered with a viscin secretion, and by thrusting this organ into ant-bills, \&e., secure their prey ; and in the chancleon among reptiles, and the wooducekr among birds, the tongue seems sperially fievolopel for prehensile purposes. In the dephant, this act is acomplished by the prolongation of the mostrifs into the organ popularly known as the trunk. In wher mammals (the Raminants and Bolipeds), the large pendulous lips are the argans cmployed. In hirds, the bill (which is a momlitiention of the lips) is always the prehensile uryan of that closs.

The prohension of flaids is effected in tro ways: sumetimes the lignial is prourcd into the month, and
is allowed to fall into it ly its own weight; in other eases, tho tongue is used after the fashion of a piston, leing drawn within the month so as to exhanst the interior part of that cavity, and thuids are thus forced to enter ly atmospheric pressure.
2. Mastication is eflected in the cavity of the mouth by means of the teeth. 'I'luis ravity is bounded superiorly by the palate or roof of the month, and in other directions hy the checks, lijes, and tongue. l'rojecting into its interior, ahave and helow, is an arched series of teeth, which are timbly fixed by roots into corresponding sockets in the upper and lower jawbones. The upper jaw (and consequently the dental arch imbedded in it) is immovable, or only movalle with the entire head; but the lower jaw, with its teeth, is capable of moving upwards, downwaris, lonckwards, forwards, and laterally, by means of the powerful muscles of mastication. It is by the varied movements of the lower teeth against the apper, through the action of these muscles, that the food is broken down or masticated. For information regarding the structure, \&c., of the teeth, see Teetri ; see also Dentition.

The operation of mastication is rery important, since the more the food is broken down the more easily will it mix with the sativa and other fluids which participate in the digestive process.
3. Insalivation is effected liy the admixture of the secrotions of the three pairs of salivary glands (the parotids, the submaxillaries, and the sublinguals) and of the buccal mucus with the triturated food. A brief description of these structures is given ia the article Gland. The common saliva, formed by the combined secretion of these various secreting orgaus, is a colourless, turbid, viseit, inodorons, and tasteless fluid, which, after standing for some time, deposits a layer of pavement epithelim (see Epithelium) and mions corpuscles. In the normal state, its reaction is alkaline, lnut the degree of alkalinity varies, and is greatest during and after meals. Saliva does not contaln more than tive or six larts of solid constituents to !95 or 994 parts of water, the most important ingredients leing an organic matter termed ptyaline, and sulphocyanide of potassium, neither of which sulhstances oceurs in any other solid or fluid of the looly, The daily quantity of saliva secreted by an adult man is estimated at ahout $4 S$ ounces, hit determinations of this kind must be regarded only as approximations to the truth, since the activity of the salivary glands is dependent upon various influences and conditions. Thus movement of the lower jaw, as in masticating, speaking, or singing, increases the secretion ; as also do acrid and aromatic substances. and dry hard food; while the use of moist aml suft food is accompanied by a scanty secretion.

The uses of the saliva in reference to digestion are partly mechanical and partly chemical. The mechanical nses are almost too apparent to require notice. The moistening of the dry food by the saliva serves the double purpose of adanting it for deglutition and of separating the particles, and thus allowing them to be mere freely acted on by the other digestive fluids; moreover, from its viscidity, it lubricates the bolus of food, and thus facilitates deglutition; and it is probalily also subservient to the sense of taste. The great chemical use of the saliva is to couvert the amylaceous (or starchy) portion of the food into glyeose or grape sugar. and thus to promote its absorption.
4. Deglutition is the act by which the fool is trans. ferred from the month to the stomach. The pharyns, or carity into which the month luads, takes so slight a part in the digestive process, that we need searcely allude to any anatomical details connected with it.

It is sufficient to olserve that between it and the month is the pridnlous or soft palate, which is a movable muscular partition that sejarates the two cavities rhrmp mastimam. As som, however, as the latter act is accomplishad, whe the bohs is pressed lackwards ly the tongu4, the soft palate is drawn 1]pwards and backwitrds, so as to permit the pass:uge of the ford into the fllarynx. The bolus or pellet of foot havine arrived mat the esophaghes or gnllet (which is continums inferiorly and jwstariorly with the pharynx), is driven inta it hy the action of certain muscles, which almest surmond the pharynx, and are ternem its constrictor muselas. All whinntary action reases as snon as the fond is pressed hackwards hy the tongue into the pharynx. It is impossible to recall the pellet, and it is necessarily carrive on (withont even our cognizance) into the stomach. On receiving the food forcen inte, its uprer extremity by the action of the constrintor mascles of the pharynx, the cesophages is dilatod (for it usually lies in a collapsed state, with its walls in contact, or nearly so) ; this contaret of the pellet with its mucous membrane causes its muscular walls to contract, and the frod is thus driven, by a series of these contractions, into the stomach. 'The act of reglutition is now empleted.
5. Stomachal digestion or chymitication is the next mocess to be considered. The whole of the Alimentary Canal (q.v.), (fig. I) helow the Diaphragn (f.v.), or great muscular pretition which separates the cavity of the chest from that of the abdomen or belly, fos. sesses the following piouts in common, in relation to structure: The stomach, the small intestine, and the large intestine, are all lined by mucons membrane, have a museular coat, consisting of two sets of distinct tibresnamely, circular fibres which surround the tuhe or visens after the manner of a series of rincs, and longitudinal fibres romning in the same direction as the intestine itself -and are invested with a serous memhrane, the peritonemm (see Serous Mempranest, which at the same time retains the viscera in their promer position, and frmits; their necessary noveuents.
The human stumach is an clougated curverl pouch, lying almost immediately below the diaphragm, amI having the form of a

When form is intronared inter the stomath, there Gromal phomman are indmed in that visens: 1. 'There are ertain movemonts inhluced which ar"
dependent on its muscular coat; 2 . The mucous membane is altered in apearance; and $: 3$. There is the secretion of the gastric juice. Bach of these phenomena requires ia Irief notice.

On killing an animal whit the act of digestion is goine on, ind at once laying open its abdruen, we find that the stomach is in a contracted state, firmly embracing its contents, and with both its orifices so closed as ty werent the eseape of the fool, this contraction being due to the stimulation of the muscular coat by the fool. If we examine the movements of the stomach during digestion, which we ean do either by exposing the stomach of a living animal, or ly sembing a magreto-electric current throngh this organ in an anmal just killed, we perecive that, in the cardiate half or two-thirds, the movements are extremely slow, the muscular coat apparently eontracting on the food, and progressively sending it towaris the pylnoss; whilst in the pyloric end of the stomach the movements are more energetic and rapind, resenbling the pristaltic or vermicular movement, which we shall presently describe as occurring in the intestinal canal. When the transverse constriction has reached the fimuly shat pylorns, a relaxation lasting alout a minute cusues, followed ly a repectition of the circular contractions. The movements which thesp eontractions impress mon the fond are described ly Dr Beaumont in the following terms: "The fool entering the cardiac emi of the stomach, $r^{\prime}$, tharus to the leit, flescenis into the splenic extremity, $s$, and follows the great curvature tonards the proric end, $d$. It then returns in the conrse of the smaller curvature, and makes its apearance again at the carliac aperture in its descent into the great curvature to ferform similar revolutims, These revolutions are effected in from one to three minutes.' This account, given ly Ir Beammont, is based on the olsservations which he mate in the stomach of Alexis St Martin, a ('analian, with a tistulms opening into the stomach, whase case is referred to in the article Diet. Dr Brinton, howeror, adopts a modifiel riew, which is probaly the correct come. He supposes that the semi-thind food catering at $c$ (fig. 3), the cardiac

oritien, goes in the direntions marked a, partly alomg the ereater, and partly alnise the lesser curvature; and that thess two riments of from meet at the closed pylarns, when they are loth rellected into tho sirections 4 , fuming a eontral or axial current, arcurying the real axis of the stomach whish mites the two anctures. The matual interference of thase cumonts at thoir lowhers canses a uniform almixtare of the varinus sulstances composing them, whiln the reflection of the mper and lower cuments into whe another insures an equal eontact of all the mass with the secreting surface of the macous membrame.

Thle elanges in the bumbs mombrane are mainly the following：＇The inner surfarn of the hataltiy fasting stomach is of a paler pink time than after the intronluction of foun，and while in the later ${ }^{-1}$ case the reaction of the mosine an tha surfare is very wide，in the fomer it is motral，on wom allar line．Dr Beammat frame（in the rase of Al Ax Nit Dartin）that，on the intrenduction of fowl into the stmmath，the wasela of 1 he manows manham Drame more injected，and that its colour hemam changed from a pale pink to a dow rand．A pure cobarless and slightly viscin duad，with it well． marked ache reaction，was then onserved to distil from the surfare of the mombrame，and tor followet in clrops，which trickled dnwn the walls，and mixal with the food．
＇That the gestric juie，whirh is the trom applime th the acid fluid which Dr lhammant siw expuing from the mucons mombrane，aml which is sectoted ar formed in the gastric tubes which we have alreuly described，is capalde of exerting a solvent action on fool，is proved by muncrus experiments． It was first ascertaned hy licammer（752），who obtained some of this that ly making animals swallow sponges with a string ittarherl，loy which he conld withdraw them．Ho thess shewed that almentary substances ont of the boly wore altered ly this thind in the sane manner as thry are changed in the stomach，and disproved the favourte thery of that period，which ascribel all the changes which the fool underwent in the stomach to a species of trituration．The subject of artificiald dieg，stion．or digestion out of the body，has，since that purionl， been carefnlly investigated loy many observers，and there is now no donbt that the changes which the foot motergoes in the stmach are essentially： chemiend，and not mechanical．

Two years before Beamont＇s experiments．Ihr Proat had ascertained not only that an acid flail is secreted by the gastric muente membrane of rablits， haves，horses，docs，\＆c．，during diowstion，lut that the acid is the muriatic or hydrochlnic acid，and it was supposed that the solvent action of the castric juice was due to this somree But experiments shewed that the solvent action is not clue simply to the adid of the gastrie juice，and that the latter must contan some ather ingredient which，either alone or in combination with the acil，can exercise this power．It was then discovered that the aldition of a portion of the gastric muens membram to water acilifies with hydrochloric acid produces a perfeet digestive fluid，due attention being paid to the temperature，which should he kept at abont $100^{\circ}$ ，or about the normal temperative of the interior of the animal body．Later observations shewed that we can obtain from the gastrie mucrus membrane the slecial organic matter on which its dicestive power deprends，and to this substance the name of pepsine has been given．The two essential clements of the gastric juice are then： 1 ．A free acid，whieh in some ases seems to be liydrochloric alone，aml in others a mixture of hydrochloric and lactic acids：amd 2．An organic matter，which is fomm on analysis to be hichly nitrogenous，and to be allied to the albuminates，and which we term jepsine．The best analysis of human gastric juice is that made by Schmidt of Dorpat，who，in 1s3：，had an excellent and rare opportunity of examining it in the case of an Esthoninn peasunt，Catharine Kitt，aged 35 years， abl weighing about 118 1ls．，in whom there hat existed for three yars a gastric fistula or opening． three or four Lines in iliameter，miter the left lireast， between the cartiliages of the minth and tenth rils． The introduction of frypase and a little water into the stomach，through tho upeming，oceasioned（eran in the morning，on an enpity stomach）the secretion

The only impurity that condal affect these analysers，is the saliva that pussibly mingt have heen swallowerl．

The guantity of the gastric juice sererted in $2 \cdot 1$ hours was detmmined ly Bulder and Sidmint（the
 in the chng $\mathrm{y}^{3}$ th of the weight of the lowly：If tha： latter ratho wore true for mom，a man of ten stom． weight would seerete alant lif lhse of this Hail daily．In the case of latharine kiitt，the mean daily quantity ammontol to no less than 31 lhs． ar tor mone than a foreth part of the weing of her looly．On this ealculation，a man of ton stme wind daily secerete of 11 ss ．of gastric juice．

The uses of this．thenid in reference to diepstion are clear．It serves mut only to dissodre，lut also to mondify the nitromemos clements of the fowl （such as albundi，fihrin，casein，and in shont，all anmal fond except fat，and the laod－fommens bortion of venctable food），converting them into new substanes，termed peptones，which，althonell they conincide in their chemical composition，aud in many of their physical properties，with the sulstances from whids they are derived，differ essentially from them in their home realy solnhility in water，and in varims chemieal relations．＇Thus，alhum on is comverted by the gastric juice into alhman－puptom， fibrin into fibrin－peptane，\＆c．According to the recent investigations（ 1559 ）of Aleissner，the athm－ minates are simultaneonsly decompricen ir lirnkon nit into pepones and sulistances whind her torms preapeptones，which latter are not funther chanoul by the aetion of the gastric juice，lut are convertend into peptomes ly the aetion of the pancratic juice． with which they come in contact in the duondmum．

All the loest ribservers agree that the gastric juice exots no apmarent action on the mom－nitrosemons articles of fool－namely，the fats and the carto－ hylrates（sugar，starelt，\＆e．）：as，however，the fats cxert a farmable intuence on the dipestion of nitrogenous matters，it is prolalle that they umbrown somu slight，althoush met aprecialide，manitiention． Gelatine and the sedatimems tissues are，as fir as is： known，the maly nitrosenoms articles of fow whinh are not converten intopeptones and parapeptones hy the action of the gastric juice．

Althoush the manin olyect of the gastrite juice is to dissolve the allmminates，se．（e．g．，the contents of the ures，thesh，cheese，\＆e．），it aprears from the expe－ riments of Ldmann，schmidt，and othere，that it commot dissolve the quantity necessary for the clue mutrition of the organism．According to Lehmann， qastrie juice can mbly dissulve th of its weight of commatal allmmen，while schmidt makes the quantity as low as th．Now，since a doy secretes alwat $1^{\prime}$ th of its welght of mastric juice dails，it woml culy he ahle even taking lehmann＇s esti－ mate，which is more than twice as high as Schmidt＇s －to drome ja parts of dry or coagrated albman

## DICESTION.

for every loon parts of its weight: lut a cluge in on $h_{\text {tr }}$ to keep in condition on an exclusive flesh diet -aul this is its matmal frod-sbould take sol prots of thesh, contaiuing 10 parts of ary albuminates, for every loon parts of its weight. Honce its mastric juice only sulhees for the lagestion of half the albuminates necessary for untrition-a result which is in accordance with the olserval fact, that a emo siderable portion of the albuminates eaters the duobenmm in an nodissolved state, and which will le explaned when we consider the part which the intestinal juice-the dhaid seereted by the varjous alames lying in the mucons membrane of the small intestine-takes in the tirestive process. On eombarimg the experments made on tlogs with those made on Catharine Kiatt, it appears that in the human subject the gastric dierestion of the allmmanates is much more imperfect fhan even in the dur.

The process of gastric digestion is sluw. Accoming to Beaumont's researches on Alexis St Nartin, the mean time reguired for the digestion of orlinary animal food, such as hatebre's meat, fowl, and game, was from two hours aud three-duasters to four hours.

The neat paint to be considered is: What beeomes of the matters that are thoromaly dissolved in the stomach? Are they absorlod, withont passing further down the canal? or do they pass through the pyloric valve into the duodenum, and are they finally taken up by the lacteals? 'C'wo of our bighest authorities in plysiulngical chemistry, Frerichs and Donders, maintain that the absorption of the peptones eonmences in the stomach; but the view generally adopited is, that the allommotes, \&c., which are converted into peptones, are for the most part taken up by the lacteals. The rapidity with which arpuens sulutions of iodide of potassinm, the alkaline carbomates, lactates, eitrates, \&c., pass into the loloon, and thence intor the wine, saliva, de., shews that the absorption of hluils must take place very shartly after they are swallowed, and there is Ditle doubt that the hlond-vessels (capillaries) of the stomach constitute the priveral clamel through which they pass ont of the intestinal tract into the hanot. Is the veins of the stomach, which are formen hy the union of these eapillaries, contribute

The structure of a villus (fig. (i) is somewhat
eomplicated, but we must enteavour to explain it, becanse, without tolerahly acourate knowhatre on this print, no one can umicrstand how most of the essential elements of fore (the allominates and fatty matters) make their way from the intestine tor the: blood. Each villus is powidel with an abnemant set of eapillaries, which doulathess absorb, thaid matters, which thus find their way directly from the bowels into the hlood (fig. 7). A single artery enters its base,

Fir. 7.
Vertical section of the coats of the small intestine, shewing the eapillaries and the heginnings of the protal vein. The arteries are not seen, not havinir been penctrated hy the injection which has been thrown into the portal vein.
$a$, vessels of the villi; $b$, those of the tuhes or follicles of Lieberkuln ; $c$, those of the muscular eont.
and passing up its centre, divides into a caprillary plexus, which almost surronds the villus immediately beneath the mucous membrane. From these arise smanl veins, which usually pass ont of the vilhis in two, three, or more trunks, and contribute to form the portal vein. See Circulatun.

The villus also contains in its interior one or more lacteals, which are vessels with club-shaped closed extremities, which absorb the chyle from the intestine. Their milk-white appcarance, when they are filled with ehyle, suggests the urigin of their name. The tissue which oceupies the cavity of the villos, in which the lacteals are imbedded, and which supports the eapillary plexus, is in a great measure made op of muclei and granules, except at the free extremity, where a yesicular structure, resembling very mimute fat globules, is apparent.
There is abundaut evilence that the function of the villi is comnected with absorption, and mainly with the absorption of chyle. 1. The villi exist only in the small intestine, where the absorption of foorl goes chiefly on. 2. They are most developed in that part of the intestine where chyle is first formed. 3. They are turgid, enlarged, and opaque during the process of chylification, and small and shrunken in animals that have been kept fasting for some time before death.
In addition to the villi, the mucons membrane of the small intestine presents numerous transverse folds, which are termed the valuale comiventes, from their valvular form and from their movements under water resembling the winking motion of the cyelids (fig. S). Each fold passes round threefourths or more of the gut; and in the lower part of the duodenum, and in the jejumma (the parts in which they are most fully developed), they are oftev more than half an inch in depth;
furtber on, they diminish in depth, length, and number, and in the lowest part of the ilonin they can scarcely lee trased. '1lum olject clarly is to imerast the extent of the absorlone mucons membran.
In addition to dimmonhmis follicles or tuber, which waist in the whole of the sinall intestine, there are other Mamlular or secreting struc. tures, imbedded in the submucons tissue of certain ${ }^{\text {ro }}$ tions of the intestinal tract. wheh require consideration. These are: 1. limmory glands, which oceur whly in the duodenm; 2. Sohtary glands, which seem to oceur ni all parts of the intestine, both small and largé : and : $:$ l'eyer's glands, which are usnally contined to the ilewm.

1"; S.
Suabl intiatine disterphat and hardwand by aloo. hol, and land men to therse the valulute conhaventes.

Brumbers oldands are most abumbant at the bylurie end of the duodenme. In structure, they resmble the panceras, their ultimate clements being buches of vesicles, from which minute docts arise, which coalesce and form larger dhots, throngll which the secretion is poured into tho duolenum. It is believed that they spercte a thud similar to the pancreatic juice. The solitury $y^{\prime}$ omdes wecur in all parts of the intustine, but are jurhap more nmerous in the jejunum than elsewhere: Each clams is a simple membraneus thask-shated vesiele, the neck carino sponding to the surface of the intestine, while the rommed base lites in the suhmmens tissue. The neck prescats no opening, and how the contents, which consist of muchi and gramur particles, are dischargel into the intestine, is nut clearly known. As we never see then larger than a mustard-seed, we may presume that, on attaining that size, they burst. P'eyer's glumels (ig. 9) are apharently mero

Fig. 1.

ageremations of sulitary slanls, formine oval patches in the ileum. These patches vary in size and number. beiny largest towards the cechm, where their lond diameter sometimes measures three or four inches. and smallest towards the jejunum: while their number varies from fifteen to twenty, or even more. Nothing certain is knoma regarding the uses of these solitary or aggregated glands; but as they 563
are larent during the digestive process, we must inter that they are in some way connected with that finction. Tossibly, the peculiar onlow of the fanees may le due to their sectation. In typhind ar enteriu forer, and in phthisis, these giands become ulcerated, Which probathly occasions the diarrhere so common in these riseases.

Jhomaces glands are moch more developed in the herlivera than in the carnivon: I'ver's, on the other hame, are most dewored in tha latter.

We have endeavourd, in the preceding sentences. to give the reader some itea of the compliated structure of the macous and submucons coat of the small intestimes: we new proced to motice the chief uses of the muscular cont of the intestine. "This coat, as has been alrealy mentioned, consists of two layers of muscular filmes-manely, circular and longitudinal fibres, of which the former lie next to the submucons cont. The peristaltic or vermienar action liy which the sulntances which enter the duwlenm from the stomach are movel onwards, is due to this muscular cont. A person who has ance sem the almomen of an animal laid open immediately after cleath, will have a better ister of the nature of this merement than can be afforded by any description. It commences alunt the pyloric thirl of the stomach, from whence suceessive wave-like movements are proparted though the entive length of the intustmal cimal. It is the rapid succession of those alternate contractions aml relaxations that impols the intestimal contonts monarls, and weasim those movements which, from the ir resemblane to the writhings of a worm, have been tomed romiculor. It is very pubable that the rapidity If this movement varies in different imdivimalsthose persons, for example, whose howels act twice daly having a more rapin remicular motion than thase in whom the ant of defacation occurs only once in the twenty-fom burs.
We have now to consider the effects problucen on the elyme ly the different fluids with which it becomes mixed in the small intestinc. These fluds :re: 1. The bine: © The pancreatic juice: aml, 3 . 'Thlw intestinal juice.

The bite (sec Bilef) is a faintly alkaline on mpatral Hhais, enntaining two exsential comstituents, one of which is of a resinous natime, while the cother is a phiment. The reximous constituent is not frocisely jhentieal in all kiuds of like. lat it generally mon-
 of tauro-cholice acill (q. w.), of of a mixture of these Salts. Strecker, to whon we are mainly indmend for wur knowletige of the chemistry of the hiln, states that in most mammals the resinous constithent merely ditters in the varying promations in Which the tamrocholates and glyeoclolutes are intermixal, the former msually prequilerating. Arcondine to Ledmam, the resinoms constituent ammants to at least 75 pren cont. of the solid residuc. The bilefinment oecurs in the hile of different animals imber two froms- mamely, as a brown and as a prom pinment, the later protaldy only differing fom the funmer in beine more highly oxilised. "More has
 an enporthaty of dirertly wherving the quantity of hilh that is searroted be the hmman subject, and all var infurmation on this sulbject is derived from ubserat fons on animals, in which the duths chole-
 fistuloms onnmine estahishod into the gall hadoner. If the sum propertion of lila to bodily weight hodes tonnl in mont in in the done, at man workhine tom ton wonk s.eme daily almat five pamis of bila: All whomers aure that the amonnt of the bitiary

line escapes externally, instead of making its way into the duodenmm usually have voracions apmetites, axperiments on this point are easily made. There is great discrepancy of mimion as to how soon after ${ }^{\circ}$ a jueal the bile ilows most abundantly into the intestine. Accurling to Külliker and Mïller, whase experiments were made on dogs fed only ance a day, very little bile is socretem in the first and secont hour after a meal; more in the third, fourtio, and lifth; the maximum heing sometimes attaimed in the fifth, sometimes not till the eighth homr.

Numerous ami somewhat discrepant tiews have at dillerent times been alvancel regarding the fime. tions of this fluid; we shall bere only notice those functions which are comecter with digestion. One use that has heen ascribed to it, is to neutralise in the small intestine the acill chmme which emerges from the stomach. But the hile can contribute little or nothing to the neutralisation of the free acil, becanse, in the first place, the bile is very slightly alkaline, and often perfectly neutral; and secomily, hecanse the chyme in the intestine is still acid after the minixture of the bile. Again, the hile has been asserter to possess a special solvent action on the chyme; hat nome of the ordinary constituents of the lattor seem to be essentially changed, even when digesterl for a long time with fresh bile, Again, much impurtance lass been attachet to the antiscpiticaction of the bile on the contents of the intestimal camal, in favour of which view it is alleged that when oo hile is pmorel into the intestive, the faces have a putrinl ohnur, as is sometimes olserved in patients with jamolice, and as was moticed ly Frerichs in animals in which the Juetus choledothus han been tied. Amother use that has heen assigned to the bile is, that it cxerts a stimulating action on the intestimal walls, and thus acts as a matural purgative ; and in surport of this view, it may be mentioned that jaundies (in which the bile does not flow into the intestine) is often accompunied by extreme constipation, and that puritied ox-gall, taken cither in the form of pill or enema, produces an mumblited purgative action. lint the main use of the bile secms to be themonte the aigestion of fatty matters. and it acemplishes this end not so much hy any solvent chemical action on the fate (which at most is extremely slight), as hy a peculiar physical action both on the fats and an the intentinal walls, disintwrating the former, and impressing on the latter (by moistening the villi) a peculiar conlition which singularly facilitates the ahsorption of fatty matters. This view is fully contirmed hoth ly direct "xperiments out of the lundy. and ly comparing the relative gualities of fat that are retained in the luxly and applied to the purpuses of life ley anmals with biliary listulents openings, and by healthy animals.
The panceatic than which is pomed into the duotemmat the same ant with the bile (see fig. I), is a condondess, clear, sumbwhat viscid and reply than, havid of any special alour, and exhibiting: struns alkaline raidion. This that, as yidhled by dilfrent loiss with promanont fistulous openings, varies consiburally in chmonal composition: the colloction solal constitnents ranging from 1.5 to $2 \cdot 3$ per cent., the wrame mathes from $0!9$ to 16 , and the minral matters from $06{ }^{2}$ to $0 \% \%$.
'The most abmant aml important of the solid conditants is a preuliar substance temacl pancrution, in pameratic dastase or ferment. in comhimation with sorline t" which this lluid owes its primepal anmical and physological jroperties. (aldulating from tha ghantity of pancreatic juice socreated by dogs of kanda weight, we may infer that an main werhine tan stone sceretes daily about tori purnula of this thinit.

## DIGESTION.

One of the chice uses of the pancreatic juice in relation to digestion, is to convert into sugar tha amylaceons or starelyy mattors which have exeapest the action of the saliva, and linve passed nuchangel into the duodemm. It prossisses this propurty in in far higher degree than the sativa; ami, as might lue expected in reforme to this nse, the paneras is finmed to be much more develonest in herthivenos than in eamivomons aminals. fomand, the rejresentative of the moulam soloon of physiongey in Frawe, elams for this dluid another important fonctom; he ledinves that he has prowed that it is solely by the action of this sectetion that the fat is reducel to a conrlition in which it can be almondul amb digested; that is torsay, that it is decompeseal into slycerine and a fatty acid. see Eats. This view has, howeser, not been generally acespend, fow it seems probathe that although the chane described ly bernard takes place when fat and pancreatic jnice are simply mixel together in a test-tnle, it does not actually take flace in the intestine, the acil gastric juice prombly acting as an interforing agent. An attompt has lately hem made by Corvisart and Naissuer to prove that, like the gastric juice, this fluid can lissolve alhmmoms matters; lout this view camnt le substantiatenl. Comsilering the large quantity of pancreatic Hluid which is yielded in ot homs's, Schmilt, who hats mate the digestive jutices the subject of his special stuly, is of opinion that the function of this fluid is mot so bunch to promote the conversion of starch into sugar, as for the purpose of diluting the chyme, and for reconverting the sota (which in the baneras has been separated from the chlorine of the chloride of solimm, and has combined with the pancreatioc) into chlorite of sodim. Te shews, from mumerical ealculations, that more than half of the chloride of sodium existing in the blood which circulates through the pancreas, is lroken up into hydrochloric aciel and soda, of which the fornom is separated by the gastric chands, while the latter noites with the pancratine. Meeting asain in the dnolenum, the hydrochlome achl aud the sola reunite, and re-form chloride of sudium, which is again alsorbel, and reenters the circulatim. This is perhaps one of the most singular decompusitions and reminns oecurring in the animal boly:
of the last of the fluids poured into the intestine, and co-mpratine in the digestive process, the intostinal juice, we know comparatively little. It is the aggremate secretion of the ramions glands which we have described as ocourring in the walls of the snall intestine. It is a colonless, or sonetimes yellowish, ropy, viscin flum, wheh is invarially alkaline. We are not aware of any slecial or characteristic constituent in it, such as wecurs in the other elhylonenictic fluids. Its claily quantity is probably nine or ten ounces. It seens to wnite in itself the leading properties of the pancreatic and gastric juices; that is to say, it resembles the former in converting starch into sugar, and the latter in dissolving flesh anel other alhmminous bodies.

We shall conclude this part of the sulject with a few remarks un the chemical composition of the contents of the small intestine. On laying open the gut, we usually tind a semi-solid admixture of imperfectly digested and indigestible sulstances amd of the constituents of the digestive thuils in a more or less changed condition. The reaction of this mass varies in different parts of the canal, anm in some measure with the nature of the form. Thus, the contents of the stomach always reden litmus ]aler, whatever kime of food has heen taken: the duodenal contents are also always acid, hut in a fiar less intense degres ; in the jejnmom we medt with ouly a faint acid reaction, which altogether

7. We have now arrivel at the seventh stache of the dipestive process, that of hemention. 'The ham of demareation between the small and lave intestine is very obvious, and hy the perediar arrangenent of the ilen-cecal value (wee fix. 10), mattors are allowed to pass fowwrd with facility, while resur itation is impussible. For anatomical dotaila regneling the lar intustine, we may rofor to the articles Almextary (andi, C.tecm, and Comos. The contents of the liryg intestime difl'r very materially from those which we have been considering in the last laragraph, and constitute the ficees. They are mane solid and lomogencous, aml are uften monked into a derfinite shap ly the icells of the colon. The moly essential change which the contents malergo in this part if their

Howe they accumulate, buine frevented from weapine by the contriction of tlew ophincter muscle-a band of struber macular tilmes surmanding and closine the sut at its lower extremity: The alct of defacertion, of "f "xpmaion of the feces from the rectum, is effectesl pirtly ley the mensular fibres of that part of the intestine vilich are stimulated to

## DIGESTION.

contraction by a eertain degree of distension, and which are to a eertain extent under the influence of the will, and partly by the simmltaneous contractions of the abdominal museles and of the diaphragm. which, by reducing the anteropostering and transverse diameters of tho ahdominal cavity, compress the intestimal canal in such a mamer as greatly to assist the expulsive action of the rectum. 'These forces, or some of them (for usmally the detrusive action of the museular fibres of the rectun is suflicient), overcome the passive contraction of the sphincter, and the act of defacation is the result.

The freces consist of a mixture composed of undigested particles of food (such as vegretable cellular tissue, fragments of tendon, skin, and half-digested muscular fibre) of epithelium and mucus (derived from the intestinal walls), and of traces of deconnosed biliary matters. Their peculiar otour is aseribed by some to the secretion of Peyer's glands, and hy others to decomposed lile; while Liebig refers it to a alecomposition of albuminous matters, founding his view upon the fact, that ly burning albumen with potash, he could manufacture in the laboratory odours of a frecal character. The last is the least probable view: 'Their colour varies with the fuod. On a mixel diet, they are of a yellowish-brown tint; on a tlesh diet, much darker; and un a milk diet, quite yollow-and they lecome darker on exposure to the air. Their reaction is most commonly but not invariably alkaline. Their daily quantity is very variable; the mean of 17 observations made ly a German physiologist, Welsare was about 46 ounces, of which very nearly one nunce was solitl matter, the rest being water ; the larrest and the smallest ruantities leing ten, and rather more than two ounces. Lielig. many years aro, marle the olbservation that the insolnilile salts of the food are mainly earried off by the firces, while the solulide salts are for the most part climinated by the urine. Fur further details on the chemistry of this sulject, we must rufer to the elalorate Nemoirs of In Marcet, published in the Philosophionl Tramsactions.
8. The abosnption of the elyy forms the enupletion of the digestive act. 'lhe ewats of the intestines continn two perfectly distinct sets of vessels-one through which hood circulaters, and the other comtaining a milky or trinsprarent fluid, chylu or lymph, which, after a somewhat eiremitoms route, is pumen into the blome. We have alrealy referred to the fact, that lluinls are absorbed from the stomach and intestine by the veins and cappllaries of the muenos membrane; we mom froceed to motice the mone in whinh the rossels of the second kind, the lacteals, act as ibsorbiner asents. 'The lacteals are merely a portion of tho great lymphatic system of the buly, whell will he lleseribel in a future article. Sew Jyafideres. 'They' conmence, as has beon previonsly mentionnel, in the villi, and possibly also in the intorening mucons mombrane ; and when an animal is killert while the digestive process is groing on, they have, in consequence of their leeing distembed with elyle, the peatiar white or milky appearmee which procured for them thoir manare of reas lechat, from their discoverer, Asellius, in liene. "They bass in wrat mmalors, and in a reticulated arrammanent, betwern the layns of the mesentery, the portion of leritoncum (i, v) which sumommis the gut, and motans it in ils proper position. After passin! throurn the masanterie rhands, where thair contents swat to beembme mone lighly organised, they make thair way to tho right siole of the abrtia in the

 two what foylio from this pouch, the thamete

of the aorta, behind whieh it runs to the leit side, and discharges its contents into the subclavian vein, close to its origin with the internal jugular, its orifice being protected lyy two valves. The nature of these contents has been already described in the article Chylf. This chyle is, in reality, incipient blood, which has been formed, as we have already seen, from the food, and has been absorbed from the intestine ly the lacteals. We have now traced it to its entrance into the general circulation, and it only remains for it to pass, in conjunction with the venous blood with which it is mixed, through the lungs, in order to be converted into new and perfect arterial blood, fit for the highest processes of organisation.

We shall conchule this article with a notice of some of the most striking jecnliarities presented by the digestive organs in the lower animals.

In the manmalia, we have three different forms of stomach-the simple, the comples, and the compount. In the simple form, the organ consists of a single cavity, as in man, but the form may vary to a great extent. It is most simple and relatively smallest in carnivorous animals. This is the most common form of mammalian stomach. In the complea stomach, that viscus is made nj of two or more compartments communicating with one another, but often without presenting any marked difference of structure. The kangaroo, the porcupine, and the squirrel, afford good examples of this form of stomach, In the cetacea, the stomach consists of from tive to seveu cavitics, that communicate with each other; but whether their functions are similar or different is not known. The compound stomach occurs in the ruminants (the cow, sheep, camel, \&ic.) ; it consists of four distinct cavities, differing very materially in their size, and in the arrangement and strncture of the lining macous membrane (see tig. 1l). The first, and by far the largest cavity, is

## DIGESTION.

arrangent of the fining membran, which forms deep julyonal cerls) the lundeyomb or reticulam, $r$. The thiral eavity presents a fuliated applarane internally, and is hence populithly known as the manyplice, $d$. lı anatomical works, it is sometimps termed the patherium, and sometimes the omasum. The fourth division, termed the reed or abomasum, $e$, is somewhat of at Iyriform shape, and is the tru digestive stomach, in which alone gastric juice is secretad, all the preceling cavities locing merely for the purpose of preparing the fomed for the more essential changes which it is frere destined to mulurgo. The ford first passes in a crude ummasticated state into the prumeh, which, like the crop of hirds which we slanll presently notiee, serves as a receptacle for the foor until the act of fechur is concluded, and moistens it with the fluid seereted from its walls. The water, however, which the animal drinks, seems to pass directly into the seeond stomach. During rumination, small portions of the fool pass from the manch into this sceond stomach, from whenee they are returned, in the form of pellets, to the mouth, where they nodergo thorough mastication, and are then returned, as a pulp, by the asoplagus directly into the third stomach. The direction of the foom into one or other of these eavities is altogether intefendent of the will, and resudts from a peenliar arrangement and property of the lower end of the asophingus, which does not teminate at its opming into the panach on one side, and the second stomach on the other, hat is continued onwards as a decer groove or semi-canal, with two lips. If these lips eome in contact, they form a perfect canal, leading dircetly to the third stomach; while if they remain open, the food passes into the first or second stomach. The dry food first swallowed urens the lips and escapes into the paunch, while the masticated food, leine soft and pulpy, passes along the groove, without opening its lips, into the third stomach. Here it is diffused over a large surface of macous membrane, and donhtless undergoes eertain changes before entering the fourth or trie stomach. In the camel, the dromedary, am the llama, numerous ruws of larse quadrangular deep water-cells are developed on the parietes of the scomel stomach, ame on the part of the paunch next to that casity. These cells are surrounded by masenlar filhres, which, by their contraction, excluile the fool from their interior, and by their gralual orening, the water is allowed to mix in successive small quantities with the fool. It is loy this arrangement that these animals only require to drink at compratively lones intervals. The intestinal canal of the ruminants is of great length, being sometimes, as in the sheop, more than thirty times the length of the body of the anmal; and in herhivorous animals genemally, as compared with carnivorons, the eanal is very long.

It is in the large intestine that, next to the stomarh, we tind most varieties of stmeture. Luvier lass given the following résume of the principal facts connected with this subject, to which, however, there are numerous exceptions. I. In man, the orangs, and the wombats, there are both ceecum and vermiform appendix. 2. In the other quadrumana, the digitate carnivora, the marsmpiata, the rodentia, the pachydrmata, the ruminantia, the solipeds, and the amphbinus mammals, there is a cecum (often in vegetable-feeders largur than the stomach, ami probably subservent t" the digestive process), hut no vermiform appendix. 3. In the enlentata, the plantigrade carnivora, and the eetacea, there is neither cecum nor wermiform appendix.

In birds, as in all other clasises of animals, the alimentary camal varies acording to the nature of the fool, being long and caprious, and br sum
mats hichly masolar, in the gramomans tilese, while it is mach meres simples in those which live on fish and nothor ammal toms. Wi: takn the comamom
 12). The esephan', atout the midifla of its course, aud a little alowe the union of the "aviotes (the
 or ingluetes, which varies in form and stracture ancording to the from, and is provided with numerons glandular folliclos. Just lafore terminating in the gizand, the resophacus aysin dilates to form a second the smaller eavity, known as the glandalar stomach, proventriculus, or rentriculus succentmintus, c, froms whence a copious sucretion of gastric juice is pourel out and mixed with the fool, which, having proviously been macerated by the scoretion of the crop, now jasses on to the gizzard, $d$, which is a museular organ of immense strength, which grinls and crushes whatever is placel in its central cavity -a process that is facilitatiod by the presence of hard pebbles, which are instinctively swallownd by the bird, and aet the part of millstomos. There is no sery marked division in birds between the large and small intestiue, the theoretical limit leing inlicaterl hy the presence of two (sometimes moly one) capal apromiages, $f$.
'There are no special points that we need notice regarding the direstive organs of reptiles, exepht that as the ophidians (serpents) and samrians (lizards) are mostly camivornons, and most of the chehmians (torteises) are herhivorons, the apmatins in question is more smple in the former than in the latter.

The amplihia afford us an excellent illustration of the cluse connection butween the nature of the fool and the development of the intestimal eanal. In the young tarjole of the common fros, which lives mon the soft vegetable matter of our freshwater ponds and slitches, the stomach is narrow and clogatel, and the intestine is of extraorlinary longth, and of nearly equal diameter throu"hont, hous coiled up, in a spiral manner, ame distending the caparious abdomen. As the talpmbecomes metamorphosed into a frog, it changes its vegctalle from for slurs, woms, grubs, flies, \&e., and, at the same time, the alimentary canal hecomes very much shortened, and its divisions into stmanch, \&e., more distinctly marked.

In osseous fishes, the alimentary canal is generally shorter and more simple than in the higher verteIrata, in many-as, for example, the herring-heing shorter than the Lody, ank, execertine the stomach, ruming in nearly a straight line thrmoh it. In the cartidagmens tishes, as the sharks, rays, \&e., a spiral valve winds in close tums from the poloric to the amal extromity, leaving merely a small contral aurture, alone which the contents sluwly progress. By this singular arrangement, the intestine, althoush short in proportion to the length of the animal, bresents an eummus absurling surface.
The limits within which we mist eonfine this article, 1 rectude us from noticing the varims modifications which the digestive organs present in the various departments of the invertelrate animals; and we shatl cmulude with a few remarks upon the mode in whels direstion is earried on in some of the lowest and simplest animals. The hylue or froshwater polypue is a minute animal, consistmy of nothing but a hay or stomach, with tentacles surromding its single orifiee. Thu anmalculess ife, which the hydra catches by these lassa-like tentacles (see lyimi), ar" dramin into the interior, where they are digested, and applind to the uutrition of the organism, the inschable portions being rojected by the aperture thround which they entered. In the actinopleys sol, or sun-animalcule, there is no fursistunt aperture;

## DIGGING—DIIIONG.

but when its radiating filanents-from which it derims it : mame-have secured at farticle of or ised matter fit for its morishment, they twist over it, compress it against the globular holy, which lirst yiclds, and becomes concave at the print, and finally closes wer it, the prey being distinctly visible in the interior. This astomatons animalenle can thus fonu a month and stomach when it refuires them. The indigestible remains are ejected ly a corresponding reversed process. The amabla or sponye-protens neither las a month and stomach, nom can it construct these muas : it simply folls itself aromed the solid particles from which it derives its nowislment, am, imbibes their nutritious thads through its cell-wall. We might akluce various other examples of animals devide of a stomach, but we have brought forwarl sufficient evilence to shew that the old doctrime, that this organ is a necessary constituent of an animal, camont le sustained, when we apmonel that imatalle-land which semates the two great organised kingloms of nature.

DIGGINt: The mperation of digginy is performed with a spade or pronsed fork. The spale ur fork is thrust in witl the foot, and the mass of martl is iorst loosened by the lever-power of the handle, then lifted and inverted. When this operation is promond in spring or summer, the ground slanuld be diy, so as to ohtain pulverisation as easily and to as great extent as possille. In stronger suils, which are dur in autum, a little moisture is desirable, as the land lies fallow, amb the frosts of wintor afterwards pulverise and reluce it to a proper degre for receiving the crops in spring. Digging is almost entirely confineal to the cultivation of gartens, for thongh a most efficient means of cultivating the soil, it is too expensive for fieldcrops. It is ahmost always mesorted to, bowever, in this comatry for diremis owe or trenching land which has been in timber, in full of stones or boukers. Until recently, the siade was the only implement used for dicring in wridens, hat ste ${ }^{\text {and }}$ forks are coming rapidly into nse, being lighter anl more casily ariven into the soil. Tesides peparing the land for plants, the spale and the fonk, chielly
 and carrots, ont of the ground.

TI'GIT (Lat. dinitus, the finger), a term appled to the ten symbels of momber, $19,1, \underline{2}$. \&c. to 9 , thas. ars is said to be a number of thece dinits. Nombers were urigmally indicated by the dinuers, and hence the name. Astronomers use digit to signify a twelfth-part of the dimeter of the sun or mom, and speak of an eelipse of seven digits, meaning that seven-twelfths of the diameter is corered.

DlaITALINE is an active primeinle present in Iripitelis. purpurect, wr foxglove.

DIGATA'LIS, a semus of plats of the matural arder serophalerincter, natives chiofly of then smoth of Earope and temprate parts of isit. Gue only, the common Finxianse (1). purpurate), is a native if Britain, aml is very ahmiant in some parts of the conntry, its large purph flowers often giving aby "phearime to fry banks and stecp hills. third, generally to exeention. The first ean searcely be regarded as a technical meaming.

DHAGENCE, the name given in France to a pmblic conveyance of the nature of a stage-coach. It is a hage strong built veliche, with foir broad wheels, weighing about tive tons, and is drawn by four stout horses, at the rate of about six mites an hour. It eonsists of three chief compartments: the front, called the cound, for three persons; the scom, called the interieur, for six persons; and, lastly, the rotonde, entered from behind, for six persons. Aloft, in front, is the bonquette, where the conducteur is seated: and behind this, umberneath a thick leather covering, passengers are sumctimes hadded among luggage and gools, with hatle regard to their comfort. All the places in the bouty of the velicie are numbered, and assigued in the niler of booking. Usually, an effort is made to be booked early, in order to secure corner-places. In hooking, it is enstomary to pay only a portion of the fare, called arthes: the remainler leing paid at the end of the jonrnes. Fur the arrhes, a receip or bulletin onght to be given. Withont this security, a traviler may be put down half-way ami cheated ont of his fare, or he may be compelled to pay nver again. The driver being enneerned noly with the horses, the entire manacement of the rehicle, including the charge of the drag or break, devolves on the combintenr, a trastworthy but most dietatorial fersonake, dressed in a hatue choth jaeket and cap, and havare a ladge on his lyeast indicative of his dignity. The greater number of the diligences in France belong to two companies in Traris-the M"ssayries Imporiales and the Messumerins bentrales. The system of dilipences, however, has been latterly much bruken up by railway trausit.

DILL (Anethom), a gems of pants of the natural oriber Tombelleper, having compound wolsels withent general or bartial involucres, the border of the calys mimate but 5 -toothed, yollow involute petals, and dursally compressed lenticular fruit. The common 1). (A. grazeolens) is an annual or biemial plant, which grows whll in confields in the East and in the comotries aromul the Mediterranean, lout is guite hardy in Britain. It has from a very carly period been in general enltivation as an aromatie, stimulant, and carminative. It has is stem 1 -i fect ligh. bearing at tip a flat umbel of 10-30 rays; the leaves much divided, and the fimal semments threal-like. It has a strong peculiar armatic sucll and taste; the leaves are sometmes usend for thavoming ficklos, sauces, \&e. The fruit (Hith werel) is used in nedicine, chictly for relicf of thatuleme and gripinc in infants, and is amministeren in thes form of Jhill Wrater, in the preparation of which oit uf bill is amploycil; a pale-yellow essential ail, on whech the prof rties of the plaot depent, and which is obtrincel by distillation, -Sowa D. (A. Som ) is a mative of longal, and is much cultivaterd in the bist Indies fur its fruit, which is varimsly used in nowlicine and flaworing. $1 t$ is a common ingredient in envics. The phat much resembles Common 1)., lut its flawner is stronger.

DHILANLACEA, a matural order of examenom Hinnts, comsisting chinlly of trece, shrubs, or lalfthmoldy plants, natives of tropical and subtropical raions, alliod to the matural order limanculemer (1.. v.), bat very difirent in general haht, and also ti, Matmolierore, whin in halit they mure resemble. They have usnally altornatu leathery leavers, withont stiphores. The fowers are somutimes solitary, sumetumes in mermes or pancles: the calyx of 5 Prei-tnat sipals; the corndia of filecidnoms putals
 2 J distin't or coherent, dry or sucentent, earpels.

The seels have an aril. Astringency is a general property of the onder; and a number of specius are used as vulneraries and for other medicinal purposes in their native countries. Some species of Dillenin are large trees, and afforl excellent timber. The youme calyees of $U$. scabrella and $D$. speciosa have a pleasant acil taste, aod are uscl in curries, and the fruit of $L_{\text {. speciosa, althongh very acid, is eaten with }}$ sugar; the juice, mixel with water, is employed in India as a cooling beverage in fevers. The fruit of $1 /$. elliptice is used to make a sance for fish in Amboyna. Many of the plants of this orler are remarkable for the magniticence both of their foliage and their Howers. Tt contains about 200 known species.

DILMA'N, a town of Northern Persia, in the province of Azerlijan, 50 miles north-north-west of Urmmiyah, and 10 miles west of the northern extrenity of the lake of that name. It is of considerable extent, has clean streets, and is surrounded by gardens and orehards. 1) is a new town, the former town of the same nane, distant about 4 miles, is now in mins. It is deseribed by St Martin as a very ancient Armenian city, and the large phan in which it was situated is still inhabited ly Armenians, Catlulies, Nestorians, \&e. Pop. of I. estimated at 15,000 .
DILUENTS (Lat. dilue. I dilnte), merlienes Whose parpose is to dilute the bloon, and increase the quantity of the excretions generally. The simplest and best of dilnents is water; but all watery fluids, such as lemonade, soda-water, beer, infusions or pitisans, tea, \&c, may be regarded as coming under this designation. See Demulcents.

DILU'VIUA, a term formerly given by geologists to those stratia which they belicved to have been formad by the Deluge, aml more particularly to the bouther clay. The altered opinions as to the origin of these beds have caused the word to fall into disuse. When the aljective-dilurial-is employed ly modem writers, it is to characterise those acenmulations of gravel or angular stones which have heen prodned ly sudden or extraordinary eurrents of witer.
DIME, the tenth part of a United States doilar (see Dolian:), and equal to about firepence English.
mimension. lu Gemmetry, a line, whether straight or eurved, has ouly one dimension, or measurement-namely, length ; a surface has two-length and brealth ; and a solin! has three dimen-sions-length, brealth, and thickness, or depth. These three masurements or dimensions determine all furms of extension. - In Agelara, the term diniension is applied in mach the same sense as depree, to express the number of literal factors that eater into a term. Thus, $x^{2}, x y, \mathcal{Q} b$, are all of two dimensions, or of the secoml dearee; $x^{3}, x^{2} y$, abc, $\frac{a^{2} b c}{d^{2}}$, are of three dimensions, \&e.

DMMNUV:NDO (Ital. diminishing), a term in Dhasic, having referme only to the prower of the sommi, and in no way affecting the tempo, as many think. Diminmendo can be applied to a single note, whon it is a lome note, as well as to a passage of mimy notes, Diminuendo is so nearly of the same moming as decrescomlo, that it is frepnently marked with the same sign, thoms

HIMLNU"TIONS, a worl sometimes used in Herahlry for hufernees, marks of eadency, and brisures, imlificontly:

DIAINUTIVES are forms of words, ehiefly of sulnstantives, in which the primitive notion has 1.wornme lass nued or duminished, as hillock $=a$ little hill. With Itthan'ss is associated the ildea of neatness, and also of needin: protection; hence diminutives

## DIMITY-DINANT.

are used as tems of enderment; sumetimes they imply contempt. There is perlaps no languagre witliont limimotives; and the most eommon methonl of formation is by the adlition of a syllable. This, how ober, is mot the only method: tip from fop, by attennating the vowel, ind kid from gode, ars ats gemume diminutives as hillock. The eommonest of the English diminative aflixes are ock, $k i n$, or le, which are of Gothic origin, ant of or let of classical oripin ; as in bullock, lambkin, kernel (littlo enrn), lancre. According to Dr Iatham, the terminathon limg, or rather ing, was orighally patronymic: " lala was the son of Eoppa,' was expressed in Anglo-kurn by lad rerss liopping. Frum the notion of the tilial relation, the transition is easy to that of littleness and endearment, as in durling, duckling. Contempit predominates in shaveling (a monk) anl otheres.

Jinimutives often ocour in proper names; Pakin is the dmainative of Petor, Jenkin of John. 'These have settled down into permanent and distinct names; lut in the langrare of fondness and familianity, rharles becomes Charlry, John, Johnny, \&c. In Lowland Scotch, this form of diminntive is not confined to proper names, but is applied to curry object, anmate or inanimate-ladilip, horsie, wific, firie. Sometimes one diminutive atlix is joined to another, as lussock, lassochie; and in expressions like a wee, wee bit horsikie, the diminution is carricd to the difth degree. It is prineipally in the montlos of the people and in friemily familiarity that these diminutive forms are most common; and some languages and dialects are rich in them beyond others. Italian is remarkable in this respeet, especeially the 'Iusean dialect: casa, honse, becomes casercelle, little house, and casarellina, protty little honse; from fratello, brother, which is itself a dimimotive of the Lat. frater, children, it is sabi, may be heard forming such fond wames as fratellinurciftiutto. The aflectionateness and bonhomie of the Gemmans expresses itself larcely in this form; rater, fathor. becomes väterchen, dear father : and even the $1^{\text {ro- }}$ nom du, thon, is made into duchen, ind duli.

Diminutives are not confined to noms : mhitish is the diminutive of the aljective white; and tipmp, soriblle, demelle are exanples of riminutive verbs. Oprosed to diminutives are Aubamentitives, which abound in the Romanic lamutures, especially in Italian, and express not only largeness, but coarse. nuss and vulgarity; casothe is a large honse; cutalliecio, a worthless horse. Our word ballum, which is of forcign origin, is of this form, and means a large ball. Sueh wotds as elrumbarel, lownout, buzard, seem to be genuine English augmentatives.

DI'MITY, a stont figured cotton falbie, used chiefly for hed-hangings. Tho figure or stripe is raised on one side, and depressed on the other, so that the two faees present reversed patterns. Dimity is commonly white, or of a single eolour; but varie. gated dimities are now made, the pattern and the ground being of different coloms.

DJMO'RPHOUS (Gr. dis, twice; morphe, shape or form) is the torm apllied to a substance when it exhibits the poperty of erystallising in two distinct forms or systums. See Chistallograluy. 'l'lus, sulphur, as found erystallised naturally, aml as obtained by the spontaneous evaporation of its solution in hisulphuret of carbon, or in chloride of sulphur, presents itself in erystals of the form of oetohedra, with a rhombic hase, and thus belongs to the prismietic systom: but when sulphur is leated to fusion, and then slowly cooled, prismatic crystals of an amber colour are ibtained, whieh belonir to the wolipue system. The latter form of sulphur is nut permanent, and the crystals gradually become
oparue, and fass into tho form of mamber ress we to

 pass into the prismatis fomm. Cabon is another illustrotion of rimoryhism. 'lhnes rimbon crystal. lises in the dimmond in the remular system ass the wotulerdron and allion forms ; whilu in tho (anditinn of graphite we lilack lacul (q.v.), its whainerl liy the cooling of ita sulntion in fused (alst inton, it iss in the form of heximenal arstals lafonemeg to the

 and some substances, such ats thre suldmate of nickel, sulphate of rinc, selomate of mirkn, and the selaniate of zime, (rystallist in thre daflurent systems, and are thas trimorghous.

DINAGEP'ORE, a city of the sab-preflucy ut lengal, with alout bo,000 inhahitants, stamls afj miles to the north of Caleutta, in lat. 25 " $3 t^{\prime \prime} \mathrm{Na}$ and long. $85^{\circ}: S^{\prime} \mathrm{E}$ It is watereal ly an oflset uf the Attree, ealled the Purnalradis, which, thometh the Mihammula, enters the Jower (ianues from the left. The 1 lace is devoid of architectimal pretensions.

DINAGEPOJE the district of the aluvementioned city, stretehes in $N$. lat. from $2 t^{\circ}$ os, to
 taining 3500 srmare miles, and $1,204,(n) 0$ inhabitants. 'lue comntry is that, its only eminemees hing mere umbluations; and, from dlue moximity of the Himalayas, the whole tract is little but a net-ronk of water-courses, many of the chanmels, huwever, becoming perimbically dry. The winds are more variable than is usmal e.lscwhere in lmdia, and hailstones are occasionally of such weind at to kill men and eattle. lice is the principal crop, whl tidu are simedarly plentiful.

DINAN, a very old town of France, in the IUpartment of cótes-lun-Nord, on the liame :io miles north-west of Rennes, and lat sollth uf Not Nalo. I'le situation of D, on the summit of a stecp hill of granite, and with the lance flowing throunts a valley giol feet belons, is romantic in a layh dence. It is surromided by high walls, piereed lyy fom gates, ani was fommerly defculd by a strong castle, part of which has locen conrated into a frison. In the olior district, the streets are crookthl, narmow, and steel, many ui the buthlings beine crazy constrnctions of wood; but in sume parts, its orerlamging hamses, amd arcales resting on carved manite jillars, present many picturesque arclitectural features, attractive to tho antiquary and the artist. The eathemal uf it Sameur is a leantiful ontate enitice, built in the limmanespue style, eontaining the heart of the famons French warrior bortrind du Gueselin. 10. has manufactures of line. linen and of sailecluth, of cotton and wrinllon grmis, beet-root-sucgar, \&c. It has also some barme bidiling yards, axd, owing to its position near the month of the liance, has a considerable enasting and inland trade. I'al. 7420. A few miles off lios thr willage of 'ursent, built on the ruins of the eapital of the ancient Curinsolitae. in the dields round about the village are still oceasiomally found anciont atensils, Foman coins, aud tritees of a tomple dedicated to Jlars.

IDNA'NT, a tomn of Jelgimm, in the province of Namur. It miles smoth of the city of that name. It is situaten on the Dleuss, in the midst of extremely lictnresquescenery. The most noteworthy buildings of $H$. are the chireh of Notre Dame, an ancient and richly decurated Gothic struture, and the turnbouse, mice the palace of the princes of Liége. D. las several salt-refineries, mills for sawing marble, some quarrics of which are worked in the vicimity,

## DINAPORE-DINOINIS.

paper-mills, breweries, and tinneries. It has also manufactures of woullen stult, paper, hats, eards. and entlery. 'The singertreat uf D., comprsed of rye-thour anl huney, is famous, ant has an extensive sille Pip. (i38s. 1), which dates from the Gth e., has suffered greatly from frequent sieges. In J 4CA, I 'hilip Inke of Bursumily attacked it with a stroner force, amd, when the town was takea, in retaliation for the hanging of the messencress whom he latl sont to smmmon the town to survender, he orderes Sho of the inhabitants to le tied in comples, loak to lanck, an! east into the Heuse. At this time, alsu, the town was lumed, and the walls levelled.
1)lNADO'lala, an mprortant military station in the suld-presilency of Fencral, stimels inn the rieht bank of the Ganges, abont ten miles alowe latna, in lat. $25^{\circ} 33^{\prime \prime} \mathrm{N}$, and loner $8 y^{\circ} 7$ V. The larrachs are spacions amt clegant; and the pojnlationexchusive of the earrison, to which it is chedty an apmentare-numbers about $\mathbf{\sim} 0,000$. In the matiny of 1857, I. Eccuires an momviable notoricty. on astl Juls, nearly feven weeks after the: commonement of the onthreak, the mative troons, consisting of three reaiments, rose against the ir ritheers, ant that in the presence of a Enropean foree, which, if well hamlesl, was as able, as it Was realy, to erush them. Alter eseapnor with compratively little loss, the insurents clinemes instinctively tonctlur, carriel on a dentory warfire on their own acconnt wath farious sheecess. sue Aterdir.

DJXITEIC ALPS, that branch of the Alpine system which commects the Julian Alys with the western rauses of the Ballwan. It rxtemils in a sunth-easterly direction, from Mmont klek, east of Fimme, to the mouth of the Narenta: and stretchiner along the burders of the Ahriatic, it spreals its rannitications thronsh the greatre part of cmatir, Ditmatia, and ITerzegrina. The [. A. the hirhest summits of which ire Moment lymark and Monnt l'molok, selfam exteted formo feret in lught. The range is mineipally ealearems.

 following yoar, professor of theologe Almut this jerim, he matwawarel to spreal the dnetrines of the reformation in Vance amt other cities of lals, lont withent silucess. In lGIt, he went to Nimes, where le preached for there years; and in 16is, he was sent tu the syinm of Dint. to requesent the Gemerea Clmarels. Here his talenta were so highly estimated that le was one of the divines aprainted to draw up tho artieles of the symul. He died at (toneva in 16!?. I). was a somewhat intolerant Calvinint: lout as a prawher, he was doppent, par. suasive and conscientious. His ltadian transation
of the Bille apreared in 1607 ; his Freneh, in 1644. Among his other works may he mentimed his Amntationes in Billiu (I607), De Fictitio P'ontificiorum Puryatorio (1619), and De Juste Secessione Iiformatorim ab Ecclesin Iromana (I628).

DJODON (Gr. two-toxthed), a Linnean gemus of fishes, now giving its name to a family, Iliorlontider (tipmodontes of Cuviry), of the orler Plectoynathi. The fishes of this family have no distinct teeth, but their jaws, which are shaper like the beak of a prorot, are covered with a substance like ivory, formed of the teeth consolidated together. This is reproduced as fast as it is wom away by use, and the month is admirably adapted for grinding down the crustaceans and sea-weeds on which these tishes feed. Their flesh is mucous, and that of some is regarded as poisonous. Nome of them are used fur homan fool. Some of them, particularly of the genera D. and Tetradon, have a remarkable power

Globe-fish (Tetraodon lecrigatus).
of inflating their borlies by filling their stomachs with air, the stomach heing extremely dilatahle, and assuming a globular form when distended, whence they have receiver the name Glode-Fish, whilst from the spines, which stand out in all directions. like those of a hedgehog when rolled up, as if for derence of the inflated body, some of them have been designated Poncercse Fish. When distended with air, they float in the water with the lack downwards, but are not incapable of swimming in this position, as was formerly supposed. The Dindontide are fishes of warm seas; one or two species, ocensionally wafted by the currents to more nuthern shores, are among the rarest of British fishes.-The Suxpisn belongs to this family. The name D. has recently-with the effict only of confusion-been given to a new senus of cetaceous mimals, of which one very rare slecies has vecurrem on the british coast.

DODORUS, SirmLES, a Greek histomian, was bom at Agyrimm, in Sicily. Little is known of his life beyond what is toll by himself. He lived in the times of . Julins and Augustus Cosar, trawnlled in Asin and Europe, and lived a long time in liome, collectine the materials of his great work, the complation of which occupied thinty years. This work, the Bithinthen or Lihrary, was a history of the wond, in forty lonks, from the creation to the Gatlic wars of Julius 'exar. It was diviked by the author intu three parts - the first of which, in six lumks, compristes all the Greek and foreign myths down to thy. 'Trojan war ; the second, in cleven bunks, contains thi" listory from the year llst r.e. ta the death of Aleximmer the Cireat; tha third, in 23 bow 2 , continues the narative of events from that
 fiwe books inn extant ontire; the wext live books ars wholly lost: the next ten awe ramplete; and of the manamber of the womk, ionsideralle fragments
 mathr ,f emtman or of armamement, his work woml have la we of the oreatest impurtaner ; lint he was in lodh respentes so deficient, that his history
has no practical value beyond what belongs to an imnense mass of raw, and now scarcely availalale material. His narrative is colourless and mono. tonons, and his diction, generally clear and simple, holls a sort of midde place between the pure Attic and the colloguial Greek of his time. The best elitions of D. are Wesseling's (Amst. 1740), the Derx-ponts ( $5793-1801$ ), and Dindorf's (Leip. 1825-183I).

DIEECIOUS (Gr. dis, twice; and oilion, a hahitation), in Botany, is term applied either to plants or Howers, when not only the flowers but the individual phants are unisexual-i.e., when male and female Howers are produced upon separate plants. D. Flants form a distinct class in the Linnean sexnal system; but in thus placing them apart, if the principle of arrangement had heen strietly main. tained, great violence woull often have been done to matural aftinities; D. species frequently oecurring in senera and families usually Monccious (q.v.) or hermaphrodite, and also monccions and hermaphrorlite species in those which are usnally dioecions. Tamiliar examples of D. plants may be seen in most sprecies of willow, Amongst cultivated plants, hemp, spinach, and the date-palm may be named as instances.

DIOGENES LÄE'RTIUS, the anthor of a bixgraphical history of the Greek philosophers, seems to have been born at Laerta, in Cilicia, and to have taken his surname from that town. So little is known of his personal history, that the very age in which he tlomished is a matter of doult. By some it is assigned to the end of the 21 , and ly others to the middle of the Bll e. after Christ. Ilis name has been lept alive liy his Lives of the Philosophers, a work which contains a great mass of interesting information regarding the private lives and labits of the most eminent philosophers of antiquity. Though the work is utterly worthless in respect of plan, coherence, or criticism, it yet contains so many I iquant amecdotes, and so many valuahn quotations from lost works, that Montaigne's wish was perhaps a justifiable onethat insteal of one Laertins, we had had a dozen. The luest edition of Laertins is that of Hiuhner, $\because$ vols. Sro (Leip. 182S-1831).

MIOMEDE ISLANDS, a group about the milhe of Behring's Strait, form, as it were, a number of stepping-stones between the most casterly loint of Asin and the most westerly of America. Their names are Fairway, Crusenstern, aml Ratamanow ; and their central point is in lat. $65^{\circ} 46^{\prime} \mathrm{N}$, and long. $165^{\circ} 55^{\prime} \mathrm{W}$.

## DiOMEDEA. Sce Albatross.

DIOMEDES, the havest, after Achilles, of all the fireks who trok gart in the Trojan war. llis exploits nepupy a monnent place in the record of the heroie dreds suns by Homer in the Iliand. Ho vompishod in tikht llector and Sineas, the most valiant of the Trojans; anl iven Mars and Venus, when they tomk the fich on the Trojan side, were attanked and woundol hy him. In the grames instituted by Achilles in fonour of Vatroclus, ho gaincel the jrize in the chariot-race, and worsted the mighty Ajox in siucle emmbat. Along with 1:Iysses, he "arrial otl the l'alladimm, on whech the fate of Troy depmedel. On returning to Argos (to the erown of whel he had suceended after the death of Adrastus), lar fomme that his wife had proved mafaifliful in his alschere. L Lavins lome, he went, accoulurs to mo tralition, ta Italy, where he took pirt with the Trojans acranst Thmos. Several rotion on the gontherm shanes of that comery clamed to have leen foumbel ly him.

DION CA'SSIUS COCOHIA'NUS, a celchrated Greek historian, was hern at Niesen, in lithynia, bis. A.r. He held varions high ollices of state timare the: lioman emperors, wats twe consul, and enjoyed the intimate fromedship of Septimius sumens. Me is Jest known by lis /History of Iowne in so lumise, of which only 18 (from the Bith to the Elth) have reached us complete. The others are only known to nes from fragenents and almemments. His high fusition gave him free access to $\mathrm{t}_{\text {a }}$ national ar him, and as an anthority on sume pornta, "sprially wn the imperial epoch of liomat history, his work is mot withont very considpable valne. Inte wrote on the model of 'rhucydides, to whom, indued, the is far inferior, lonth in vigour of julgment and acntrmess of criticism ; yet many passages of his 1 listory mirht be quoted as anomg the best samples of the rhotoric of the age in which he lived. D. dict at Nima, but the date of his death is not known. The best clition of his History is that of Sturz (Leip. 18:I $-1843)$.

DI'ON CIIRYSO'STOMUS (Golden-mouther), an eminent Greek rhetorician, was bum at ]rus:, in Bithynia, towards the middle of the lat century. Ilis father, Pasicrates, paid great attention to his edneation, which was also enriched by trave. 11., after residing for some time in his native town. came to Fome, where, however, he hat the misfortme to acite the suspicion of the Emperor Domitian. and was in consequence obliged to the On the accession of Nerva, 96 a.is, he returned to Rome, nunl was honomrably received. Nerva's suceesson, Trajan, held D. in the high'st estimation, even $j^{\mu r-}$ mitting him to ride lueside himself in the imperial chariot. Ilis excellent disposition prowured him many friends, while his remarkalile powers of oratory excitcl universal admiration. IIe died at Rome about $117 \mathrm{~A} . \mathrm{D}$. D. left a very great momber of orations, of which 80 are still extant in whole, with fragments of 15 others. They discuss questions in polities, morals, ant fhilosophy, and are written in pure Attic Greek. Accorling to Niebuhr, he was 'the first writer after Tiberins that greatly contributed towards the revival of 'ireek literatore.' A good edition of D.'s orations is that of Feiske (Leip. 1784).

DIONE'A, a very curions and interesting genus of $\mathrm{p}^{\text {plants }}$ of the matural orior Deaseracte, having a 5 -partite calyx, 5 petals, $10-20$ stamens, and one style, with 5 closely moited stigmata. Only one

Dionza,
species is known, D. muscipula, sometimes called Venes's Ply-trip and the Cabolina Catchfix Plast. It grows in mashy phaces in the wammer parts of North America, as far north as North ('arolina, and is a jerennia) plant, whth a rosette of root-leaves, from the midst of which arises a leatless
stem (seap. ahout 6 inches high, terminating in a corymb of whte fowers. It is remarkable for the imatalnty of its labwes. The laafotalk is dongitend, wimend, and leaflike, and hears at its extrmity an mbindir leaf, set romed at the margin with hong stioil lomy hars, amblhaving on its mper surface many smand glands, am? three delicat" irritahle hains in "ateln side, wis placel that an insect c:an harilly trawrer the laif withont tonching whe of thom, whon the: two sides of the luaf immodiathy foll together ugn it, and lay holl of it, the maremal bristles enssing me another, and promutm: the possibility of escance. The loai fors mot ofrn again till the insect is drad, and there is no longer any irritation caused ly its motiom. The juive from the glands seems to atfract insects; hut the use uf all this to the fllant is muknown, for that it sucks the juice out of its insect prey, or receives nomishment from the homies of insents dissolsed in a macilaginons exulation from its indads, has mily been conjectured, amd not prosel. Nom has the mper surface of the leaf any prickles which might jierce or lacerate insects. -The Donect is somctimes to be seen in hothonses.

DIONY'SiUS, the Areofasite, is mentioned in the Acts of the Ajostles (chap. xvii., versu 34) as mo of the fow persons in Athens convertel t" Christianty by Panl. A history has been invented for him lyy the churech. It is said that lie was in Euynt when the Crucifixion happenell, and olserving the celipse that acempanied it, exchimed: 'Either Goll himself is suthering, or he sympathises with some one who is sufferiny.' At the time when l'aul visited the metropolis of Grecee, I. was a member of the comedi of the Areopagns. whence his name. Tradition also declares that the a mastle installeal him as the first Bishop of Athens, amd that he sutlicred the fate of a mantyr. The writinus which are falsely current under lis name treat of such topics as the heavenly hierarchy, the names of dind, the erclesiastical hierarchy, \&r. Their theology is of the mystical kind. The sty]e, contents, and historic allusions clearly indicat that the author of these writings coull not hava tomishal before the close of the 5 th c ., ant, in fact, the writings first made their appearance in the Gth century. Dazzling neophatonig phantasies coneming the divine essence, ancels, and holy spirits, splendid descriptions of the cermonies of the Catholic worship, Elorifications of the friestly hiurarchy, panegyries on monastic life, and mystical interpretations of chureh doctrine, male the works immensely attractive, especially to the (ireck nonks, whose manner of life was pre-eminently contemphtise. According to a recent hyprothesis, the so-called writings of D . are the composition of some Christian I'latonist, who, in oprwsition to the net yet wholly extincuished finnsticism, sought to incorporate with 'hristimity the forms, ideas, and cermonies of the Dimysian (Bacchic) mysteries. The trandatiom of the work into Latin by Scotus Erivena, in the dawn of the militle ages, gave a new impulse tomonastionm in the llistern Church. and may be almost sail to have meatel its mystic theology. The Arenpagtic Throlngy was, in fact, the nam given during the modile ares, and even as late as the 1 Sth c., the that mystical methon of aprehonding relagions trath made current ly the writings ascrithad to 1)., and afterwards formally introluced into Latin "hrstianity he Hugo St Victor in the 12th century. This theology proceets upon the primiple, that the Divine anirit is indispensalide even to the milurstanding of man.
 was horn dill of $40 \mathrm{~B} . \mathrm{c}$. Ife was originally a clerls
in a phblic office, lat manifesten at an early period a prassun for political and mintary distinetion. When the A mimentines. after the conquest of them "ity hy the (arthamians, woused the Syracuson wherals who hat failed to relieve them of treachery. 1). supproted their acensations lafore the perple of Fyrarme, and induced the latter to apoont new rimmanders, of whon lo himself was one. But in a vory short time he suphinted his collearnes also, ank, when only 2.5 vears of age, mante himself. by the loll, of his mernemaris, alsolute rulew of the "ity. I'o strengthea his "tyranoy' (the name given ly the dreeks to any mampol anthority, however wisely and bencficently exereised), he married the dameliter of llemmerates, the late hear. of the aristocratic prarty, aml thus attwlyed the followors of that lealer to himself. After he hat fierecly suphrossed several insurrections: and conquered souse of the freek towns of sicily. he made preparatims for a great war with the Corthaginias. It lowke ont 397 F. 4 . At first, fintume fatomrel 1). but after a short time he sulferem a sories of reverses, sforamitons, that all bis allies ablandomed lime, aml he was shat ur in the city of Syracuse, apprarently without home of eseale.  ghal mombers. The thest edtion is that of firmate (Tombures, $1(50)$; there is a derman translation by Schulz (bral. 18"2).

Diopsis Ichneumonia :
1, magnified; 2 , natural size.
DOOPTRICS is that branch of geometrical optics (see Opries) which treats of the transmission of rays of lioft from one medium into another, differing in lind. It consists of the results of the application of geometry to ascertain in prortieular cases the action of what are called the baws of refraction. When a ray of homomemons lisht is incident mon a surface, the angle which its direction makes with the normal or 1"rpenticular to the surface at the point of incidence is in dioptrics, as in catoptries, called the angle of ineidence. The angle which the rofractel ray makes with the same line is called the angle of refraction. This being premisca, we may state the laws of refraction. 1. The incilent and refracted ray lie in the same plane with the nurmal, at the 1 wint of incilence, and on opmosite siles of it. 2 . The sine of the angle of incitence, whatever that angle may le, bears to the sine of the angle of refraction a cmutant ratin dependent only on the nature of the media between which the refraction takes place, and on the mature of the licht. Accorimer to the secomd law, if we call the angle of incilence $i$, and that of refraction $r$, we shall have $\sin i=\mu \sin r$, where $\mu$ is a cquantity depending npon the mature of the media and of the light. It will have, fin instance, a eertain value for refraction from yacmm into glass, another from glass into water, and so con ; also it will have one value for red light, anothur for green, and so on. The quantity $\mu$ is callerd the refractive index, and is greater than I when refraction takes place from vacuum iuto a melium, an! in general is greater than 1 when the refraction is from a rarer intu a denser medium, and less than I when the opposite is the case. In dioptrics, the laws of refraction may be considered as depenting for their truth upon experiment ; in physical opties, they are dednctions from an hypothesis respeeting the constitution of light. They are not merely approximately true; they are alosolute physical laws.

Before proccenting to consuber the simpler leme ing eases of refraction, one or two interestins propositions in dipptrics require to be explaneth. 1. If the refractive imbex for a medimm, when light is incident unom it from vacum, be $\mu$, tum the index for another medinm, under the sume circumstinces, le $\mu^{\prime}$, then, when light procents from the second medium into the first, the refrae-
tive imbox is ${ }^{\mu}$ ' The prowf of this prapmition
 laws: (1.) If a rive of lioht promend from it fuint l',

 reverse common tol'. Thas is proverl ly exproment,
 joiss from vawnm thonsh athy mamber of monlia, lawing their firme fund and parallel, when the ray
 time will be pormallal ta that whal it hat lafore incibure. 'T'0 deduer the froposition from these laws, let $i$ le the anerle of inchlolle from vacturn wom the madinan ; (liss ]), $r$ thes abghe of refraction, which will also lut the ancole of incidence unim the menlimm A. Also let $r^{\prime}$ be the angle of refraction into A, which will also be the angle of immbince "pon the secmul boumbing surfiwe of A. By tho scennl of the preceling exje-

Fig. 1. rimuntal laws, the angle of rmorgence into vacumm will he $i$. Hence we shall have liy the first of these laws, $\sin i=\mu^{\prime} \sin r$ ut the fint surface, and sin $i=\mu \sin r^{\prime}$ at the secoml. From these equations, we lave $\sin r=\frac{\mu}{\mu^{\prime}} \sin r^{\prime}$, Which proves the popmition. It fullows that if $p$ he the refractive index from vacumm into a medium, that from the medium into vacumn will lue $\frac{1}{4},-2$. Ow second ympusition relates to what is called the roitionl anylt. If $i$ be the angle of incidunce of it ray within anedhm, the refractive index of whinl is " $s$, and $r$ the angle of refraction into vacumm, then Wr have from the former proposition $\sin i=\frac{1}{\mu} \sin \pi$. From this formula, if $i$ be given. $r$ may be fommi, and a real value will be given to $r$ so long as sin $i$ is $<\frac{1}{\mu}$; but when $i$ has a value greater than that determined loy the equation $\sin i=\frac{1}{\mu}$, the formula fails to crive us a value of $r$, for the sine of an malo caqnot lue greater than 1 . And experiment slews that, in fact, there is no refracted ray whon the absle of inciulence is beater than that alowe assignel, the ray being wholly ruflecterl withm the nedium. 'The angle of which the sine is $\frac{1}{u}$ is called the eritimi cmyle. For glass, it is alomat $41^{\circ}$ fot for watur, alunt $45^{5}$ :or'. This oncle is
 intermal reblection at the surfaces uf morlia, the reflected licht is mure nealy armal in intensity to the incidunt than in any other case of retlection. While it thas appears that refraction from in benser into a raver mentium is nut always possible, $^{\text {mata }}$ it may be alded that it is always pussible from a ramer into a demser.

We shall now investigate smme simple eases of refraction. 1 . And first ut refraction at a plane surfice Lat lll MX (tig. o) he any mestimm loommed by a llame IO, and let $E$ be a ratiant pmint, ami lif aml lil two iucident ravs of a diverent funcil frocerling from $a$ to the surface of the mentim: then $I$ IL heing perpendicular to the surfiue. suflers an refraction, lout Irmceets aloner I I ll within the medium; bot lil is refracted in the direction $I N$, which, produced ontwards,
meets the normal INF in F. Therefore, a small pencil of rays procecding from $R$, and having FD, perpendicular to the surface, for axis, will be refracted into another peneil diverging from the imarinary focus $F$; for all the rays intermestiate between Li , and $12 I$ will converge very near $F$ whed the pencil is small. An eye within the medium, and between $N$ and $M$, would thus, the pencil being small, see the luminous point $R$, as if it were at $F$, or further off than it really is. In the opposite case,

Fig. 2.
represented in fig. 3, I being within the refracting nuedim, similar reasoning shews that after the rays emerge from the plane surface into the air, they will, if the pencil he small, appear to proceed from an imaginary focus $F$, nearer to the surface than F , the luminous point.
2. The ease of refraction throuch a prism, which we are next to consider, is, in fact, the case of refrattion through a medium bounded by plane surfaces Which are not parallel. Conceive two planes at right angles to the plane of the praper, and making on that plane the figure BAC (fig. 4). The question is as to the laws of transmission of a ray, SI'Qle, of homogencous light through the , prism. Draw $m n^{\prime}$ and $n^{\prime} n$ per-
 pendicular to the siles. Then $n^{\prime} \mathrm{P}^{\prime} \mathrm{Q}$ ant $n^{\prime} \mathrm{QP}^{\prime}$ are respectively the angles of refraction at the first, aud of incidence at the second surface. Now, as $n^{\prime} Q A$ and $n^{\prime} P^{\prime} A$ are each of them right angles, and as all the angles in the figure n'QAP are equal to Fig. 4. four right angles, it fol lows that the angles at $n^{\prime}$ and at A torether are equal to two right angles. But the angle ait $n^{\prime}$, fogether with the angles n'PQ amd $n Q P$, are equal to two right angles : thorefore must the angles $n^{\prime} P Q$ and $n^{\prime} Q P$ together bur cural to the angle at A. In other words, in refraction through a prism: The sum of the angles of refraction at the first surface and of incidence at the secont, is equal to the antle contained between the plane sites of the prism. From this it might be shewn, that the deviation of a ray cansed by passin, through a prosm is always towards the thicker part of the prisu, if the medimm be denser than the surromiding atmesphere. It is a gemmetriral proposition which the stulent may solve for hamself, that if $i$ bee the angle of incidence at the lirst surface, aml e that of emergence at the second, and if of be tha angle of the frism, then $\delta$, or the change of direction of the ray in its passage, is whatand from the formula $a=i+e-a$.
:i. We suw take up the case of refraction at a single spherieal suface of a medium donsur than then surmumber air. And first, of parallel rays refrateol at acomvex spherimal surface. Let Able (fis. 5h le the refracting medim, whose terminating

379
eonvex surface is spherical, C being the centre of the surface, and $V$ its vertex. Let $X V$ be the axis of a pencil of parallel rays, of which any ray, lit, is incident at I. Then, if CIN be a normal, the angle of refraction, CIF, will be less than the angle of incidence, RIN, and the refracted ray will thus turn towards the axis, and meet it at some point, F .

Fig. 5.
When the nencil is small, or the aperture, AYB, rif only a few degrees, the rays will clearly nearly all converge to the same point, $F$. To find the position of $F$, we have, in the triangle ICF, the angle $\mathrm{CLF}=r$, the angle of refraction, and $I C F$, the supplement of 1 CV or NIR (ly parallel lines), i. e., of $i$, or the angle of incileace. Therefore, IF is to CF : $\sin i$ is to $\sin \%$ And as for a very small rencil, 1 F may be taken $=\mathrm{TF}$, we have FV:FC $:: \sin i: \sin r$, or $:: \mu: \mathbf{I}$. And putting $\mathbf{F V}=\mathbf{F}$, the principal focal distance, and $\mathrm{VC}=\mathrm{R}$, we have $\mathrm{F}=\frac{\mu}{\mu-1}$ I. If the medium be crown-glass, for which the value of $\mu$ is $\frac{3}{2}$, we have $\mathrm{F}=\frac{\frac{3}{2}}{\frac{3}{2}-1} \mathbf{R}$, or $F=3 R$; i. e., the principal focal distance is equal to three times the radius of the sphere. The stndent may, by similar reasoning, ascertain for himself the focus of parallel rays incident on a concare spherical refracting surface, as also the focus in the case of a pencil of parallel rays within the medium and emerging from it. The case of a divergent pencil is incapable of such clementary treatment as to justify its insertion here. For hranches of the subject, treated under separate heads, the reader shonld refer to the articles Causice, Lens, and Refraction. Under Refraction, he will find a talle of the valnes of $\mu$-the refractive index for various media and kinds of light. See also the articles Spectron and Chmomatics.

## diolidima. See Payorama.

DIOSCOREACEA, a natural order of plants, of which the genus Dioscorea (see Yis) is the type. 'They are twining shrabs, with large tubers, either above or below gromul. They are gencrally classed with endogenous plants ; they are ansonir the Dictyogens of Lindley. There are about 120 known species. The most important plants of the order are the diflerent species of Dioscorea or lian (IJ. v.). Iilack limovy (I. v.) is its ouly representative in the lritish flora. Testudinaria plophentipes, a South African species, sometimes called Elephumes Foot, ami Mothentots' livead, has a large lleshy rhizome, with a rough crackell lark, whieh is used as food ly the lIottentots in times of scarcity.

DIOSCOTADES, Pembines, or Pedacies, a Greck physician, was a nativo of Anazarha, or Anazarlms, in Cilicia, and flourishend in the Ist or al c. of our crat. 110 acompanied tho lioman amies as physician throngh many countrics, amb collected a great store of infomation and personal olservation on phants. In his great work, De Mutcrid Modica, he triats of all the then known medieinal substances and their propurties, real in rupater, an the principles of the so-callod 'humaral pathonoty.' T'wo other works bear the name of D., lout their genuineness is very

lll', in Geology, is the inclination oi strata downW:ards into the earth. 'Ihe ammont or angle of clip is the degree of deviation from a lowel line, or the plane of the horizon. The point of dip is the point of the compass to which the dipe is inclined.

DIPJITHE'RIA, or DIPIITUERI'TIS (Fr. diphtherite, from Gr. diphthere, a pellicle), a name first applied by M. Bretommean of 'lours, a distinguished french plysician, to a form of very fatal sore throat oechrring epidemically, chicfly in chilimen, and ant to le confounded both with Gronp ( $(\mathrm{I} . \mathrm{v}$ ) and with malignant sore throat (ingime malima), as it is fomal in connction with Suarlet Fever (q. v.). Diphtheria is distinct from lootly these diseases, not only in its symptoma, but in the character and prosition of the morbid changes on the mucons membranc. In croup, there is a pellicular membrane, indeed, but it is almost confined to the air-passages, and centres in the Larynx ( $\left.1 . v^{\circ}.\right)$; in diphtheria, it usually legins in the pharynx or back of the throat, and often extends down the asojhams. on gallet. Cronp is also a much more decidedly mummatory disease than dijhtheria. Nlalignant or uleerative sore throat has even less in common with diphtheria; for in the latter there is no ulceration in the majority of cases, the mucous membrane heing merely covered over with a more or less thick veil of false menhane; in both affections, however, there is enlargement of the glands behind the ear and in the neek, generally in the neichbourhood of the parts internally aftected. The throat affection in diphtheria is oftern accompanied by a very low and damerous form of fever, with great and rapid loss of the latient's strenath, which is still further roluced of course by the inability to take food; in other cases, the discase is fatal by suffocation, and tracheotomy has been performed (in some few instances successfully) to relieve the patient from impending death. After the acute disease is over, the recovery may be delayed by paralytic symotoms of varions kinds ; or simply by extreme debdity, with exhaustion and loss of appetite. Diphtheria was supposed by Bretonnean to be contagious, but it is doulited by many whether the evidence of contagion is sufficient. There is no good evidence of any specific cure. The use of the tincture of muriate of iron in large doses (fifteen to twenty drops frequently repeated) has been recommended; also varjous disinfectants and canstics applical to the throat, as nitrate of silver, hydrochloric acid mixed with honey, and latterly Condy's disinfecting Huid; but all of these have also frequently failed in the hands of expericneed physicians. Miphtheria does not appear to be so much maler the influence of linown sanitary conditions as other epidemics; at least its modes of origin and diffusion are still cxtremely uncertain.

DI'PHTHONG (Gr. having a rlouble sonnd) means two rowel somds following one another so closely as to form but one syllable, as in out. In this combination the sound is really composed of an $a$ as heard in futher, and a $u$ as heari in mut. Many double vowels in linglish are not real diphthongs, there being only one sound heard. The
spelling of thre Enolish language lazs littla or wo relation to tho prommaciation in tlis mathor. In many syllables waten with two vewels, only one soumd is beated, is in brent. 'The singlo vowel
 the longs somme, as it is calloch, of $i$ is meally conmpersert of the somud of $n$, as hoard in futher, and that of $p$,
 rather tyum. Sinch wards as biresel, fille, which are now monophthonges, were doubtloss at one time roal diphthones, and are still so promemeed in many parts of lingland.

DIDIAM: ${ }^{\prime}$ NTIITS, a genus of frossil manoil tishes, Ieenliar to the ohl red samistone, in which six species have bern fomand. The body was rovaral With very small scales, and the tail wis beterocereal. 'Hhere were two dorsal fins, which with ench of the other lins were farnished with a strmes suine in front, the base of which was simply imberiderl in the thesh, as in the doo-tish, and not artienlated, as in the silurods. "The lead was large, and the month wide, and openimg oblicuely.

THPLOCRAPSUS, a genus of fossil zoophytex, differing from the Graptolite (q.v.) in havinif a donble series of cells. They are foumd in wreat abmmance in the anthracitic shales of the silurian mensures.

DHPLOMA (Gr. diploú, I double, or fuld). This tem originated in the anciont custom of writing solemm documents on two talalets of wax, which were doubled, or laid one upou the other (sce HIPTYCU), or on writing material which was folded. The Lioman emperors were in the habit of miving diplomas to public servants, and to comriers, to cnable then to procure the use of the public servants and horses; bence diploma came to simafy a royal charter or prince's letters-patent. The term is now mostly applied to instruments given by universities and other learned socictics, in proof of the holler having attained a cocrtain regree; or to the licences hedd by jrofessiomal persons to practise their art.

DHPLOMAC'V, the art of manaminer the inter course and adjusting the relations of foreisn states, by means of ambassadors, envoys extraurlinary, consuls, ©e. The principles and rules of diplomacy are cmbodied partly in those international customs and usages which constitute what may be called common, and in those treaties which may lom regarded as statnte international law. The diplo. matic relations of this country are jractically under the superintendence of the Secretary of State for Foreign Affairs, lat the power of sending ambassadors to, and receiving ambassadors from, foreign states, is an inalienable privilege of the crown. It was doubted whether an exceution har not been made in the case of Rome, by the statutes passed acainst papal encroachments; and it was thourht expedient to remove such doubt lyy 11 and 12 Vint. c. loS. which anthorises her Majesty to enter into diplomatic relations. provided that no person in luly orders in the Chureh of Rome, or besnit, or meinber of any other religions order, commmity, or society of that church, bound by monastic or religious vows, shall be received as ambassador at the court of London. Ambas. sadors are not subject to the municipal laws of the states in which they reside, the theory being that they represent the persons of their respective masters, who canoot be smloject to any other laws than those of their own country. If an ambassalor offents against the monicipal law, or aboses his character, he may lee seut loone, and accused bofore his master. Though there was much donlt on the point, this rule seems to extend to crimes arainst
 as to crimes artitiolly created liy the poliey of the particnlar state. muld prohibitu; and it is uow said that the ease of bon l'antaleon sa, the lirather and swervary of the l'ortuguese amlassador, who was excented for an atrocions muder during the pros tecturate of fromwell in l6.5t, was no excention, as he was not joined with his lrother in the same commission,' She Ampassamor, Embassy. The arrancement of international ceremomies helongs ta the subject of diplomacy. To treat it in detail would lead us far beyond onv limits, and we must eontent ourselves with remarking a few of the custumary and conventional monlitications which atlect the general pmojule if international law lyy which all imblemulent states are held to be -qual.
homol honoms are enjowed by the empires and Kingitons of Eurone inclating the Swiss Confetera. tion, the grand duchies of tremany, anl, ammest Catholie states, ly the pope; and the same right exteuds th the Cinitel states of Amorica, 'Theses. along withother rights of greater importance, inelous the right of takinis precelence of the whers in all internatimal ceremminals. Amongst those who -njoy myal homours, the order of arecedency, after much discussion, was left hy the Comyress of Vienna on the ancient fonting of chstom merely. The rule thos dixed is sail to be the following: Monarehs enjoying royal honoms, lut not crowned heads. yielil incedince to those who are, whilst they enjoy it wer all cther monarehs, lemi-sovereigns. and rulers of dependmit states. This rule leaves the relative rank of the crowned heats and other classes amongst themselves undetermined, and a curious expedient has lieen fomm for olviating the neressity of a minuter elassitication. By what is called the oflomut, the rank and places of the varions powers are changed from time to time in a certain irler returmind by lot. If there are several parties to a treaty, for example, a correspmoling munber of copies is made of it, the name of each state leing nameal first in the cony which it preserves, and the wthers in the oriler determined hy the elfornet. But the rinht to alternation has sometimes heen a sulijeet of contention. In 1742, it was refused to Prussia loy Creat Britain; rud Humary and sardinia hal great diffeculty in obtainine it it the peace of Aix-lachapelle.

The subject of maritime ceremonies will he treatol muler its respective hemes. Thuy eonsist of sahntus fithor with camm, on with the flas or pendant, hy furling it, lowering it, or pulling it down. DIPSOMANIA, or OINONANIA, fiom the Greeti words lipsa, thirst, or oinos, wine, and mania -terms of modern invention, to denote an irersistible or jnsane eraving for alcobolic stimulanta, when ocenrring in a habitual or confirmed form, and requiring confinement or restraint of the ferson for its cure. Duch discussion has taken place in regard to this and other forms of what is often called Noral Insanity; the most recent views of physicians, however, tend to shew that the crinking insanity, or fioror bibendi, as it was called by an early writer on the subject, is often associated with other forms of mental derangement, and is very apt to be, in connection with one or more of these forms, hereditarily transmitted, even throurh several generations ; so that the really physical or insane character of the craving for stimulants, at least in some cases, may be recrarded as a well-established fact in merlicine. The legal and general questions in counection with this subject will be discussed muder the heads of Insanity and letemperinice.

DIPTEIRA (Gr. two-winged), an order of insects, which received from Aristotle the name it still bears. Its distinguishing characters are so olvimus that it has heen acknowlelged, with little change of its limits, by almost all naturalists. Fly is a popular name very generally applied to dipterons insects, and often with some distinguishing juefix (as Monse-1ly, Flesh-fly, Blow-fly, Bot-1ty, Crane-fly, \&c.), although it is sometimes used with such pretix to designate insects not belonging to this order (Dragon-fy, Day fly, May-fly, Ee.). Nideres, gnats, anel mosquitoes are also dipiterons insects. In the number of species Which it contains, this is one of the most extensive orders of insects: some of the species are also remarkable for the immense multitudes in which they appear : aud although most of them are of small size, and few attract us by brilliant hues, not a few are important on acconnt of the anmoyance or mischief which they canse, either in their purfect or is their larva state; whilst many of their larvie (magrots) are also very usefnl in consuming patrescent animal matter. whicle might otherwise prove a source of pestilence.

The D. have unly two winas, which are momliranous and simply veined. I Jittle lehind the wings are tro small slember organs called I/altere, prisers or halanous, the use of which is not whll known. They are nsually present even in thuse exceptional insects of this orker in which the wings are not developed. 'I'he hear of the 3 . is fermerally in great part occupied ly the lage compuond "yes, which often contain thonsamds wi facettes; and lesides these, tlowe siuble or atommatic eycs (ocelli) are often also present, flacen unan the crown of the heal. The month is firmed exilnsively for suction. amb is usually farnishad with a short mombranmas suctorial proboscis, romI"senl of parts which represent, although so differmatly monlibial, the portions of the month in enleontomons and other mastioating insects, some of the Ints, huwever, witen blisapraring. The probnseis of many is capozhle of pioreiner the skims of anmals an the juines of which they feed; others are puite destitnte of this p"wer of piereing. Many feml -hafly on sulechame and rither varetalle juices. Ho sone remera, tha jermet insect semms restitnte of it mouth; and the term of life, after the perinct state has bern attanem, very inine in sombe, aprears to be briaf in all. 'The porar which many dipterons

 wathe felmiliat te wory ane: in the exomple of the

 with dions for the formation of a vecum, has been
called in question, lut mothing satistuctory has been sulstitnted for it. 'The terminal rings of the abblumen in the females of many species, form an ovipositor capalile of prexcing the sulbstances in which the egos are to be laid, amd composed of pieces which may be exserted or retracted into one another like those of a telescope. 'I'he eggs are very generally deposited in matrescent animal substances, but those of some kinds in the bodies of living animals, some in vegetalje substances; the larre of some live in water; the eggs of a few are hatched within their own bodies, and the larve of some even remain there till they pass into the jupa state. All the D. matergo a complete metamorphosis. Their harva are destitute of true fect, altbough some of them have organs which serve for the same pmonose; some have a listinct hearl; but others have the heal soft and changeable in form, capable of being retracted into the Porly, and distimgnishable only by its mosition, and by the organs of the month. I'hose which dwell in water or in thinl putrescent matters, have a retractile tall-Jike prolongation uf the hody, teminated hy a matiated expansion, which commanicates with air-tubes, and constitntes part of a very remarkable respiratory system. The larve of sume I. spun cocoons when about to pass into the pupa state: but in others, the skin of the larva hardens and encases the pura; the periect insurt fimally making its escape hy foreing ofl with its head the end of its pupa case.

DIPTERA'CEAE, or DIPTEROCARPACE.E, a matural order of exogenous l hants, consisting of $^{\text {ha }}$ beantifur and majestic trees, batives of the East Indies. Some trees of this orker, of which about fifty species are known, are highly valuable as timbertrees. Smong them is the SiL (q. v.), the nost esteemed timber-tree of India. They abound also in balsamic resin, and their resinons products are used for a varicty of purposes. See Arome, Cidre finder, Copal, Dhmieh, I'ing Vainisif, and Sal. -Dipterocorputs, the genns from which the above order las received its name, cuntains several species of the moblest trees of Imlia. They abound in the warm parts of the east coast of the Bay of liengal amd the Eastern Ieninsula. The wood is used for house-buildines, ship-builuling, \&c. D. turbinatus, the Gutriun or Goordun Tree, the species by which the genus first became known, often attains a heiglat of upwards of 200 feet, and a rirth of 15 feet. It has a pale-gray tronk, rising without a brand till it forms at its summit a small symmetrical crown. The leaves are hroal, slossy, and beautiful; the thowers in white racemes, but not conspinnons. 'low wouk is hamb, chose-gramed, and durnhle. A frourant oil exnles from the trunk, which is watremely valualle for pitel and varnish, and is alse nsed medicinally. It is procured loy cutting trans. verse lules in the trank, printing fownwards, and lightine dires in thom, which causes the oil to How. The trae is sumetimes called the Woon-aIL "limise 'llais vil ur lalsam is also proeured from other spreies of Hiphtrucarpus. 1). (rinerves yidids a resin which is valualole for phasters, and acts on the mutous memarames like Jalsam of Copatio. 'l'he davanese sme:r" bamana leaves with this desin, which then burn ats tonches, with a pleasant odour amal white light.
 pronliar to tha ohd ral simmstane, in which two spereme have beat fombl. They derive their name from thenr mand strikins characteristic- the donble anal ami rlorsal lins, which ate opposito to each othor. 'llur luat is large and llattenoel, the teeth submusal, the soiales partorated ly small foramina, and the tail heterucereal.

DI'PTYCII (Gre diptuht ), a domble writine-tablet, or two writing-tahlets, which conld ler folded together. Herodotas speaks of surh a tahlet, made of wood and covered with wax. It was in the later Roman time, howerer, that they were most used, and those which have been presserved belones chiolly to the perion when classical was moreing into medicyal life. 'The beantiful carvin' with which they are often covered on the outside, conserpently represents not unfrequently a combination of classical and of Christian sabjects. lvory and metal were sometimes employed in phace of wond; hat the construction was always the same the wax with the writing being in the inside. Under the empers, diptychs were distinguished into consular and ecclesiastical. The former, which were presented by the consuls and other magistrates to their friends, and those officially comectel with them, on their cutrance on office, were inseribed with their names, and bore their portraits. The ecelesiastical diptychs, on the other hand, are decoratel with scenes from sacred history, anl were preserved in the churches as part of the sacred ornaments. Those that exist are of rarious sizes, rarcly excceding eight iuches by four.

Di'PUS. See Jerbol.

## Direct. Sce Collaterai.

DIRECT ANd IRE'TROGRADE. In Astromomy, the motion of a planet is said to be direct when the planet gocs forward by its proper motion in the zodiac according to the succession or order of the signs (i.e., from west to east), or when it appears to do so to an observer. Un the other hami, it is said to be retrograde when it appears to go the contrary way.

DIRE'CTOR, one of a number of persons appointed to conduct the allairs of joint-stock uudertakings, such as lanks, railways, water and gas companies, tire and life assurance companies, and various kinds of manufacturing avel tradind concerns. The office of a director is in all cases one of less or more responsibility, sometimes of considerable risk, and according to commercial maxim, ought not to be accepted lightly or for the mere homour which is supposed to be incidental to the position. On this point, mufortunately, there is mot a little loose morality and want of flue consideration. Nen are seen to enter on the office with scarcely a thonght of attembing to their duty, or of the mijury they may inflict by allowing their names to be attached to undertakings in the management of which they cannot be said to take any particular interest. Latterly, so many instances have occurred of the perfunctory performance of the duties of directors, greatly to the damage of those who confided in them, that, perhaps, new and more wholesome views may arise on the suljoct. As a member of a body incorporated by the legislature, a railway director is bound to administer the affans of the company only with the means legitmately put at his disposal, nor can he be expected to incur any personal liability to sustain the general operations. Usually, however, when there is any temporary or preuliar shortcoming in the fimances, the directors overdraw to a cortain extent the company's lank accomen on their personal responsibility ; in all such cases, and where the ontliy has been justitiahle, the shareholders rarcly dechne to authorise measures which will relieve the directors of their obligations. In the case of banks, there are usually two kinds of directors-the mdinary and the extraordinary. The ordinary directors are practically the conductors of the undertaking, while the extraorlinary attend only on particular occasions, and are, in fact, little else than ornamental appendages, whose names impart a
degere uf distandian th the eonerm. As regards lamk as well as railway directors, it is the rule that they mast rexpectarely possess in cortain imonat of stexk. It is an maderataming that the directors of ralways, banks, and assurance companios, should he paid in some way for their sorvices. bown mostly men in hasiness, thay camont los expected to pive away their time and take tromble for mothang. Their fayment, laweser, in the shape of an homorarium, is pendrally trilling in comparism the amoment of falmur which is to be caromateret. At medtings of sharelolders, small sums are votel to be set asside for the directors, which sums are for the most piart apmoniated in the ration of attendance. The fee of a bank dircetor is not unasually hali a gninea at cach mecting: though it is as customary for those prosent to divide amonest them the sum set apart for the oceasion, wherefore the regular attembery get most. She insigniticance of these fees, erm where no stingmess prevails, is employm as an argmont why anything like a serupulous examination into affars is not reasonably to be expected-an arqument semmingly of no great moral or lecral force; for it is clear there can be no valid excuse for neglecting a trust which has been volmentarily aceepted.
The difficult questions as to the cases in which directors incur liahility for the losses sustained hy the shareholders whose affairs they have mulertiken to manage, which are now (1561) occupring so much of the attention of the comrts and the mblic, will be discusserl under the head of ladbility. Of the statutory provisions as to directors containal in the Joint-stoct Companies Acts (the principal act is 19 amd 20 Vict. c. d7), the chict are these-1. That the first directors shiall he selected, and their mumber determined, by the subscribers of the oricinal memorantum of association, who shall themselves loe deemed directors until other directors are appointed. 2. That his ottice of director shall be vacated by the acceptance of any other office or place of protit under the company, by bankruptey w insolvency, or by being concerned in any contract with the company, 3 At the first ordinary mecting after the incorporation of the company, the whole of the directors shall retire from office; and at the first ordinary meeting in every subseqnent year, methind of the directors for the time being. or if their number is not a nultiple of three, then the number nearest to one-thind, shall retire from alfice. In every snlsequent $y$ ear, cobe-thinl, or other nearest number, who have been lonatot in uffice, shall retire. A retiring director shall be re-eligible. 4. The comprny in a general meeting may inerease or diminish the number uf directors. 5. Any casual vacancy oceurrimy in the loard of directors may le filled up by the drectors: hut any person so chosen shall retain his oftice so long only as the vacatmer director would have retaned the same if no racancy had oceurred. 'The company, in general moeting, may remove any directur, and appoint another in his stearl. 6. The directors may meet together for the dispatch of Lusiness, adjomrn, and otherwise regulate their meetings as they think fit, and determine the quorum necussary for the transaction of lusinuss. 7. Questions arising are determined by a majority of rotes, the charman having a casting vote in case of cquality. 8. A director may at any time summon a mecting of directors. 9. The directors elect their own chairman, aml determine the period of his office. To case no chairman has been appointed, or he is absent, the directors shall appoint one of their mumber to preside for that time only. 10. Directors may delegate their lwwers to committees of sich number as they may judge expedient. 11. The directors must cause minutes to be made in hooks
providel for the purpose. These minutes shall set comld not be reconsolidated ly the fag-enits of the fortly all admointments of officers male by the airectors, the names of the directors present at each mecting of directors or of committer, all orters made by meetings or committees, and all resolutions and other proceedings of these lomlies. These mimutes shall be signed by the chamman, and shall he receivable in evidence of what tork phace without any further proof. 12. The tirectors, with the sanction of the comprow in a geneal meeting, may declare that a divinend shall be pail to the sharehohlers in proportion to their shares. No dividend shall be payable "xcent ont of the pronts arisimet from the linsiness of the company. 13. If the directors shatl delare any divilemd when the company is known by them to be insolvent, or any divilend the prament of which world, to their linowledge, remper it insolvent, they shall be juntly and severally lialle for the delots of the company then existina and for all that shall be thereafter contracted, so long as they shall respectively remain in ciffice. It is prusiled that the amome for which they shall be su lialle shall not excend the amomet of the dividend declaren, and that if any of the director: were alsont at the time of making the dividend, of protested in writins, they shall be cxempted from liability. Before recommending at divilend, the directors may set axide a reserved fumb out of the profits of the company. In companies incorporated for carrying om molertakings of a pmblic nature, such as railways, the armointment, rotation, and powers of tirectors, are resulaterl ly the statute commonly called 'The Commanes Clauses Act,' S Vict. c. 16 (for Sentlant, c. 17). Two directors are sufficient to sign a contract, The directors lave the manarement and superintendene of the atlairs of the company, and may lawfully excreise all the pwours of the company, except such watters as are specially directed to be transacted by a atneral meetine of the conapany, Sce Llability (Limitel) Acts, Jonst-stock comidnife.
DHEECTORS. On the Nath of lmbespierre. in 1744 , a reaction commoneral in the ('onsention itself, as well as throughout all France, against the sanguinary excesses of the Terrorists. Eltimately a new constitution-that of the year $: 3$ ( 179.0 ) gave hirth to a new wowermment, compost of a Tegislative horly divided inte two comenis-the Conncil of Pive Inndred, whise function was th pronnse laws; and the Comeil of the Ancients, whose function was to pass them. The actual execntive power was motrustel to five mombras chosen from luth sections, ank whe sat at the Luxembourg. Their names were Lípeanx, Letour. newr, licwbel, liarrac, ame (amot. These dime constituted the fanoms firectory. 'They assumed authority in a moment of immerse feril. Jrance was +hicioned with gigantic alversarics. while distrust, disematent, and the malice of rival factions mate her internal ardministration almost hepeless. The frantio heroism of hur soldiers saved laer frome spuliation ly the forcigner; and hawl all the members of thas Divectory bern patrintio and homest. she might have loen saved also from sfuliation hy ber cown faldren. lint, on the contaras, the hame-

## DISCIPLINE—DISCOUNT.

the principles on which the lieformed Church of sontland was originally fomuded. It lays down rules for the election of 'lastors or ministers' by the conqregation, their exmination lyy 'the ministers and chers,' ge, also for the election of elfers and of leacons; it recognises the office of Superintemient (q. v.) as then established; lout it is most largely occupied with things pertrining to ecelesiastical discipline, strictly so called, and the mode of dealing with persons guilty of offences. The First look of Discipline never receivel the sanction of an act of parliament, but was sulscribed by many of the nobles and barons.

DISCIPLINE, Secont Jook of, or 'Heads and Conclusions of the Policy of the Kirk,' a document of great importance in the ecclesiastical history of Scotland, adopted by the General Assembly in 1578 ; and, although never ratified hy act of parlia. ment, still frequently appealed to as the most perfect and authoritative exhibition of Scottish Presbyterianism. The separations which have tabon pace from the Established Church in sontlant, have not been on the professed gromd of dislike to the constitution exhibited in the Secoul Book of Discipline, but of auxiety for its perfect maintenance; and this docnment has recentlybeen alopited as one of the articles of union among souttish Presbyterian cluurches in Anstralia. It was pepared with great care liy a committee of the Gencral Assembly, in which Aulrew Melville took a Jealing part: and in a time of much conflact letween the court and the church, concerning the 1 mwer of the civil govermment in things ecelesiastical, church government, anllatronare ( 1 . v.). It begins hy asserting strongly the powers regarden as essentially inherent in the chureh, sets forth the distinctions leetweer civil and ceclesiastical government and their mutual relations, and lays down a thorougly Preshyterian Hatform of churelegovermment.

IHSCIPLINE, in Naval and Dilitary matters, is a general name for the rules laid dona for the froper behaviour of the persons employed. The Matmy Act, the Artieles of War, amigeneral orlers ismed ly the Amiralty and the War Ollice, form collece tively the come liy which the riscipline is regulated. see Aeticles of Waf, Alutisy Aem.

In the army, resimental diseipline is chefly mam. tamed ly the arljutant. lle sees the regimental whers carried out; superintends the drill and hied movemonts; mapects and tells-oll all guarels, esconts, and parties; regulates all luty rosters, or rollsters : recives garison orders; keps regimental bowks The adjutant-general is to the whold army what tha anjutant is to a regment, in reference to discipline. In the nary, the diseiplime is necessamly wery striet.

DASCO'LOLI, accorling to Cusiur, is fanily of

Discobuli (Ligures. Montuymi): a, sucker, on a later seale.
madamitorms fishos, ramatide for having the ventrif line mitcal Lo form at sucking dise on the und $r$
surface of the body. To this family, also called ('yclopterider, belong the Lump-sucker (Cyclopterus lumpus), the unctrous sucker or sea-owl or cockpallle suail, and one or two other British fishes. T'o this family Cuvier also referred the limora ( $q . v$. ), alverting, however, to the different position of the sucking dise, ancl other important distinctions, on account of which a very different place in the system is now assigned to it. The use of the sncking dise, however, is much the same - that of attaching the animal to fixed substances, so that it may remain and oltain its food, where otherwise it would be swept away ly the current. The adhesive power of the sucker, in the larger slecimens of the limplish, remains after thath.

DI'SCORI, sounds which have no harmonical relation whatever: differing from Dissonauce (q. v.), which in masical language is applied to snunds that are in grammatically correct relation to each other, though not consonamt.

D'SCOUNT, the difference between a sum of money due at a future preriod and its present value; or the deduction mate from the amount of a debt that is paid before it is lue. It is usually ascertained -in the case of hills of exchange, promissory-notes, aml the like-loy subtracting from the principal amount its interest, calculated from the date of payment zutil the date when the amount is due; but this, although sanctioned by usage, leads to an excess of charge, the interest being thas adranced to the lender before it has actually acerued. True liserment is computen as follows: Supose that $工 100$ is adrancel for one year at, say ir per cent., the sum repayable at the end of the year in respect of this alvance will be $\pm 105$; therefore tl00 is the present value of £105 due a year hance; and from this conclusion it is casily deduced by propertion, that the value of $\pm 100$ due a year hence is $\pm \% 5,4 s$. $94 . d$. Hence the true disciment on $\mathbb{E} 100$ dhe in a year at 5
 for the present walue, 100 A

## $A m \cdot$

$100+0 r^{\prime}$; where ' $A$ ' is the pineipal sum due; ' $u$ ' the time, in years or fractions of a year; and ' $r$ ' the rate jer cent., simple interest bing assumed. For example, let it be required to find the discount (m) $49,7 s .60$, due seren months heuce, at $4!$ pu cent. Herc $A=心 .97,7 s .6 d=97 \because 35, n=9^{\top} \pi, r=41$; $m r=\frac{7}{12} \times \frac{4}{2}=\frac{68}{8}=\frac{21}{5}, \quad A m=97.375 \times \frac{9}{8}$.

$$
100+m=100+\frac{21}{5}=\frac{921}{3} 1 .
$$

1月SCUSSION, in Scotch Law, By the litw of scotham, all cantioners, unless bound jointly and severally with the principal debtor, were fomerly, and cantioners bound prior to the passing of the Noreantile Law Amendment Act (2ist Inly 1550) are still, entitled to insist that the creditor shall call on the principal debtor in the first phaes: or discuss him, as it is technically said. Where the principal debtor fails to satisfy the obligation in full, the ereditor was bound to give the cautioner the benefit of such portion of it as lie diul discharge. biscussion was not merely ac demand for parment, lont enforecment of it, in so far as the means of the principal debtor admitted of. Cantioners. bound sulsequently to the date of the Mercantile Law Amendment Act (19 and 20 Vict, c. 60, s. 6), cam enjoy the right of discussion only by express stipulation.

DISEASE, according to its literal constraction, a state of dis-atse, or absence of the combition of health, in which all the faculties and fighans of the body aml mind work together harmonionsly and without sensible disturbance. In a strictly scientidic sense, there may be discase withont pain or measiness in the orlinary meaning of these worls, but harily without functional disturbance or inctpacity of some kind. It is, therefure, only neerssary to inclucle in the definition of discase the dimmation of functional pwer, whether attemed or not by sulfering, and the scientific and practieal ideas of the warl will chasely correspome. It mast be admitted that slight structural and functional deviatious from the state of health are sumetimess monotied: lont only becanse they are slinht, ami because the functions to which they exten are not halitually in use to the full extent. A great deal of unuccessary obscurity is found, especially in continental witers, in discussing the alnstract inlea of disease, which has been connected with all the most intangible subtleties of the most abstruse and motaphysical philosophy, hy regardimy it as depemdent upon the inlea of life and of the vital toree. Many anthorities have thas generalised disuase into a separate active principle, opposel to, and everywhere seckins to destroy, the prineiple of health; and Paracelsus was hardly more open to objection on the ground of absurdity than many others of his combrymen, when, in his picturesque aml at the same time nystical manner, he endowed the vital principle with a kind of personality, and spoke of discase as due to the whims and eaprices of a displeased and resentful Archreus, an idea which was still further developed by Van Helmont. It is common to treat of disease as being functionul or organic, i. e., evidencel by ehanges of function or of structure; but function and stracture are so clos.ly allied in fact and in nature, that the more this distinction is exanined, the more vague and impalpable
it becoms, and it san therefore omly be kept up as a prasusinall and convintional :wram? The dassilicatan and arrammoment of dhsesoses tewordine to their external faracters hats been termed Nusulney ( $\mathrm{c} . \mathrm{v}$. ) : while the observation of their mone intmater ant less supuricial relatmons in comncetion with thair causes and resulte, is "abled
 being lert in view in the healing at on Modiane (1. . .) , of the mom zuactical Inertion of ohich they form the pillars.

DBbiAstes OF PLANTS form at subject of stanly meresting erparlly in its scientific aml its cernomic or paratical relatnons, but in sempal to the most impurtant parts of which murh otsemonty and whertanty still exist. Eumugh, indow, is known to shew that, as might have been expected, an analogy subsists between the kinkls of disease top which flants are suljecet and thuse of animals, buth in their nature and their causes, yet with wide niller. ences, according to the difference letween vegetable aml animal life. l'lants, hke animals, are lable to suller from unsuitalle external circunstances, as of temperature, dronght, or moisture, \&c.: they an liahle, like animals, to suffer fond deficiency of fomen, from excess of it, or from being compelled to sulsist on impromer kimls of it, or too exclusively on some particular kim. They often suffer much from venetable parasites, chictly fumg, and from multitudes of minnte anmals, which, withont eatimg them up, lestroy argans essential to their health, or prey uron their juices. The constitutions of plants are aceommodated to partionlar temperatures, and they meither flowrish when the temperature is for any considerable time mach above or much hetow certain limits, very diflerent, however, for dillerent species. liyht is of the greatest impurtance to vegetable life, and a want or deficiency of it spechly produces an unhealthy condition, the proper chemical changes not taking place in the juices of the plant; and this unhealthy condition, sometimen very extensively prohed in gloomy. seasons, when the deficiony of light is aceompanied wath excess uf nomisture both in the air and in the soil, rembers plants very lialde to the attacks both of vegetalide pravites and of minute animal trilus.

Excess of matriment, cansing an extreme rapaity of growth, sometimes proluces an minealthy rnidition in particular parts of pints, in which a greater amonnt of tissnc is develuper in a simple Seasom than can be thoronghly matned. - Mamine, injudicionsly aml unsuitably appied, are often productive of clisease. Putrescent matter emmaf in contact with the roots of many plants, is wry injurions to then, and causes centro. Cuntatinn, as a canse of disease in plants, if not fully demnstrated, is remperel highly probalile by such fants as the memorable mevalcince of the peitato di case, and the rapid spreml of the vine disease (undium); wur thes the existence of partionkr funci in the diseased plants materially anlect this ponnability,

With regard to the diseases of plants semerally, little has lncon hitherto fond practicalle in the way of cure, and preventinn is the ulject chietly abmed at in all investigations of their mature and canses.
some if the most important diseases of phants are noticel under fraticular donls; and some of the most destrnctive parasitic fungi are described in their proper places in this work.

DHSHONOUR OF A DILL. When the drawee, or purson on whom a bull is drawn, declines tu areeps it or to pay it. he is said to dishonome it. The act of drawing or of indorsing a bill implies an obligation to pay it in the last instance, and the

## DISINFECTANTS-DISLOCATION.

person in whase facom it is drawn has thas reconmse against the drawer and indorsers, shanld the drawee finl to acout on to prys. In order to preserve this recourse. however, it is indisumsable that notice of fishononr shall he siven th the drawer and mulorsers. No particular fom of notree is requisite. The notice must he such as to inlentify the linl, and to infom tlre party to whom it is given of the protest, a copry uf which wurht to accompany it. If the nutice is pint into the post-oftice, and properly admeessed, it is sutheient; and even rerbal notice, if elear, will suffice. In the case of foreign linls, the piorion within which notice must he givm is regulated ly the usages and custons of merchants. Any delay which can fairly he ascrihad to neerlect or amission. and is mot justified loy the circumstances of the cise, will he fatal to the hill-hwleler's claim for reconrse. In inland hills and notes, the rale till lately in seotland was, that fontecn days after the protest was taken should le allowed. This has heen altered by the Mercantile Law Amendment Act (19 and 20) Tict. c. 6(1) which proviles (s. 14) that netice of thishmon of inlamblyms and fromissorynotes, in rivler to entitle the holipr to recourse, shall he given in the same manner and within the same time as is requiret in the case of foreion bills ly the lew of Scotland.' 'To hoth classes of lills, then, the English rule is now applicable, which is, that notice must, in the general case, he sent the noxt day, where the parties reside in the same place, and by the next prost. if they resile at a distance.

DISINFECTANTS are a class of smbatances wheh have the power of alosorhing of destroying the ottluvia "I fetid olours erolverl rom putrescent matter and the miasmatic matter goncrated in luw. mashy, and ill-drantul lucalities. The principal substances capable of being used for this parpuse are chlome, bleaching powter, animal charcoal, veretable (wood) charemal, chlorinte of zinc, sesfuicliforide of irun. nitrate of leal, aw atate of lead. and pitrous acid. C'lolome (4.v.) cither when usetl ley itself, or in combination with lime, as bleachingpowder, is probably the most purerful disinfocting arent. When liberated into an aproment. it immeMately canses the clestruction of infections or wher Teleterioms matters. The moke of its action appoars to be pramibally due to the wrat allinity of chlorine for the hydrugen of the exteons compunnuls evolver frem patrefyins mattor, aml in abstracting the hyonogen, the chatorine atostroys the organic substaner. it simple way of emploging "hbume ns a djsintecting agent in sick-poms, ams atjacent lobloes amd apartments, is to place a thin layer of hleaching ]owder mon a plate, froms whicla the carbmic acit of the air will liborate fhlorine rapiolly enomes to lee of essemal serviee in keregner shwn infection, and withont cansine any incomvamence to the immates. Sce Maxganese,

IHSLOCA'TION consists in the displacement of one lume from another with which it forms a joint (fut out of joint heinc the popular expression). Disbeations are gromally the resnlt of sudelen accident, but may be the result of tisease. or may be congenital. The displacement may be partial or comMlete; anl surgenns classify then cases into simple disloations, when the skin remains mbroken, and compomel, when there is a womm ly which the external air may commonicate with the joint. Oecasiomally, in adilition to the dislocation, there are fractures of the lumes, or lacerations of important blool-vessels in the neishlomurbond; it is then temmed a complicated dislocation. Dislocation is a rare accident in infancy and akl age, becanse in the former the joint-ents of the hones are very thexible, and vield to violmee; while the aged skeleton is so rigid that the brittle lomes fracture moler force that wonh Trive yomger and fimer ones out of their sockets. Dislacations are most frequont betwem the ages of thinty and sixty. I'resons with weak muscles, and lax. long ligaments, or those in whom the latter have lwen suftemed hy inflamnation uf the joint, are predispused to disloe:ation. The joints most frequently displaced are the shualder aml the ellow.
benoral simmpoms of a dintacution.-Aiter a hlow, fall. or violent musenlar exertion, a limb is foumd to le immovalile at the injured joint, there is great pain, ant the shape of the part is changed; hot som swolling ensues, and every distinctive mark abont it is obscured. If left alone, or merely treated as an inflamerl joint, the swelling cradually sulusides; hut the immobility contimus, the limb is crippled for montlis or years, when at last nature forms a new socket for the che of the bonce anel some amount of useful motion is restured. The proper shape of the part is never restored, lont remains an eyesore to the 1bitint, shil a disurace to the surgenn.

Clove-hitch. fantemint this is tor roll a banlacu, wetterl, to provontshyminer, monnd them limho, :and than takins the thine wath which le wishes to oxtend in futh lands, lus easts it juta two loups, forming what is ralleal al clowe-hitrh, and therit shijes the druble noose ul the limh thl it rests an the wet
bandage previonsly applied. In ohd-standing eases, the hands grow weary lefore the extinsion has bron kept up sufficiently loner, so it is well to aclapt pulleys to draw upon the elove-hiteh, as with then the traction can be resulated as the sureseon desimes. sumbur, forcible pmllime is usuless and hurtful, tin. object being merely to tire ont the museles which rosist the attempts at reluction; whene they are exhaustel, the beme will gremerally slip lanek into its blace with an andible suat?

A class of shrewd indivinlmals, callent "tmonssftors, frequently aterive pontit from some conditions of juints which resemble dishocations. Chronic rhenmatic indammation is ocensionally known to fix itself ly an aeciclent on some particular joint, expecially the shombler or hip, amd may so elante the surfaces of the bone-ends that thay are spontio. nownsly dislocated; the empirir, naturally antacomistic to the regular practitioner, tolls the patient that when he met with the aceilent the dislocation ocenred, lont that his moctor overloked it. Again, many persons who have injured their joints do not sulmit to having them mused alont, atter the first indammation has smbsted. The lume-setter gives a forcible bend to the limh, which breaks up the adhesions: and becanse he has dome roughly what the dactor would have done erbally well geatly, the patient praises him, while he hames the one who guiled his joint in safety throngl the first effects of the aceident.

Whenever a dislocation necurs, the nearest medical man shoukd le smmonem, even shombd the more displacement he rectified at once, beanse no stheh aceilent can neeur withont some tearines of the suft parts, and it will depend on the after-treatment whether the jaint will ever hecome useful again or not. It must also he rememberen, that the sooner a dislocation is redned, the easier is the reduetion. Since the introluction of anosthesia. however, and the subutaneons division of tissus, many ancient casses may be improsed, and many cripipled limbs restared to usefulness.

DSSLOCATION, D FAUI'T, a term used in Gacology to charanterise certain dispatemmats common among stratified robes. The arebey that rised these rocks almue the waters of the sea, producel in the elevation numerus rents. In their simplest fomm, the rents are nowe eracks, the parts, thouch seprated, romaining contignoms ; sometimes it greater or less fissure intervenes between the
disumitell furtious, and this is lilloll with matorials

 ond shle of the tissme wo atack ato mathy feet, or

 than they are on the somblum side. Tha fissure
 more than : 0 yarde in others: it is tillerl whth mand stome. In the lalinluargh enal fillo, tha ervatest

 nortle tor sonth lew 10 in loreaith, has chictly in Vircinia, lout pritly in North Carolina. In the enntre is Lakn lommonnl, coverine ahont six sifure miles. Elsewhere the surfaer is livided letwren tanered seods and heary timber, with a thick maturerowhl. This extensive morass has been, at a vast eust, fraversed lengthwise by a raual, which
conmects New Lebanon, in North Carolina, with Norfolls, in Virgima.

DISMA'NTLE is the operation which a ship unelergoes when to be laid up in ordinary, or placed out of service. She is unriyged; the yards and most of the ropes are removed; and the upper masts taken down.

DI'SMAS, ST, the name which Catholic tradition has attached to the 'good thief.' He is represented with a cross beside him.
Disórderly house. See Netsance, Moral.

DISPA'RT, in Gunnery, is a mark set upn the muzzle of a gun, to ail the grnner in oltaining a lme of sight truly parallel with the axis of the bore. The dispart, in strictness, is not the mark itself, but a distance or quantity denoted ly the mark; and 'to dispart' a gun is to determine this distance. It depends mainly on the relation between the dimmeter of the breech and that of the mazzle.

DISPEASATION, a licence granted by the pope for that which is ordinarily pronilited. The nature and limits of the dispensing power have been the subject of much discussion not only in controversy with Protestants, hut among Fuman Catholics themselves. It is held by the extreme alvocates of papal nower, that the pope may dispense in any divine law, except the articles of fanth; hy others, that his dispensing power does not extend to express precepts of the New Testament: some say that his dispensation is valil only When it proceeds upon just eause; some, that it is not iroperly a relaxation of the law's obligation, but merely a declaration that in the garticular case the law is not applicalle. The usage of the Church of Rome, however, agrees with the ppinions of her theologians in making the pope supreme in releasing from oaths and vows; and a deerce of the Council of Trent anathematises all who deny the power of the chureh to grant dispensations for marriages within the prohibited degrees of the Mosaic law; whilst the multiplied pohibitel degrees of the canon law give much occasion for the more frequent exercise of the same prower.-Nothing really of the nature of a dispensation is known in any Protestant churcl. The only lind of dispensations now in use in Eugland, are those granted by a bishop to a cleryman, to enable him to hold more hemefices than one, or to absent himself from his parish. Finmerly, the pope's dispensations in England, as elsewhere, presailed aqainst the law of the limel, but in ecelesiastical matters only, but in all that large department of civil affairs which, ly an inturested tiction, was brought within the seope of coclesiastical gremment. This ahuse was swopt away at the lieformation, by 25 IIenry V111. c. 21. The power of the pupe was then conferres on the Archbishop of Canterbury, in so far as it was nert contrary to the law of (ind. "lhe granting of suecial luences of marriage, and the like, is the only form in which it is cuer exerciscel.

In firmer times, the crown chamed a dispeusines finwer in civil, similar to that which loclonged to the perpe in ecclesiastical mattors. The jower was grossly abused hy James 11., and was consequently expressly abolisherl by the bill of Rights. The prvileg of granting rarlons in capital cases is the only form in which the dispensing power of the crown still exists.

DASPRUSION. Orlimary white light is hateropenems in its charactor, being composed of rays of Wharent reframability, and the torm dispersim is usen in ondics to donate the separation of these
rays by refraction. Transparent merlia of various kinds possess different dispersive powers. or, in other worls, different powers of winening the angle between the red and violet rays, when a ray of white light suflers refraction through a prism of given angle at a miven angle of incidence. The circum. stance called the 'irrationality of dispersion,' consists in the fact. that when a spectrum is measured after Frauenhofer's manner, it is found that the distance between any of the same two fixed lines of the spectrum has not a constant ratio to the distance between the extreme tixed lines, where different metia are used. See Srectrm. It may be noticed that the word dispersion is also sometimes used to denote in Opities irregular reflection or the seattering of light on imperfectly polished surfaces. See Catortrics. The amonnt of light not reflected according to the regular law varies with the nature of the reflecting suriace. In the case of light incident at right angles upon a surface of common glass, $\frac{1}{13}$ only is properly retlected. In perpendicular reflection at an ordinary silverel looking-glass, about $\frac{1}{3}$ is lost lyy this sort of rispersion. A little less than $\frac{1}{3}$ is lost in perpendicular reflection from highly polished speculum metal.

DISPLAY'ED, in heraldic usage, means expanded; as an eagle displayed, or what is vulgarly known as a spread eagle. Siee Eagle.

DISPOSITTION, in Art, differs from composition, inasmuch as the former has reference to the arrangement of the parts, the latter to the effect of the whole.
DISPOSITION, in Music, a term now used in organ-building, adoptel from the German, meaning the arrangement and combination of the stopson the different rows of keys and pedals, with the pitch of each stop, or length of the lowest CC pipe.

DISPOSITION, in the Law of Scotland, is a deed of conveyance, applicalle either to heritable or movable property, but most frequently used for the purpose of transferring the former from the seller to the buyer. There is another well-known form of the deed, the object of which is to settle a whole snecession. hoth heritable and movable, a will or testament, in Scotland, being applicable only to movable property. This latter deed is commonly known as a disposition and scttlement. The following are the clanses usually contained in a disposition for the purpose of conveying heritable property: 1. The nurrative or inductive clanse, in which the names of the disponer anil disponee are set forth. the canse of granting the ded is stated, and the recejpt of the price or consideration is acknowledged, if the ennveyance has been for an onerous canse. $\because$ The disponsitive clanse, in which the maker of the leed 'sells and dispones,' or 'gives, grants, and dispones,' if there has heen no price pail or consileraton given. 3. A clause dhliging the disponer tu) infeft. Sice Infermmerr. 4. A procuratory of liesignation (q. v.). 5 . 1 chanse of Warandice ( $q$. $\mathbf{v}$ ). 6. An assigmetion to the tithedreds and rents of the subjuct. 7 . An obligation to free the disponee from pulidic buritus due before his tirm of entry. 8. A clause to the effect that the title-deeds lave been deliverell to the disponce. A. A clause of registration. 10. A procept of Susin" (I, v.). And lastly, a Trsting ("lauss (q. v.), in which the deel is authenticatod in the nsual manmer. 'Though it is still "ptional to make usi" of these clanses, they have bewn gratly shartenod ly the Act 10 and If Viet. C. 45 ( 1.47 ), amb sume are antirely dispused with by the 'lithes tu Lands Act. $\because$ and 오 Viet. e. 76 (isoss). A dispusition for the conveyance of move ahbes is a mon simpler dochment. It often bears reference to an iusentory containing a more particular
emumeration of the effects conveyed. It grants pwer to the disponer to take ${ }^{\text {wisserssion }}$ of the subjects, and it also contains clanses of warrambioe amd registration, amd a tusting clanse. 'The dospusition and settlement, agaila, varies in forn wemelat to the nature of the property converyen, and tha arrangements which are male with reference to it. Sometimes it is a direct eonmyaner in wher eases it conveys the property to trusters, to be leche amd alministered by them for the homedit of other parties. In this latter case, it is known ly the name of a trust-disposition and settement. Where contingencies whiel cannot be foreseen with certanty are anticipated, where the managmont is complicated by details, or where the (Incrations muler the deed are likely to be protracted, the apointment of tristees (see Trevst) is usually resorted to. In either ease, the granter's life-interest in the projerty is reserved by a special clanse, and there is alsis a elause dispensing with delivery, An excellent furm, for the guidance of the practitioner in the preparation of this deed, will be found in the Juridical sityles (rol. ii. p. 442, od ed.). A clisposition in speurity which correspomds to the English mortgage, will lie explained under Heritable Brcuritifs.

DISRAE'LI, Isace, D.C.i., a well-known English muthor, was the descendant of a Hebrew fimily which flourished dirst in Spain, and afterwarls in 1taly. His father, Lenjamin D'lsracli, came to England in 1748, entered into lmsiness in Lemdon, amassed a fortune while yet in middle life, ami retiring to Eufield, there dicd in 1817, ased 90. IIs son Isaac, born at Enfield in 1766, was cilueated at Amsterdan and Leyden. Ile commenced his career as a port and novelist; Int, after the pullicintion of the tirst volume of his cumbuities of Literoture (1791), he discovered that his forte lay not in creative literature, but in the illustration of history and literary character, and to this he devoted himself. His style is elegant and pleasing, presenting the fruits of antiquarian research and study withont their dryness and general want of connection. No writer is more instructively amusing or amusingly instructive than he. Lord Byron speaks of him as 'that most entertaining and searching writer.' 1 . died in 1845.
D.'s prineipal works are the C'urimitios of Litrathre ( $1791-1823$; wew ehtion, with Life, Lomd. 1851): A Dissertetion on Ancetutes (1793): Essay on the Manners and Gmius of the Literary Charactor ( 1795 , Ith ed., 1850): Inquiry into the Litcrary and Political Character of King James I. (1816): Commentaries on the Lite and Reign of Charls $i$. (152s-1831); Eliot, Hampden, and Pym (18:2); Amenities of Literature (1541)-for which he received from the university of $O x$ ford the hmour of D.C.L.
disfaelit, Benjamix, The Pight How., author and statesman, ehlest son of the preceding, was born in London 1805 ; he reccived a private education, which was carefully superintended by his father. At the age when most other young men who rise to protitical distinction are sent to a miversity, he was articled to a solicitor, with a view of qualifying him for a sitnation in a government ollice which laad been obtained for him by his father. The drndgery of a lawyer's office being distasteful to him, he contributed to a Tory journal, the Represcntutire, which eame to an untincly eml. In 1827 , he published his novel I ivian Gery, which was sueceeded at intersals hy other brilliaut works of fiction, ineluding the Yomy. Duke, Conterini Fleming, The FIondrous Tule of Alroy, and Horrietta Temple. He also wrote the Rise of Istander, a Findication of the British
ronstitutiom, and the liowlutionury lipir, an "pice ridiculing roulutions, and whith was universally consilmed a failure. After visitine Italy and Crome, and extemling his favels to 'Tudsey amb syria, be

"iphes, whinh be declired to be "exactly the samo frimerples that he had always professed.' it is, frinas, necdless to state, that the nation at large has failod to alservo the consistency "I prinembe which 1). clains to have exhibited. He faiked t. carry lis clection ayainst Mr. Labonclure; and an unfrinelly allusion, in one of his election specches, to Mr Odimacll, hrought down upen him 6 maliciously humarns alhusion to his Ilebrew extrac. tion, and involvel lim in a hostile and belligerent correspumbence with a son of the lrish liberator. He again returned to his pen; lout in 18:7, his desire for a political eareer being mabatel, he was gratified by an insitation to contest Mail. stonc in the Conservative interest along with Mr Wyndham Lewis. He was eleeted, and at the age of $: 32$ took his seat in the Homse of Commons. Claming the attention of the House with undue precipitation, before he had sufficiently studied its temper, and exciting much laughter by an outre manner and extravagant gestures, he was so disconcerten, that he sat down almptly, hat not without notering the remankale prophecy: " lave begun many thmgs several times, and have ofton sueceeded at list. I shall sit down now, but the time will come when you will hear me:' In 1838, Mr W. Lewis died, ant in the following year D. marricel the relict of his late colleague. At the general election in IS41. he did not seek the suffrages of his former constituents, but oltained a seat for Shrewshmry. As the leader of the 'Young Englaml party:' he haul now gained the car of the llonse, amol he became at length the organ of the dissatisfaction with which the landed aristocracy and country gentry regarded sir liblert Pecl's relaxations if the system of protection to native industry. Ilis brilliant invective and pohished sarcasm inspired the Prutectionist party with fallacions hope and confidence. He denomeed the great tonservative, minister as the head of an 'organised bypocrisy' -as a great middleman who hamboozled one party, and plundered the other'-aml as a politician who 'haul fomm the Whigs hathing. and stolem their clothes.' Fortunately, howeser, such word-monserins cond not prevent the trimmph of a wise, salutary, and even imperatiocly required measure. In 1540, when l'eel nowed the abolition of the corn-laws. M., now M.P. for Bucks, in wain attempted to cuerthrow the measure. By his energy and cloquence, however, he savel the defent from becoming a rout, and formers the nuclens of a powerful ominsition. Un the death of Lord Gcory Bentinck in 1849,1 . succeeden to the leadership of the l'rotectionist luaty in the commons, and in the following year callesl the attention of parlament to the hurdens on had and the depression of the agricultural interust. He bore generous testimony to the political emsistency and prisate worth of his prodecessor in his Lurd George Bentinck, a Biograp,hy, which had an extended circulation. In 1532, the Earl of Werly, laving undertaken the construction of a cabinet, offered him the post of Chancellor of the Excherpuer. It was the first
time in luiltiant novelist had cever figured is the fimance minister of a great commercial state, amb it armes whll for the varsatility of his genins that he emerged with honour and credit from the urdeal. His secmul lmulget, in 185:, failen, howerer, to dind acceptance with the House of Commons, and the sumermment being outvond uma it, the Derby calinet ceasel to exint. 1). resumed the nulisputerl cadership of the pposition in the Lower Homse, from which he was asain summoned in 3855 , $t$, fill the post of Chancellor of the Exchequer in the second administration of the Earl of Derloy. In 1sis!, he introducert, on the part of the government, a measure of Parliamontary liform, which. beins thrown out, was fullowed lyy the resignatim of tire govermant. As a dobater, he excols in peramal invective and sarcasm. Since he has been in marliament. he has written Comingsinh, Syhil, and Therrel-uovels in which $p^{\text {olitics }}$ and fiction are curionsly but not msncuessfully mingled.

IHSRU'PTIOS, the name generally given in Scotlame to the famons act of 1843, by which upwards of 400 ministers of the Church of Scotland (nearly two-fifths of the whole) left their churches and manses to vimhicate prineiples which they concerved to he essential to the prity of that church, aml in hamony with its earlier history. The word Fhismption was pribinhly chosen to indicate that these ministers dil not lonk on their act as asecession or these nt. from the Clumel of sentland. lut as a split on flusion withim it, and the hody iwmediately after formed by them assmond the mame of the Free Church of Sootland.  with the , stablished chureh in the most essential doplomes, but dillior from it on some minor pint,

 Imbonthots, amb hapthets. The clam of the (lhmin of lame to lie raviarded as the cotholic

Church pevents its members from accepting the name dissenters, amb others selilom seck to andy it to them. On somewhat similar grourds, it is rejected loy Efiscophlions in scotland; and for very different reasme, to he found in the peculiar circumstances which attended their mrowth, the Methorliat (q. w.) churches are seltum ineluled in it, as on limarily used. See Establishel Cutrect, Nosconformits, Perithes, Secesion Cherch, Tolerition, \&e.
'The term bissenters is not strictly legal or ecclesinstical, those to whom it applies being usually described in legal language by a periphasis. It may le said to be a convenient term to designate thise Protestant denominations which have dissented frim the lnctrime and pactice of the church as by lia westahishorl. Immeliately after the lieformation, dissenters, or moncontormists, as they were then called, were sulijucted to severe restrictions and penalties. 'I uring the Rebellion, the laws against 1'ratestant sectariss were repealed; but they revived at the liestoration : and the parliament of Charles II. proceeded to coforce systematically, by new measmes of vigour, the princinde of universal conformity to the established church.' - Stephen's Com. iii. 53. By $]$ Will. and Mary, c. 18, the restrictions on dissenters were first relaxed, and certain denominations were sufferel to exercise their own religinus observances. From that period, varions statutes have been passed, each extending in some degree the free excrcise of religious opinion. At the present time, dissenters of all denominations are allowed to practise without restraint their own system of religions worship and discipline. They are cutiticel their nwn places of worship, and to mantain schools for instruction in their own opinions. They are also permitted, in their character as househmbers, to sit and rote in the parish restries. A dissenter, if a patron of a church, may also exercise his own judgment in appointing a clergyman of the Chureh of England to a vacant living. Fice on this sulject, Stej,hen's Eccles. Law.

A similar amome of religions liberty is enjoved in Scotland, not so much derived from or guarded ly special statute; fully recognised, however, by decisions of courts, as belonging to the law of the country.
Since the hegiming of the 1 Sth c ., the Presbyterian. Independme or Congregationalist, and Baptist denminations in Englami, have been associated unter the name of the There Denominetions. This asanciation was fulty organised in 1207 , and enjoys - he the Established clergy of Landon and the two dreat uniwesities the remarkable privilege of apmaching the savereigu on the throme. Totwithstambims much weaknes. arisins from doctrinal and otiner differemess, this associatom has contributed much to promote tol ration and religinus liberty in Enclame.

## DISTILLATION.

became almost exclusively employed for the classical epigram. The great poets of modern Germany, Goethe, Schiller, \&e, have also shewn a fondness for the distich, and remarkable skill in the use of it. A collection of moral maxims in Latim, ascriberl to a ecrtain Cato, Dionysins (q. v.), are called Distiche, and were highly popular during the middle ages.

DISTILLA'TION is au important process in the arts. It consists essentially in converting a limniul into vaponr in a close vessel, by means of leat, and then conveying the vapour into another enol vessel, where it is coulensed argain into a liguid. When applied to a solin, the process is called Sublimation. The ohject of distillation is to seprarate one enlstance from others with which it may lue mixed. In distillation proper, no chemical decomposition takes place; when any of the sul. stances are decomposed, it is ealled Destructrye Distillation ( $\mathrm{q} . \mathrm{v}$ ). The possibility of semaratimer substances ly raporising them depends upon the fact, that rery few substances are volatile at tho same temperature. Thas, water boils or becomes rapidly converted into vapour at $2 \underline{2}^{\circ}$, alcohol at 178. sulphuric ether at 948 , while oil of turpentine must be raised to $215^{2}$, and mereury to $662^{2}$; and some sulstances, again, are altogether ficed. By andyime the proper degree of heat, then, and no more, the more rolatile of two sulistances may be expelled from the less volatile; and suprosines the vapours of the two to rise mixed, as they are gralually cooled, that of the less volatile will he combensed hefore the other, thes affording another oportumity of separation.
It is often, however, not so easy to olbain a perfuctly pure product by distillation as might at first aplear, onving to another fact in chemistry-namely, that many bodies which, when pure, repuive a hish temperature to vaporise them, become more casily viporised when mixed with substances more volatile than thamselyes. ching to this, it is impossible to uldain, ly ilistillation alone, alcohol perfectly free from water. 'The eiremstance, on the other hand, is sometimes tumed to row? accoment in another way. Dy distillinis, for instanee, parts of Ilants with water, the essential oils pass over with the steam, and are then separated from the condensed wiater h y wher processees.

The applications of distillation are numerons both in chemistry and in the practical arts. J'ure water is olotained loy distillation, the most of the substances dissolved in natural waters beiner fixel. sea-water may thas be rendered drinkable, and there are apparatus for the special purpose. lint whorever there are cooking-utonsils, a distilling apmatus might he improvised. The pure watir that ilescomls from the elomls is prodnced in a way Which is just the process we are speakine of on a larire scale. See Dvaponatios. It is no figure of speceh to say that the dews are "distilled.'

The extraction of zinc from the ore is a distillation; thr metal, when reluced, passes orre in vipumr, and is condensed in a separate rossel. When the zine ore eontains calluium, this metal, beine more volatile, comes over in the dirst portions, amb may le removel. When meremry is usen to wextract parti"les of mold from sand, the mereury is "listilled of from the anmigam, leariny the gold, Whish is tixar. The mereny lering condensed, is acrain rearly for use.

The most extensive application of distillation is in tho mannfacture of intoxicating spirits, anel in melinary lanemare this is the most common use of Ilue word. Striclly kpakius, imbed, the surits are not pushered by the ate of elistillation; that is
 am rlistilation merely seprarates tho spirits from the
mixture in which they already exist. But it may be as well to give some account of the whole brocess under this head.

All the intoxicating drinks used in ancient times seem to have been the prodncts of fermentation merely. 'The art, as it has leen called, of evokius the fiery demon of drunkenness from his attemperef state in wine and beer, is a discosery of modern times. It is first mentioned by an Arabian physician of the llthe., Abulkasem, though the invention is attributed lyy some to the northern nations. 'The name aqua citce. given to distilled spinits by early flaysicians and alehemists, shews what an estimate they male of the discovery. Finymond Lully ' leclares this amimialle essence to be an cmanation of the Divinity, an clement newly revealed to man, but lifl from antiquity, hecanse the human race were then ton young to need this beverage, destinel to revive the anorics of modern dectepitude.' sadly hare these anticipations been behed!

Shirits were tirst distilled from wine, and hence called spirits of wine. An endless variety of substances are now used in this extensive manufacture Alcohol ( $1 . v$. ) is the essential ingredient of all spurits, and it results from the recomposition of sugar, which, by the process of fermentation, is resolved into earbonic acid and alcohol. Sugar, then, is the direct sonree of alcohol, and accordingly all regetaljle products containing sugar, such as grapes, the sugar-cane, sweet fruits, beet-root, \&c., may lee used in the manufacture of spirits. But there is another mome abundant vegetable snbstance -nancly, storch-which is casily convertible into sugar, and thus becomes indirectly a source of alcohol. In malt, and in germinating seeds gener. ally, there is foumd a substance called diustase (!.v.). If a small quantity of this or of an infnsion of malt, be added to a paste of starel, it will in a short time lecome thin and sweet, the whole of the starcl heing transformed into sugar. See lieer. It is thos that gram of all kinds, potatoes, and other sulstances which eontain little or no free sugar, are yet capable of yielding alcoholic spirits.

All substances, then, containing either sugar or stareh, or both, will yield spirits. With sugar, the mannfacture consists of two processes-fermentation and distillation. When starel is the original source, as is more commonly the case in the distilleries of this country, the first step is to eouvert it into shoar, ur tu sareharify it. This is the olject of what is technically called mushing, which eonsists in mixims the materials in a tritmated state with water at the temperature of about 160 . It is mostly from barley, oats, aml rye that spirits are manufactured: wheat is less usel, owing to its cost. liaw erain is sromm to meal; malt is only lousud. A certan froportion of malt is always used, wren in distilling from raw grain or potatoes, as the diastase of the malt is necessary to sat agring the saceliarine Ermontation, dfter lexime agitated for two or threr homes, the sacelarine infusion, called frort, is drawn off from the gruins, and eooled. To this wort is now alded a certain puantity of yoast or harm, Which inhuces the vinoms Jomantation, and resolves the sacehnine matter into alcohol and earbonic acid, accompaniod by a rise of tamperatme. The alenbolie mixture whinh results is cilled the wosh, ant is now robly for distillation. 'This takes place in an apparatus called a still, or Alembic (q.v.). In its oliler and simpler form, the still consists of a copper vessel, into which the wash is put. IThis vussl is providend with a elose head, terninating in it leent tulre, which passes, in a spiral form (the worm), throndl the refriseratory, filled with cold water. See sros. When heat is applied to tho still, tho spirit legins to rise in vapour at $176^{\circ}$,

## DISTILLATION-DISTRESS

along with nere or less stam; these vapones prass through the wom, burom combensid by the codd, and etrop or trickle in the fome of liguid into a recover. The promet of this tirst alistillation in a simple still is cathenl hom wines. This is then redistilled at a lower temperature in order to deprive it of part of the water ind of the fetiol oils that had jassed over with the alemol. 'Th obtain great purity and streneth, repeaterl distillation is usen.

A great improvement in distillinf was inventen in ISOL hy a Workman of Montpollier, of the name of Adam. By making the vapurs arisimy from the still pass throurh a surica of winting passarges, mambaned at a deteminate degrop of head, amb deposit part of their water and other inguratis, he was able to olstain from wine a spirit of aly refuired eleamess and strength at one oprotion. This pinciple has been alnited, hy listorins of Berlin (IS17), to the distillition of the cuasser washes of grain and other materials.

Alsolute or anhydrons Alcohol (q. v.) cannut be obtalined by distillation alone. Lecetified spinit, or spirit of wine, for buning in a lanp, still contans, whon of ordinary strencth, alont ${ }^{2} 5$ per cent. of water. Alcoles is considerally lighter than water, its specific gravity leing 703 (water, Iom). The strmper any spirit is, thon, the less will bo its specific gravity; and thus the strength of spirits may be ascertained by atn instrument which measures their specife gravity, the devontor (q.v.) or handrometer. The excise of (ireat Britain hus estaldished one degree of strength as the lecal standard, and this is called proft. Tlue specitic gravity of jroof-spirit is $\$ 186$, and it contains nearly equal weights of water and alcolnd.

If only alcohol and water passed wer in distillintion, all spixits, from whaterer extravel, would be the same; but this is not the ease. Brandy, which is distilled from wine, has a prendiar essential uil derived from the mape, and also snmo acil: rum is impregnated with an essential oil from the surarcanc, and with other impurities; malt liphor has the essential oil of burley, \&e. It is the se essential oils that give to the varions spirits their distinguishing havours. Some of the oils and other imputites are disargeahle and positively noxions; and it is one of the objents of rectiging to remove these. The mellowing effect of age un"m spinits is owing to the evaporation or spontanems deconposition of the "ssential oils. Newly distilled spirits are in womeral tiery, and specially untholesone.
sumar, when fermented, restlus itself into nearly equal weights of carbonic aciel and alcohol ; a pound of sugar, therefore, shonh vicld upwarels of half a pounil of prof-s ${ }^{\text {minit. The quantity of spirit }}$ atlorded by diflerent grains depemds unom the [rovportion of starel they contain: Jol jwands of starch is calculated to yichl 3.5 z"muls of alonhen, equal to nearly $S$ gallons of proof-sjinits. Of the various grains, wheat is the most pondective Taking the average of wheat. barley, rye. inats and maize, In0 pommels of com yield 40 pounds of spirit of specific gravity $942=: 37$ gallons profor.
distiller of malt whisky, says Dr Ure, calculates on olotaining two gallons of proof-syirits from oue bushel of malt in urdinary years. The highest yield is 20 gallons per quarter of 8 lashels.

The principal intuxicating heverages produced by distillation are: 1. Brandy (I. v.), which name is apphed properly unly to spirits distilleal from wine. 2. Rum is manufactured from molasses and wher uncrystallisable products of the sugar-eane. B. Corn or malt spirit, under the various names of British spirits, gin, whisky, \&e. The J huteh distillers give a peculiar flarour to their spirits (Ilollands) by
adding a portion of jmiper-berries to the ather ingrelients. From the lerench name of the juniper,

 quantry of spirit is distill in from patatom, whin centain ahout five per cont. of stareh. becet ront and carrots are also usel in the sanse way. Th: Swedes make a kind of spirit trom the saje of the lirrel, innd the mather and nther trees are torned to a similar acosuat. We have hesida, cherre
 (I. $x$.) is the Wast Indian nan" for all ardent spirity. nee spitars.
DISTLLAATION, DEstherove, is the tern applial to the process of heating veretable and animal substances in returts or similarly cluserd vessels, at a tomprature suflicient to decumpuse the original sulnstance, and oltain therefrom jrowhets bossessing wiffent rupurties from the material which yieldel then. Lamales of this process are, the heating of coal in gas-works at a red heat, when it resulves itself into colke, which is left in the retort, and cual-gas, haphtha, tar, 距, which histil over intos suitable receivers ; the treatment of enal at and below a low reel heat, when it yelels much gavalime oil ; the distillation of wood in close vissts at a red heat, when charoal is left in the vessel, and wool-vinegar, wool-spirit, tar, \&e., pass over in vapour, and are condensed; and the heating of bunes in similar retorts, when anmal chareabl is loft in the retort, and Dipipet's animal oil distils over.
HSTI'LLED WATPR is the condensed prondect mitained hy the distillation of water. All national waters, even rain-water, contain certain salline matters (common salt, \&e.) in a state of solution, from which they can only he cumpletely freen by the mocess of distillation. The characters of distilled water are, that it possesses a mawkish, insinid taste. without ondur or colomer, and when esamated toniryness in a vessel, it ought to leave no residne. The other jroperties of distilled water will le noticert under Whers.

DISTILLED WATEIS'S are alsained by distilling water along with the parts of plants containing essential olls. Rosewater and lavender-water are familiar examples.
DISTO RTION. The ruks of perspetive impuse certain eonditions in the delineation of natural whjects, and when the image formed by a lens on the focnsing screen of a camera ohscura does not fultil thuse conditions, it is subd to he disturted. 'Tho eflect of distortion is to render all straight lines, Which do not pass throngh the centre of the lens, curvilincar, and also so to alter the relative proportions of oljecets in the picture as to be opposed to the principles of true Jerspection. Pisturtion, in the camera olsonta, is smerally pulnced by the eccentrical incidunce of the oblinve pencils.

## I) ISTREI'N. See Distites.

DIsTREASA, in Enclish law, is the common-law remedy by which a man may remunerate limself for non- payment of reat or other daties, or may impound anotler's cattle trespassing upon his land. Distress is delined to be "the taking of a personal chattel out of the passession of the wrong-doer into the eustody of the party injured, to jrucure a satisfacting for the wrong committer.' - Stephen's Com. iii. 342. Distress is a remely of the fendal law. It was an Incilent ( 1 . v.) inseparable from the fealty to the lond; so tlat, 2s Lurd Coke lays down, a lord granting the rent to another, and retaining the fealty, the grantee of the rent could not distrein.-Co. Litt. 150 . Distress was incident to every service;
hence it mingt lue prat in force for failure to do suit in the lorl's court, or for not joyment of the daties awaded in a cond Jent. In modern days, elistress is practieally entoreal chicfly for nom-payment of rent. for mon-payment of eortain publie rates, and upon cattle siraying upon laud not belonging to their master. C'ittle so straying may be impoumderl and retained as sucurity till their owner make satisfaction. bistress ior mblic rates is allowed by the statutes inmming the rates. In this species of distress, and distress for aron-payment of rent, the articles are nut merely lient as security, lout may ho sold to pray the amonat dine. Whatever monds the lamellorel finds on the premessas, wen roulds herongfuis to a strabyer, may lie distreined: lmat animals ferer meture, aul goods delivered to thet tenant by way of trane, may not be taken. I limullord may, h,y special statute, 11 (reo. I]. r. I!), distrwin momls fraululently carried off the promises: ame liy the same statuite he may, with the assistance of the prace-othere of the prish, break opren dorns to

## DIVERGENT-DIVINATION.

found at intervals distributed round the coasts of Pritain, and it occasionally loreeds in the freshwater lochs of the north of Scotland. The liedthroated D. (C. septentrionalis) is also fomm in all the northern farts of the work, is more common in Britain than either of the other species, and is the lird generally ealled Loon on the Eritish coasts. In size it scarcely equals the Elack-throaten Diver. Its back is brownish-black, the belly white, the throat red. The flesh of all the lhivers is dark, twigh, and upalatalle. -The name D . is sometimes extemded to all the Culymbidet (4.5.), sometimes to all the Brachyptere (q. - $)$.

DIVE'RGENT. See Convergext.
DIVERTIMENTO, or DIVERTISSEMENT, a species of musical composition consisting of different movements, arranged in an easy style for one or more iustruments, lut not so eliaborately wrought out as the snnata, or other more regular compositions. The divertimento lias generally no fixed character, being merely a musical picture without ayy attempt at artistic effect, or other aim than to please the rar, and may be said to take its place between the Ltude and the Couricioso. The divertimento was greatly in rogne fluring the last half of the 1 Sth century; until then, the word had never been used to denite a musical composition. In France, divertimento is the name given to certain dances ami songs introfnced between the acts of an opera, or play, for the amusement of the zatblic during the prase, ant as such it was used there much eartier than in Italy or Germany.

DIVIDEND, the sum aprortinned to creditors from the realised assets of a lankrupt estate, and which is at the rate of so much per poumb of the clams. The half-yearly interest on the public fuuls, anil preriodical profits on shares in joint-stock undertakings, are also called the dividends, the lattur being usually deelared half-yearly, ly order of the lirectors. Uecasionalty the dividends do not exhaust the profits, and the surphs is allowed to acerunulate, until it is pail to the shareholders as an extra dividend called a bonus.

## DIYIDING ENGLNE. See Gradtation.

DI'YIDI'YI, or LI'BIDI'BI, the curved pords of Cesshlpinia coriuria (sec Ciesalpinia), a tree which grows on the coasts of Curaçoa, Carthagena, and wher parts of tropical America. They have heen long usel there for tanning, but have recently aecuired importance as an article of commerce. A consiclerable 'ruantity is now annually brought to 1rnitain. Dividivi is one of the most astringeut substances knowni.

IDIVINATION (Lat. divinatio), is the act of discovering the hidden, lnat more particularly the future, in a supermatural way. Men have at all times set their own imaginations alove the canses of nature, and by a curions suljective process, have endeavomed to ilraw out of thenselves what could in roality he only derived from a study of the laws of naturc: 'Thus, there have heen instituted systrms of smperstition among almost all nations of the whin at coue period of their history, which the !uarill of scientifie niservery and the bemedicent influmess of a ratimal refigion have faten to whally malieate, so that, even anong comparavely
 of this ald-world feeling. A mare succial use of the torm is to denote fortunetolinis or sorcery (midnh-age Latin sortiarius, one who reals the future lyy means of lote or sontes). It was a maxim with the nations of antignity, that if there are gols, they care for men; and if they care for ment they will send them signs of their will. This, with
some variations, has been a universal sentiment in all ages and countries. But it was the first step in this journey which presented the whole difficulty. How was man to know the will of the gods? The raricty of answers which this question has drawn fortli constitutes the history of divination. Thus, among the Grecks, the word for divimation was mantike, which signifiel more than the Latin divinutio; inasmuch as it was applied to any means by whin the Deity diseloses himself to man, while the Latiu word denoted more the power wheh man is supposed to possess of discovering the future. With the Grecks, the seer was passive; with the Romans, he was active. See Seer and Oracle. Astrology was a favourite methol of divination among the azaent Chaldeans, as well as in the middle ages. Auguries and auspices-both words derived from arie, a lird-were systems broucht to perfection by the liomans as means of knowing the will of the gols. See Acfures and Auspices. The sacrifice of lieasts, besides, the casting of the horosenpe, and the observing of the constelations, were all farourite moles of guessing at the futwe practised ly the Timmans. Tut the helief was not confinel to the Old World. The Arancanians, a warlike nation of South America, seem to have placed as implicit faith in the divination of birds as dill the Romans, and they practised this art in a way not very dissimilar. Even among ourselves, the merry-thoucht bone of fowls is known to possess a curions virtue, and hoys meed not be told the omens connected with the magpie.
An extensive set of omens have been taken from observing what first happens to one, or what animal or person one meets first in the morning, or at the commencement of an untertaking-the first-foot, as it is called. To stumble, has been miversally hele to presare misfortune. Some semblanee of io reasou might be found for this belief, inasmuch as stumbling may be supposed to indicate that that self-possession and conscious courage, which are in themselves half a victory over circumstances, are lacking-the want of them, therefore, being half a defeat ; but in most cases the interpretation seems altogether arbitrary. The dread of a have erossing the path seems to be widely prevalent; while to sce a wolf is a good omen. This feeling is probalily a remuant of warlike times, when the timil liare suggested thoughts of cowardice and flight; while the lohll wolf, sacred to Odin, was emllematie of rictury. The character of the hare for leeing unlucky is also comnectal with the deen-rooted belief, that witches are in the hahit of transforming themselves into hares. 'That to mect an old woman is unlucky, is another very general belief: arising, withont doult, from the same canses that load to their being considerel witches. In some places, women in gencral are muluck as tirst-foot, with the singular exerption of when of had reputation. This frelief prevailen as far buck as the age of Chrysostom. lriests, ton, are eminmes of evil. If honters of old inct a priest or friar, Huy eonpled up their hounds, and went home in despain of any further spont that day. This sumursition semus to have died out, exerpt in the rase of sailurs, who still consider the clory a 'kittlo cargo' as a S'entch skipper expressed it, and anticipute a stom or mischance when they
 the lays of tho praphat fomall.
'The observation of lurty aml unluck! days was once an impurtand matter, and was often the turningprint uf great events. It is unw confincel to the one anhject of marriage. In fixing the wedding-day, May among montha, and lirilay among days, are slamed liy may perple both in the higher and lower orders; fur in this matter, which is the 098
exclusive province of women, and in which sentiment and fancy are in every way so much more active than reason, the eduented and uneducated are reduced to a level. f'erlaps half the superstitions beliefs that yot survive among civilised and Thristian communities, group themselves round the suldect of lowe and marriage-of such intense interest to all, yet so mysterious in its migim, and problematical in its issuc. The liking or passion for one imivilual rather than any other, is sur macemonalble, that the mod of Lase has been fabled blimel; it is of the nature of fascinatiom, maria, spell. And then, whether happiness on tho rower shall be the result, seems beyond the reach of ortinary calcuation. All is apparently given wer to mystery, chance, fortume, and any circumstancers may, for what we know, influence or indicate what fortune's wheel shath bring rombl. Hewee the immmerable ways of prognosticating which of twe or more persons shall be first married, who or what manner of person shall be the future hushand of wike, the number of children, \&c. It is generally at particular seasons, as at the Eve of Sit Agress and Hallowe'en, that the reil of the future may thas he liited.

Sucezing, likewise, has long been looked upon as supermatural, for this reason, that it is sudilen, maccountable, uncontrollable, and therefore ominous. 'llue person is considered as possessed for the time, and a form of exorcism is used. A nurse Would not think she had done her duty if, when her charce sucezes, she did not say: "Pless the child,' just as the Greeks, more than two thonsanel yeurs age, sairl : 'Zens protect thee.'

One general remark, bowever, it is important to make in regard to omens. An omen is nut conerivel to be a mere sign of what is destinen to be, it is conceived as causing in some mysterions way the event it forebodes ; and the consequence, it is thought, may be prevented by some counteracting charm. Thus the spilling of salt not only forebodes strife, but strife is conceived as the consequence of the spilling of the salt, and may lic hindered loy taking up the spilled salt and throwing it over the left shoulder.

An important exercise of the diviner's art is to Actermine the imocence or guilt of proties. This will be treated under Orpeas. Put it would lie impossille to enumerate the endless modes of divination for which learned names have been found. Some of the principal aru-Adinomancy ( $\mathrm{q} . \mathrm{v}$.), Belomancy (q. v.), Bibliomancy (q. v.), Botanomancy, or divination by means of $p^{\text {lants }}$ and flowers (it was practised by the ancients, who were wont to hruise pepy-flowers letwixt their hands, nader the conviction that they coulch therely discover their loves. Hence Theocritus calls the prlily Teliphitos, quasi Dediphilos; i. c., a tell-lowe Goethe has made a beantiful use of another form of this superstition, which existed among the Tentonic races no less than among the old Grecks. The child-like Margnerite, in Faust, seeks to discover whether or not Fanst loves her by plucking the leaves from a, star-Hower, mumming alternately, 'He loves me,' 'He loves me not,' and finds to her joy that the lust lenf comes away while she is saying, "He loves me") ; Capnomancy (q.v.), Cheiromeney (q. v.), Coscinomancy (q. v.), Crystallomancy (I.v.), ('up, Divination luy (c. v.); Geomancy (this was anciently practised liy casting pebbles on the grounl, from which conjectures were formed; but the Arabian genmaney was more recondite, being founded on the effects of motion under the crost if the earth, the chinks thus produced, and the noises or thunderings heard); Mydromancy. divination by water or by a mirror, in which the diviner shews
the image of an about person, what he is cloing, \&e. (this monle of divination lays an importint part in the Arahian romances); Lithometory, : sperems of divination $p^{\text {erifrmel }}$ by stones, lout in what manner it is diffinult to ascertain; omeiromenry (sce Dalavs) ; F! fromemoy, or divination hy flame (it was common anmug the Greelis and liomans: if the Honne of the sacrifien was viporous aml ynickly mmsmed thre victim, if it was clear of all shoke, and did not crackle, lut ham silently in a pyramidal furn, the oncen was favouralle ; wher-
 :emb 'Praphim (g. $\because$ ).
 the somece of the power clamed thr the momarch, ly the royalist party, in the great controversies betwern the monarchical and the perlinnentary or commonwealth farties in England in the 1:th century. The monareh was hell to be the immediate representative of the Dcity, to whom alone he was responsilde for all his actions-a a principle which, of course, relieved him from all human respunsibility. The intea was little known in this comntry until the quict transfor of the crown from the Tulur to the $\mathbf{t}$ tuvart dynasty shewed that the luereditary prineiphe was firmly establishut. It was finmed liv some ecclesiastics in the doctrines of the civil law, which, in imitation of the practice of oriental nations, flattered the lioman emperoms by attriThing to them a power founded on tlivine institntions. 'Throaghout a long anil miscrable contention, divine right was on the one silde maintaincd to he the source of political power, while on the other it was maintaned that that power emanated from the will of the people, expressed in what was called 'the social contract.' The chicf writers on the side of divine right were Sahnasius and Sir liobort Viliner: in the other, Milton, Alyernon Sydney, and Harrington. The controversy revived in the disenssions which caused the French revolution, long after the settlement of the crown on Williann and Mary and the Hanover dyuasty had settled it in Britain.
DIVI'NE SERVICL, a temure by which the tenant was bound to do some special divine service, as to sing so many masses, to distribute a certain sum in alms, or the like. It differed from Frankalmorign ( (I. V.) in this, that the lord could elistrain for the former, not for the latter, which, leming an intefinite service, conld be enforced only by a complaint to the ordinary or visitor.
DIVING. The 'treasares of the deep' have at all times been the subject of much visionary exaggeration, and the accounts of the explaits of livers equally extravagant. We could name a popular schon-book, still in extensive use, where clibhern are seriously informed that the pearl-divers of the East acquine by practice the prower of romaining under water from 15 to 00 minutes. Such statements are common enough in narratives of ancient date, in some of which the time is extendel to two lowurs. It need scarcely be said that these accumbts are ahsurd, no such endurance luing $1^{1008}$ sible. The more slilful divers may remain under water fur two, ar even three minntes; some molern accounts say four. aml even six, lat this is rery dumbtul. Tu a swimming and diving contest letween some Sorth American Indians anil Endlishmen in a Lomben swimning-bath, one of the Indians, a renownel swimmer and diver, remained under water jnst mon minnte ami a half, but a Lodun artisan hat him ly a few seenuls.

In the Encylopretiue Britumica, Professor Faraday describes an interesting fact to which his attention was directed by a gentleman connected with the

## DIYING-DIYINC•BELL

Asiatic Society, who, acemdine to Professom Faralay. was the first to make the observation. It was (b)served that hy lowathe hard for a slowt time, as a I".man ines after winhent exercise, the beath rowh thea be held mach longer than otherwise.
 beath tor three-quarters of a mimate, if he attempted it withont preparation, I wht that after eisht on ten of such formi inspirations. he conld hold heath for two minntes. This he explainal on the sumpition that. cortinaridy, a comsidrable quantity uf carlmone aril $r$ mains in the involved passages of the lumes, hat that it beames completaly expelled ly the forced brathing, and it phace" sumpiod by atmor spherie air. As regrats the moselty of the whemvation, frofessm Fambay is mistaken, as the writer of this can testify, for wholl a hoy, he mot his enmpmion lathers in the surpentine, in lyyle lark, commonly practised it. The ket fanlinn amt the artisan abow refered to alow dial the smme; it is, in fuet, is sont of fueparation that a practised diver would make almost instinctively. Atter a fow depp inspinatime of this kiml, a sense of gibliness is folt, and it is not proment th cary the expranent far beymul this stare, as a hit of insensibility mot mulike apoplexy is apt to resmlt.

This einhmess, which is always probluenl, and the posshle monsibility, indiate a difierent exphantiom from that of Farmay. The mere removal of resilual carlmic acid from the langs is not suflientint to explain these: we shombl rather sugest that all the phemmena result from an exeessive oxyrenation of the lifond, and a comsemuntly aceelerated eqrentation similar to that porlues hy breathing nitrons oxide. It will he easily umberstinu, that if the home he forcen to take an exees of oxygen, a horar time shondi clapa before a fresh sniply would beome nevessary-that is, before suffecation wonlel tieke place; asd the gidtiness, Howhints of the face, and the insmsibility, are results to be oxpeted from such an cxeres.

Dhast divers suffer sivery from the eontimal rffonts in holliner the loreath; Idondshat eyes and spitting of blool are common amons them. This rude nomle of diving is mon but little used except for prarl and songe fishing; and even for these proposes, only an uncivilised pends, with very little rapital and kombedre, would continue to nse it. as the medern apdications of sciesce :dfowt such inmense arvantases for all kinds of shlaquens "pmatimes as will lee seen hy the next andel?.

## DIVISION-DIVORCE

The symbols of (ivision are $b) a\left(\frac{a}{b}\right.$, or $a \div b$, where $a$ is the dividend, and $b$ the divisor.
There are varions methods of division, such as the Enclish, Flemish, Italian, Spanish, German, and Indian methods, which differ merely in the mamner of arranging and disposing the numbers. The Euslish method will be found explained in all the ordinary text-hooks of arithmetic. There are also rules of division for the division of integers, fractions, and alselraical quantities. The general rule for the division of vulgar fractions is, to multiply the one by the reciprocal of the other: The division of decimal frations is performed in the same way as the division of integers. Anl, in aldelia, division is practically performed as in arithmetic, either by making a fraction of the divilend and divism, and reancing the numerator and alemominator hy the parts common to both, or elee ly diviling the farmer by the latter, after the manner of long division. Nee any text-luok on Alcebra. For division ly Lugarithons, see Londmons.

IDIVISION, Benefit of. Py the law of Scotlanl, co-cautioners are each ultimately liable for the whole deht which they have graranted. Wach, howerer, is liable only for his own proportion, so low as the others are solvent, provile? he has mot expressly renomed that privilece, or is not bound cminuctly and severally with the primeipal debtor, and the deht must this he divided amongst them. 'The law of division is not affected by the Mercantile Law Amendment Act; and it is therefore nccessary, whre there are more cantioners than one, that all should tre proceded against.

DHVISION, in Military matters, is one section of an army, indefinite in point of numbers, but establishel as a matter of comveniance. It wiften comprises infantry, cavalry, and artillery, and is in cllect a small amy in itself, commanded by a eneneral ufficu. In the Crimean war, for instance, a Finitish division comprised two brigades, wach of thre or four liattalions.

DIVISION, Navil, was a secomdary group of ships in a larese flect, cenerally three to a spmatron Int very large and complete ilect, there might he as miny as nine alminals or theneffeers commanting nime divisions, in three squathons of three disisions Path. The distinction of sumamon has now heen abolished, and intivinual ships are ton gisantic to allow of large numbres bine mancured in me thect.
DIVISION OF LABOUR, or DTVISION OF DSMPLOYMENT, a term witen nsed ly political cenomists to express a means by which labour is "comomised, or, as another methot of stating the same result, by which production is increased. "The problem in division of labour is so to aljust matters in any given community that each member of it shall work, in he ahle if he pleases to work, with the sreatest possille results. In practice it is, like mast other arramements, apt to be ton hroul or too narmow. The rild term, "jack of all trades and master of nome,' explessers the truth, that popile who try too many thnges are mot likely to be ablope in any. (ny the other lame, fow jupple can don any surt of worl to great pronetion, manss it is part, as it were, of a ${ }^{2}$ romp of functions for which they ate mone or less prepared. A gexel dentist will le in fom masure at surgeon ; a comeyancer or a special phater will know something of the other departmonts of legal practice; a shipwright will be aibe, on weasion, to do other kinde of earpentry, and he will be the better of a general lonwledge of the
 which it really proluctive, is where at man who em do several thinges selects one as that which he can
do best, or has most opportunity of doing. By constant practice at that one thing, and the withdrawal of his attention from other matters, he achieves perfection and rapidity of execution. There is an important difference between this selection of a special pursuit, and the inatidity to do anythine more than one thing. which is often confoundel with it. In the former ease, the worker, whether with head or hand, has great resources, for his alopted pursuit is the best, ont of several others, on which he ean fall back. The man who can do only one thing is in a precarious condition, because thit rone thinf may be sumerseded. Indeed, as the (ne thing which can be so done is generally a very simple thing, it is almost a law in political economy that it will come to be superseded by machinery. Such was the fate of the hand-loom weavers, whose function, esuecially in the plainer and lighter fabrics, was too easy to last. Of the livision of unskilled and easy labour, there is an excellent illustration in Adam Smith's description of pin-making: 'One man draws ont the wire, another straights it, a thirl cuts it, a fourth points it, a fifth grinds it at the top for receiving the hearl ; to make the head requires two or three distinct aprations: to put it on is a pecu. liar business; to whiten the pin is another; it is even a trale ly itself to put them into a paper; and the important business of making a pin is in this manner divided into above eighteen distinct operations, which in some manufactories are all performed by distinct hands.' This division was doubtless useful, so long as pins were made entirely ly human hands. It prompted scrious inquiries, however, how far such functions were of an improving or a deteriorating character, and ussays were written to prore that in manufacturing countries human beings were deteriorating, as no one of them had the faculty of self-support in separation from his fellows. and none conld even make one single article by himself, all being dependent for their bread on a complex co-operation, which might hreak down any dayThe answer to such fears may be found in the pinmaking of the present day, where one man tends a machine, feeding it with wire at one end, while the pins drop out at the other. This, tno. is the fruit of division of labour, for many skilfnl heads and hands have been occupied in hringing to perfection the different parts of the machinery. It is of the highest inportance to the working-classes of a country, to kep in wiew that though the division of labour does sometimes create functions which, Whit they are extremely simple and easy, are of valne as belping other functions to go on, yet this kind of casy and uniform work has no stability in it, and the possession of the facility for doing it acquired by practice is no permanent industrial colowment, since it is pretty sure some day to be superseded ly machinery:

Divitorif. See Divisun. Sce also frme N゙omeza.

DIVOREA, is deffined hy a Srottish writer to $1_{n}$ 'the disrution, hy the at of the law, of the conjugal tic. mata ly a comperant court on due eunse shuwn.- Frascr, P'ersand Domestic Relutions, i. 645. This infhition correctly expresses the law of divoree as it mow stimes in the United Kinglom. There are some dillimuces of detail in the working of the law in Fughen and Foothad, which will be nuticer below.

The desire to chltain a release from the matrimonital bual hass exintom at all times and under all logral systems. la heathen nations, this release was uften grantol on the slightest iproumds.  ness to the marriane vow, liven this limated gronard fow dissonation of marriage is cemied hy at labe purtion of the: flacistian womb. liy the civil litw, su it exintol for smme centurios after ('laristianity, a EMater laxity was allowel in remarel to divence. 'The Emperor (omstantine was the first to frohnthit dissobation of mariatre ly simple eonsent of the protics. 'Ins practice was again revired water tho J'mperors 'Theorlosius and Valoutinian: :nul thomest thase emperors subserpuntly resembed this mied, yet the rule as to the grommis on whol maryinge minht be dissolved continned tor flnctuate. lby the camm law, marriage was ragamerl as a sactament; and though marriages contracterl in disoberdionce to ecrem rules might be decharerl null ab intion, a natriage validly contracted wonld not be dissolved except by papral dispensation. But the male of the eamon law was not uniformly arlopted liy the states of Faropor, and it was not till the fimous Comeil of 'Trent iscumel a decree, in its 2 th session, in 1562 , dechaing marriage indissoluble even aiter the aluliery of one or both of the partios, that a unform rule on the sulijeet was cstablished. liut before this decree was issued, the reformation hat mate promess throumhont Enrope, and thas a "hange again took place in regrard to the law of divarce. It shonkl be observed, that thompl ly the canon law divosce a vinculo mutrimonif was mattainalble, parties might ohtain a separation a mense et thomo. The nature of this remedy will be explatined below.
Romm Catholic countries adopted the mincipus laid rlown by the Council of Trent, and this rule continues to be in force in most conntries which are in the lioman Catholic communion. fint by the (orle Civile of lranee, divorce is allowable on the ground of adultery and certain other causes. Comatries which adopted the reformed relicrion. have variad greatly in the males established in regad to the question of divorce. In 17 olland, divoree is promitted on the gromml of adultery and desertion. In America, the practice varios in dillurent states. 'In several of them no divorce is granted lut liy special act of the legisliture, acordinir to the English practice; and in others. the legislature itself is restricted from granting them, lout it may confer the power on conrti if justice. So strict and scrupulous has been the policy of Sonth Carolina, that there is $n o$ instance in that state since the revolution of a divorce of any kund, either lyy sentence of is cout of justice or ly act of the leqslature. In all wher states, divoree a vimenlo may be granted hy comets of justice for alultery. In New York, the jurisdiction of the courts as to absulnte divorce for canses suliseguent to marriage is confined to the single cause of adultery; lut in most of the other states, in addition tis adultery, intoleable ill. usage, or wifful desertion, or unheart-of absence. or hahnitual drunkenness, or some of them, will inthorise a docree for divorce re rinculo umber dillerent modifeatimes ancl restrictions.'-Kent, ('mmm. iv. 10\%. In Fingland. previous to the passing of the late Divoree and Datrimonial Act, marriage was ly the common law indissoluble. It was, indeerl. comfotent to olbain a declaration of nullity of marriage on the rrombl of relationship, previous marrine of one of the parties, mental or physical incalracty. or courcion. But the judgment so obtained was not a
decreve of divorce, but a doslaration that the marriagr tir botwern tho partios hal merarmally ben

and of angels by holating that the assumption of imulies was only momentary, or in appearance. Aml When the Gnustic Christians found it impossible to conceive the essential union of the divine nature with a borly composel of matter, which they hed to he the seat of all evil, they had recourse to the same expedient. 'I he difficulty was fot over m one of three wiays: the borly of Christ was cither considered is real earthly body, but not helonerims essentially to bis natire, and only assumed for a time; or it was dechured to be a mere aple:rance or illusion; or, tinally, it was believed to be a lueavenly bouly, composed of ethereal sulostance, thongh havins the appewance of beiag material. All the Gostic herctics hell Docetism in one or other of these thre forms, with the exception of those who were led by the same diffoulty to dony the divine nature of Jesus Christ, and rednere hin to a mere human sage. While the first of these alternative forms of heresy seems t: bave completely died ont, the last, under barions names, has contimed to the present time. For a clear and learmed accomut of Docetism, consult Tembler's Dumanteschichte (History of Doctrine). Eu: lish ly J. E. Fyland ; publisbet by H. G. Iohn, in 2 vols, 185 .
I)OCK (Lreuthum), a sub-genus of the genus Rumor, the other species of which are genmally called Burral (q. y.), eontainiug those which are hot acis, and of which the thwers are hermaphrobite. They are large peremial herbacents plants, natives chietly of temperate climates, with large gemerally lanconate or ovate leaves, and panicles of small greatish thowers. 'They have ereat tup-roots, and are with difficulty eradicated from protures. They also multinly raplly by seed. The loest mode of dealing with them, is generally fomed to be repeated antting away of then leaves amel slouts, ly which the plants are killed. Many of the species prefer watery places. A number are natives of liritain, and several of the Emopean ones have furm their way to North America, where they have lecome tronblesume weerls, a numLer of ratly indirenoms species being also fumme there. Useless and even troublesome as the 10. is generally estermed, yot the large astrinment roots are capable of beiner bencticially employed in medacine : amd those of the sroat Water I). Wret dowlis are enemerally suromuled by guay or wharf walls of masonry or brickwork, fate where
they are wanted chiefly for laying up vessels in, and not for loading or unluading, thew mamin is sometimes only a natural sloping bench. 'lhey are of most impurtance in plates where there is a great rise and fall of tide, such as at Lristol or Liverpard, where they are almust indispusable ; while, aqain, in the Clyte, where the thles are small, they have not yet been used, thounh they have been frojected at Glasgow for many years jrast. Wet docks are renerally entered by hetas of what is called a Tock (sce lack), having two gates, in one leaf, os more frequently in two foldimg-leaves each, which enables vessels to enter or depart for a eonsiderable time before and after hich-water ; but frequently, for the sake of economy both in space and in cust, they hase only one gate, so that vessels can only enter or lepmert at or very near high-water, unless the wiater in the dock be ran down considerably below that level.

The water in wet alucks is sumetimes kept, by neans of fumping, lermanently at as high a level as that of the hiohest tides, when a supply of pure water can be procured, to brevent the silting cansed by the almissiom of any cousinlerable body of turbid water by the gates, but thiat involves the necessity of locking uy or down always cxeppt at the highest tilles The tendency to silt Hu ly deprosits of tins mat is of common oceur rence, and drednins, or som other julan, imust be resonted to for the purpose of keeping the dock reasonably elcur. In almust all cases, wet ducks require to he oceasionally ermitied for the burymse of elcaning.
bock-gates are generally opened and shent by means of chains worked by band, either by winches or enpstans: but of late years tliey have in somue cases lonen noved by hyilranlie machinery, is at Cimat Cimimsloy, the Vietomiar lum lis in tim Thames. and Almat Woek, leith.

With small tides, they answer very well, amb they arosenmetinns male derpenomer to brop vossels alloat at low-water; lut with thes of emashleralle rabse they are attemed with the disudrantace of lame vessels crommbing at lowwator, amb fran the lareat volume of water, genevally more or lesin turlinl, which enters at "very this, thay are mach more liable to silt mp than wet docks are. Fior ridhing thom of muddy dejosits, tha plan is sometimes reworteal to of lettime ont a rescrve of water with a sulden gish from an conclusine at the inner and, at the time the tide has recented. 'This is callod seouring. Noch is the proerss pursucd at lamborne: amb elsewhere.

The quaty of wet imi of timal docks must have mooring-ports or rings for making vessels fast to.

They are menerally povided with sheds to kere goods
 shipping on mondenting heavy articles, and with staiths on dreps in the rase of cobleshapinif porte, ind now they.very fregurntly have rats laid aloner them.
liry doness are used for the purpose uf latyiner vassels ilry for exammation or repairs. 'l'lay maty have theirentranee enthor from it wet dock or from at tidal larbour : but tho former is by matal the buttor arrangemment, as it almats of vessuls laning donker or taken wot at any time of then, and it linegs a more cepual pressure on the gates, thometsy makiug them less liable to leak. They require tulu buit of erobl water-tight maseary. The entrance has fencrally a pair of folding-gates pointimer ontwards, to exelade the water; lnit sumetimes it is closed by means of a caisson-viz, a vessel shitush somethin!s hat the hall of a small ship, and having a leed and tworstems, which fit into at growe me the masomry. 'i'los caisson is sunk into the prove by ahmitting water juto its interior, and is iloated ont argain by pampins ont the waters. When the tides are very Earen, dhe bottom of the doek may sometines be Male thol abe low-water, so that it may be rum dry without pumping ; but gencrally the buttom of is wey dock for the reception of any lat very small vessels is lolow that level, in which case a stemuengine and pramps, with a well amd water-chanuely leabling to it , are reguired for emptying the duck.

Section of Dry Dock.
The fone is neaty level, and the ked of the ressel to be docked rests on wooden blaclis fastenal down to prevent them thoating, and of such a height as to almit of the shipurights qetting nuder the vessel's bottina. Sille-shores are Put in, to keep the bessel in an uright position, and hlocks are fitten in under the bibges its som an possible after the water has lieen got ont of the deck. The sides generally consist of stone steps called alturs, for the purpose of fixing the lower cads of the shores, and also for the convenience of supporting the workmen's scaflohs. Dry docks are frequently made bang enongh to hold thre or four vessels of considerable size at one time, in which case they are placed, not in the centre line of the dock, lout ohliquely across, so as to give more available length.

The use of the graving dock is frequently suresseled lyy that of Norron's patent-slip. See SLIP. (iravingrdocks of large dimensions are very expensive works, and the difficulty of making them water-tight is very great. In many cases, therefure, recourse is had to a prontion or floating-dock, sumetimes termed a "cemel.' S'e Flostivg-Doci in supp. The use of the floating-lock, together with the application of hydrande pessure for the raising of ships, is to be sucn at the 'Thames Graving-Ducks, where there are two rows of cast-iron columens, five
fore diameter, and lif in call raw. The rows are fin foct apart, and tha pactioal worlime lometh is

DOCTOR (Lat. dorsere, to teach), a teacher. Oricimally, the worl inctor was usel, in accordance with its etymoderical derivation, to simnify a teacher in sconeral, and it was not till the ]athe c. that it lncame a title of homar for the learnel, irrespective of the function of commmicating knowledge. It had frequently arpended to it, in those carly days. some additional expression intended to characterise the peculiar gift of its pussessor. 'Ihhs, Thomas Aguinas was called the Doetor Angelicus: Bomaventura, the boctor Seraphiens: Mexander de Hales, the Doctor Ircefratabidis: Juns Ncotus, the boctor Sultilis; Roger Bacon the Ductor Miralitis: Willian Oceam, the Dochor singularis : Gregory of Rimini, the Toctor Authenticus; Tuseph (ierson, the Doctur (hristianissims: Thomas Bralwardine, the buetor Grofumdus: and the like. The worl hal long leen usen, even in the universities, as a general expressin for a teacher before it came to designate a degree or rank in the learncl hierarchy to which only the untell lomy of the teachers cond advance or promote the camblate. These formal promotims enmmencel at lioloma in the 10 the c. and the Lamed Imerins, the resenerator of the foman law at that fromb, is said to have introdnced the coremonial which was afterwarls universally adoptent. Irnerins, howera, is a sort of mythical hers in miversity history, and such statements with wome to him mast lo yeceivel with cantim. Se Pro. Mortox. The university of l'aris ahmost immedintely followed in the fontsteps of liohngan, the tirst reception of dencors having taken place in the year 114., in finour of Peter Limbard and Giblbert ha lorre the greatest thengmans of the day. sulisequently to this juriod, the emperem were in ase rxpresly to conter upm the universities the right of apointing doctors of laws by their anthority and in their mane. The exambe of the empers was spentily followed by the fepes, who conferrel correspombing rights, with reference to the
 whens reason to believe that, la, th in laly and Frane", the terms master aml doctur were jetty namy syonymons. In the Cerman miversities, the irofessons of theolog wore more commondy kuwn as masters: : and in the hegiming of the lith c., in arematace with the practice of the miversity of Irame, the distimetion was pretty amxistentiy male butwern doetors of law and moflicin. and masters of thoolyy and philowophy. chicfly found in the warmer temperate parts of the thobe. The name D. is often extenled to all of them. One or two species of Cusella are natives if Britain, parasitic on leguminous plants, heath, thrme, homs, nottles, \&c. A species of D . is very injurions to crops of hiax in Gerinany, and leguminous rims oftern suttir from this cause in the south of Smope. The seel of 11. geminates in the gromm, lnt the stem soon zerks to attach itself to plants hy litte rontlets which it sonds out, aml the original rowt dies. The appearance of 1). has heen described :14 resembling "fine, chas ly tanglol, wet catgut.'
 fontines preacher awl anthon, was born in lomalon in the year 170, zomI enlucatorl for the minietry at a thondrical academy at Kihworth, in Leicestershire,
presided over by a Mr John Jennings. In 1729, he became pastor of the dissenting congregation at Fibworth, and in 1729 receired a call to Northampton, where he also became president of the theological academy now removed from Kibworth to that town. Here he continued to preach and train young students for the ministry till within a short perind of his death, which occured at Lisbon, October 26,1751 , whither he had gone for the benefit of his health. D. was a man of the most amiable character, deep piety, and extensive accomplishments. His principal work is The Rise and Progress of Religion in the Soul (1750). It has been translated into: Dutch, Germau, Damish, and French. Besides this, may be mentioned The Family Expositor ( 6 vols., $1760-1762$ ); his Course of Lretures, delivered to the students under his charge, and published liy the Rev. Sammel Clarke ( 176 ) ; and a great variety of sermons on miscellaneous relicious topics. D. also wrote a considerable number of hymns, which hold a high rank among those used by English and Scotch dissenters.

DODECAHEDRON, one of the five regular solids, is bommed by trelve equal and regidar pentarons. See lierulaf Body.

DÖDERLE1N, LUDwig, a German philologist, was born at Jena, 19th Docember 1791; stndied at Nunich, Heidelberg, Erlangen, and Berlin; and in 1815 was appointed professor of philology at the acalemy of Eerne. About the year 1820, he went to Erlangen as second professor of philology, aud in 1507 became first professor and also director of the philological seminary. 1Iis principal works are Latemischen Syomymen und Etymotogien ( 6 vols., Leip. 1S26-183S) ; Lateinischen Wortbillung (Lein. 1838) : Handluch der Lat. Etymologie (Leip. 1841); Homerische Glossariam (1 vol., Leip. 1S50). D. has also edited several classical works such as the Oclipus Colomens of Sophocles, and the Opera of Tacitus.

DO'DO (Didus), a genus of birds commonly ranked among the Brevipennes (q.v.) or Struthious birds (Ostrich, Cassowary, \&c.), although exhibiting very anomaluus peculiarities; but still more iateresting beeause, whilst it appears to be now completely extinct, its extinction has taken place very recently, and through the agency of man; at least one species ( $D$. ineptus) being known to have existed less than two hundred years since. It is described by several voyagers of the 16 th and 17 th centuries, and seems even to have been brought alive to Europe. It inhabited the islands of Bourbon and Mauritius. That any species of D. was ever seen by European voyagers in Malagascar, is not so certain ; and the Solitaire (et. v.) of the island of Rodriguez, now also extinct, was a very different hirl. The D., aecoriling to the discriptions given of it by those who saw it, and which are confirmed by pietorial representations, aprarently not unworthy of confidence, was a lifid large tían a swan; of a very heavy, clumsy form and correspmong gait, with short thick seali-coverul leas; three rather short toes before amd one hehind; large hemd; very large bill, the "preer mandible longer than the under, and much homed at the point: the wings so short as to be of no use for thight, and furaished only with a few black foathers; the gencral plumage a kime of grayish-down; the tail merely a tuft or bunch of curiously curled feathers. The 1). was so aboudant when somes of the first royagers visited Dlauritius, that they locame satiated with its llush, although they deseribe it, particularly the breast, as good for food. The hirds were easily killed, being wholly

## DODONA-DOC.

unalale to tly, and rumamin slowly. 'Their apeody cxtinetion aftore the islamls leeran to be visited aml settled, is thes asily accomutal for. The 1). swems to lave been adnuted for living in tropical woorls, Where the luxuriant vasetation allumad it a rady supply of foorl, and its powerful hooked bill, which

Duda.
has led some naturalists to assign it a place anong birds of prey, was probaldy intented for tearing vegetable ain not animal substances. However singular this bill is in a struthions bird, it has been well remarkel that it is not more so than the very different bill of the aptemp.
There are rude figures of the D. in scveral works of the 17th e., and in particular one, evidently superior to the rest, in Buntius (edited by Pisn, 1658) -who calls the bird Dronte or Dodners-which perfectly corresponds with the descriptions miven of it, with a painting preserved in the British Museum, sad to have been drawn in Holland from the living lind, and with a representation of it discovered by Professor Owen in 1839 in Savery's pictume of Orpheus and the Beasts at the Harge, which he thinks 'must have leen copied from a study of the Ering birl.'

A foot of the D . is amonest the valucel treasures of the British Museum; a hoad and a foot are preserved in the Ashmolean Museum at Oxforl. It must ever be canse of regret, that a stufferl specimen which ouce existed in the Ashmolean Museum was allowed to decay, and finally destroyed in 175.5 by order of the curators, who little imagined that portions of it escaping their sentence were to become objects of the highest interest to the whold scientitic world.
DODO'NA, a city of Epirus, the seat of the ollest Grecian oracle there, is situated in one of the wiltest distriets somth-west of the Lake of Janina. 'l'the Greek and Lgyptian aeconts of its origin differ. The priests of Jupiter in Esyptian Theles related Hhat two holy women were carried off from that city by a party of Phonicians, one of whom was sold in Lybia, the cother to the Greeks, and that these women fonded the oracles at D. and Ammon. The inhabitants of D. related that two llack doves took their Hight from the city of Thebes, in Dyypt, one of which flew to Lybia, the other to D.; that the latter perched upon an oak, and with a human voice commanden that an oracle shonh be fomeded on the spot. Herulotus is of opinion, that if the Phonicians din actually carry off the two women alreatly alluded to, one of them was probably sold iuto Grecee; that the strange lanmage and dak complexion had caused thon to be likened to lirts; and that when they bocame acquainted with the Greck tongre, they wore saill to have spoken with a hman roice. Later authors ascribe the founding of the city to Dencalion. The sanctuary itself was
dedicaterl to dupitur, who manifested hinnself from the bougles of an mak, penathy ley the neis. of the wiml through the trac. This was explaind by the prists, who were termed belloi on Hellon. The
 others Il era, afterwards appeared hy the side of Jupter, and the phace of the priests was necuphed by priestesses, whan ammend the will of the deity: 10, though net "opual in reatown to Iolfhi, was yet freponontly comsultel on occasions of importance both hy thr SGartans and Athenians. Thugh the rity of 1). was destroyed in 219 1.4: hy the Atolians, it recovered at a later periond, was visiteal ly the lmperor Julian on his march to l'ersit, and was in existente in the 6 th e. A. D.

Dob'DSLAY, lomert, whememp phlisher, wat Twon in J70:3 near Mansfield, in Notthehant 11 i fathor, who is said to have been a selnmhaster, oph prenticed him to a stucking-weaver; bat linding this employment unsuitalile, I. ran away, and was afterwarls engaged as footman. While thens curponcol, Le devoted his leswre moments to readine anl the cultivation of letters, and eventually mblished, in 1732, a volune of poems, entitled The Muse in Livery. or the Footma's Miscellany. Wis next production, The Toon Nhon, a dramatic piece, was submitten in manuscript to Pope, who andertnok to recommend it to lich, the manager of Covent farden Theatre. It was acted under Fich's management in $17: 35$ with great success. The proceds resulting from the publication of these his first two works enabled D. to commence lusiness as a lookseller, in which trade he was very successful. In J7:7, his Fing and the Miller of Mansfipld was brought out at Drury Lanc, and met with an enthusiastic reception. This was followed ly Sir John Cockle at ("mort, The Blind Beggar of Bethol Gren, and Rest et Pontifor, which were republished in a collected edition of his dramatic works with the title of Trotes (174S). Meantime, be was conducting his busincss with such ability and spirit, that in tho course of three years after commencement he was in a position to buy coprrights. In 1738, he bought Johnson's London, giving for it mo mure than tom guineas. His most successful work was a tracmly called Cleone, which was acted at Covent Cavilen with extraorlinary success. On its pulitication, nool copies were sold the first day, and within the year the work ran through four cuitions. With - 'hoone he closed his career of aramatic authonship. D. was connected either as contritutur or publisher, and occasionally as hoth, with several magazines. He is, however, chiefly rememberel now on acconnt of his Stlect Collection of Old Plays (12 wols. Svo, 1780) : and his Collection of Poems by Several Hamls ( 4 vols. $12 \mathrm{mo}, 1748$ ). Besides the volume entitled Trifles, another volume of his collected works was jublished in 172 under the title of Miscellames. He diel at Durham while visiting is fricul, on the 2 ath September $176 t$

DO'FFER is that part of a carding-machine which takes the cotton from the cylinder whon carded. Sce Cardna.

DOC (Canis), a gemus of diritigrale (q. v.) earuivorons (4. v.) quadrupeds, which, as defined by Limave included all that now form the family ('onider (!. \%-) and also byænas. In the gemens as now restricted, wolves and jackals are gencrally included hy raturalists, along with those ammals to which alone the name Dor is popularly applied, and a distinctive character of prineipal importance is found in the purit of the eye, which is always
round-contracting circularly, whilst in foxes it assumes the form of a spetion of a kens when contracted. The present article is limited to dogs in the common acceptation of the term, wolves ani jackats being the subjects of separate articles; and only remarks relative to dogs in gencral will here find a place, many of the particular kinds being sufficiently important to be separately noticed.

At the very matset we eneountor one of the most perplexing and diflicult questions in uatural history: as to the number of species of dog, ant the crigin of the domestic dog: two questions in appearance but rather one in reality, and one on which the opimions of the most eminent naturalists are very much divided. Accurling to some, all domestic dugs are to be regarted as of one species; and as in the case of some other valuable clomestic animals, that species is not certainly known to exist in a truly wild state, alI the wild dogs which must be admitted to belong ta, the same species bing siewed as the uffsping of domestic drigs which have returned to a wild state, and in which, however, it is supposed that the original type or characteristics of the species. modified hy domestication, have in a ereat measure reaprearel. According to others, there are numerons species of dog, nriginally distinct, which have been domesticated by the inhabitants of different conntries, but which, however, are very nearly related not only in their physical characters but in their dispositions and in some of their 1 nincipal instincts, and which were capable of intermixing, not perhaps indiscriminately, but within certain limits, and so as to proluce new races. L'y some who holl the first of these opinions, it is further maintained that the wolf anil the doy are one species, and that all clomestic dogs are derived from the wolf; whilst others advocate the clams of the jackal to be regardel as their original farent aul type. Hy some if those who hold the species to le mumerous, it is supposed not improbable that the boon of wolves and of jackals may be mixel in some of the romestic races with that of the original ulogs. - It is impossible for us to do more than state these different views, and a few of the principal arguments by which they are supportel.

It is admitted on all hands, that there is great diversity among the different kinds of domestic dugs, nany distiuct races having lomg existed, which differ not only in size and other physical characters, hut to a notalbe extent alsu in chisfositions and instincts; it is further admitted that there appear to be no definite limits to the possible intermixture of these races with each other. great is the diversity of 1 bysical charaeters, that naturalists of the greatest eminence almost acknowlelge themsclves incapalde of pointing ont any that are common to all duge, and yet distinguish them all from the different species of wolves and jackals: and in fact, the recurece tail, not apparently a character of the first importance, is named liy Cuvior hinself as the most certain and unvarying specific rlistinction. The obliquity of the eryes of wolves is also contrasted with the more forward direction of those of dogs, which is accounted for

- in favour of the then'y of wollish origin-ly the surpusition that it results from the constant halhit. for many successive gencrations, of looking forwards to thair mastor, and obeying his roice.'-bell's British Qumblupeds. This, on the nther side, is treaterl with ridienle; it is certainly a tramsition from the regiow of ohservation and ascertainced fact to that of more theory and comjecture. In size, dugs diflier sol widly that one is mite as large as the had of anther; the difference in form of Thenly, hual. or limbs, is almost mpally grat betwen the Newfomdand log or the Mastall and the

Greyhmal. The gradations, however, from one form or charaeter to another, remler it impossible to draw a fixed limit. In some races of dor the hivel-fect as well as the fore-fect have five toes, instead of four, which is more common; but this has not lieen much insisted on as a ground of specitic distinction. Greater value ought perhaps to be attachel to the want in some, as the Iholes (q. v.) of Tudia, of the seeond tubercular tooth in the lower jaw; the hairiness of the soles of the feet of some is perhaps also not umimportant; and in farour of the opinion that domestic dogs have orginated from an intermixture of several species, it has been urged that the number of teats in the female varies, and that there is sometimes even a difference between the mumber on one side and on the other, which has never leen observed to be the case in wild dors, and in them the number in the same kind is always miform. Some of these points, however, have not received the investigation necessary to a confiliont determination of the measure of importance which ought to be assigned to them.
It seems to have heen ton hastily taken for granted, in favour of the onimion that there is only one sprecies of doc, that all the wild races, even the dholes and the dingo, have simung from domestic progenitors. There is certainly no evidence of this; and the fact that wild races exist, exhibiting marked diversities of character, in countries widely remote and of very different climates, is referred to with confudence on the other side, as afforming at least a strong 1 resumption in farmur of the supposition that man has, in different countries, domesticated the species which he found there. We do not yet know enough of the amount and limits of the changes which circunstances and climate may produce, to warrant any confident couclusions on that ground. And if we were to adop, the views of those who ascribe least to snch canses, we might yet demand them to shew why, althongh from certain original types no mixel race can originate, there may not yet le other original types capable of such combination, or why the limits mast le bell equally impassable between all that were framed by an original act of creation. That there was only one original pair of the human race, may he held, without our of necessity holdines that there was bnly one oriminal pair of dogs. but to this consideration due place has. perhaps, scarcely been given.

That the common fox-or any species of fox-is a parent of any race of clogs, is mot the opinion of any naturalist. There are inded sonte dors, particularly of the Routtish sheplerd-dog we colly race, which have a somewhat fox-lik" appearance; and a shepo horet may sometimes be heard to speak of his dog as in fart of fox-blood, but there is no well-anthenticated instance of commixture letween the fox and the dug. It is otherwise with regard to the wolf. Instances of emmixture liave certainly nccurred, and without the compulsion of continement; but such instances have apparently been very rare. Nor is it asertaine that the promeny is permanently fartile.
ln favnur of the specitic identity of the $\log$ and wolf, we of the strmpest argments is trawn from the minality of the perind of gestation- 63 days. lint it may ln remarked that an inequality of the feriont worlh hate affinded a much stronger argument on the other sidn.

Against thu indentity of the dog and woll, the ditlerenco of disposition has bern strongly urged. ln reply, it is shewn ly well-anthenticated instances that the wolf as very capable of that attaclument to man which si, reniarkally characterises the dog. There is preater salue, perhaps, in the argment of Colunel IIamilton Smith, that ' if domestic dogs wero

## DOG.

merely wolves modition by the inflatne of man's wants, surely the curs of Moltammedan states, refused donestic rare, and only tolerated in Asiatie cities in the capreity of seanngers, would long since have resumed some of the cheracters of the wolf.

Ginfon's motion, that the shephardeden is the: original type of the whole species, from which all dogs are derived, is merely fanciful, amb his emeavour to support it ly it comprative view of the different kinds, only exhihits a certain ammat of ingemuity.

The shepherd's dor is oun "f the kimels of don having ereatest development of lorain, but it is still greater in the spaniel. Tha skulls of dogs, howerer, neither exhibit very marked distinctions when com pared with each othor, hor when compared with thase of wolves and jackals.

It is miversally believed that the diversity of columr exhibited ly many dung in a result of domes. tieation, as it is meither fomm in those which may be supposed to exist in a state of original wildness, nor in those wild races which are certainly known to be the progeny of domestic dogs, a return to uniformity of colouring being apparently one of the most specty consequences of a roturn to wihness. 1hlack, reddish-brown, and white, the miform coleurs whservet in wild dogs, are, however, the colours which chictly appear mixed in domestic races.
l'embunus cars are gencrally rexarded as another rosult of domestication in dugs, as in rablits; and it is ertain that the wild races linown have erect and pointed ears; but no wild race has been diseovered at all corresponding to the mastill in some of its other most notable characters, particularly the shortness of the muzzle. and depth of the dhops. and it has therefore been conjectured that this and kindred races may have derived their origin from some wild dog of the interior of Asia, which has not yet come under the notice of any scientitio observer.
The doy has been a domestic animal from a very early priod. The earliest allusions to it are in thie books of Aloses, but they inteel correspond with the dislike and contempt still commonly entertained for it ly many of the nations of Southern Asia. Ly Homer, however, it is very differently mentioned; and 'there is not a motern story of the kind whel can surpass the affecting simplicity with which the proor dog's dying recognition of his long-lost master is related by one whw wrote, probally, not less than 2700 years ago.' The sculptures of Nineveh, and the hieroglyphics of Egypt. attest the very carly domestication of the dog, and the existence of races similar to some of those which exist at the present day: and the high value attacherl to it lay many nations is further attested by the place assignel to it. or its image as emblematic of the attributes which they ascribed to their gods. We do not now set so high a valuc on the dog, in consideration of mere usefulness to man, as on some of the other domestic anmals; yot to the savace it is perhaps the most important of oll, and some have supposed that by its aid the suljugation of other anmads may have been first accomplished. S'ustior makes the strong assertion, that the dog " is the most complete, the most singular, and the mast useful conquest ever mate by man.' 'The dow far more than any other animal, becomes a humble friend and companion of man, often seeming actually to know and sympathise With the joys and sorrows of his master : and on this account it is, that he is alike the fampered minion of royalty ant the half-staryed partaker of the heggar's crust.'

The uses to which the dug is applicd are muncome and correspond. in sonu measure, nut only with distinct physia:al characters, but with remarkably
distinct instinets of diferent herels. Thas, whilst
 beasts of draught, pertioularly for drawime shederes in tha frozen reginas of tha north ; atul in other cometrins whictly fon the chase, the expuisite sechat of sembe bimbs, ans the remarkable flectness of others, varionsly remmomening them for this use: we dind them alsor roldering impurtant services in the eare of shect and other catth, and muldowed with hereditary instimets womlerfully fited for this [mpase, and we tind them, with like :alaptation of instinet, highly valually in watching and protecting the alumbes athl properties of the ir musters. Not the least interesting of the (anuldymants to which the dong has beren devoted hy man, is that of leadime almat the ldime, which is often done with inn intelhigent :und affectionate sulicitude lighly worthy of admiration.

Anemates illustratine not only the instincts, lut the intelligence and affection of dogs, are familiar to "sery on", and fom une of the nowst pasing parts of many a book of natural history. Attractive to children, they are worthy of all the consideration which they can receive from the most phalosophic mind. Volumes have bed tilled, and more volunes minht easily le fillerl, with ancelotes well authenticated, and well worthy of preservation.

The dong protuces usually from six to ten young ones at a binth. They are lorn bind, open their cyes about the tenth of twelfth day, attan their full growth in alout two years, schon live more than twalve or fiftern years, and ahost never more than tweity.

Nor satisfactory classification of the different kimus of duo las ever beon male. What some maturalisty regard as types of species, "thers $\mathrm{p}^{\text {romonnce }}$ to be mere mungrel races. Nor can any principle of arrangement le fornd in form, roughness or smoothness of fur, or other such character, which will nut associate hinds that are in other respects widely dissimilar, and separate some that are nearly allied.

DOG (in Law). The keeping of vicions or destructive dors, or other animals, except under proper precautions, is illegal ; and the proprietor is liable for the damage which they oceasion in all cases in which it ennot be clearly shewn that the fault lay with the party injured. Even before the injury occurs, it is competent to enforce measures of precantion. If a man have a dog which he knows to be of a savage natme, and addicted to bite, and he allow it to go in a frequented place withont being nuzzled or otherwise guarded so as to prevent it from committing injury, he may be indicter in England as for a common musance. If the dog be of a ferocions kind, as a mastiff, it has been held that he must be muzzled ( 1 Russ. 303) ; and it will be no defence in an actiou of damages against the master, that the person injured trod on the dog's toes, for he would not have troulden on them if they lad not been there ( 3 Car. and P. 138). The harbourmg of a dog abont one's premises, or allowing him to resort there, will warrat indietment (M'Hone and Wood, 5 C. and P. 2). If a dog known to his proprietor to have previously bitten a sheep, be retained by him, the proprietor will be liable to all subsecgnent injuries even to other animals, as, e. g., a horse. (Enn's Justice of the Peace, vol. ii. 1r. 333.) In Seotland, a warraat may be obtained, on proof of vicious practices and danger to the public, either from the sheriff or the justices, on a snmmary complaint, to have a dog secured or slain, and the owner found liable in expenses. The complaint may be at the instance either of the fiscal or of a pivate party, with or without the fiscal's concurence. An interdict may be granted against the dos going loose pendiner the discussion of the question as to whether or not he ought to be killed. Many local proliee acts contain provisions as to shatimg up or muzzling dogs during the prevalence of weather likely to produce lnydrophobia; and where sueh do not exist, the subject may be dealt with by the magistrate at common law. Formerly, the common law of Encland helel that it was mot lareeny to steal any of the haser aumals, in which class all dogs, exeept those of value, were included. But by 7 and 8 Geo. 1V. e. 29, dug-stealing was declared to be an offence pmishable by fine. This act was repealed, and new regulations of a more striment kiml made by 8 and 9 Vict. e. 47. By that chactment dor-stealing is a misdemennow, monishable, on summary conviction, for the lirst affence, hy six months' imprisonment and haril lalour, or fine not exceeding t'0 beyond the value of the thos. The seeond offence is an mictable one, $1^{\text {nmishi- }}$ able hy fine or imprisonment amd hard lahour not axceeding eighteen months, or both. Similar punishment is proviled for persons foum ins possension of dors or dors-skins, knowing them to lave ben stolen. A iok goine into a meishlours fich does not allorle gromel for an action of trespass unless he does mischief; and even then the frem who lills him in certain eireumstances, may be liald. in limanes ( 2 Marsh. 5st). The use: of ileng for purposes of immont was prohibited mulur a pualty lyy 2 and : Vict. $c .47$, whieh is "xpatined by 17 and 18 Viet. $\because$ e 0 , 2 , Nee 'helely tu Anmals.

end of branch, with leaves and fluwers; $b$, a flower cut open; $c$, fruit.

## Cavadiay Memp (A.

cannabinum), a plant noticed on another account in the artiele Apocynacec, possesses similar properties, and is frequently nsed in the United States.

## Do'g-DAYS. See Canicular Days.

DO'G-DRAW. An apparent deprehension of an offender against venison in the forest. Dog-draw is where any man hath stricken or wonded a wild beast by shooting with a cross-bow, long-bow, or otherwise, and is found with a hound or other dog drawing after him to receive the same.-Cowel's Interpreter.

DOGE (equivalent to duke) was the name of the chief magistrate, possessiug princely rank, in the republics of Venice and Genoa. Dogate or dogado, both from the Latin ducatus, doehy, is used to indieate the dignity of doge. We tind doges of Venice electal by the people, lat enjoying almost the rights of absolute monarelis, as enrly as the heginning of the Sth eentnry. Their power, however. was considerably reduced towards the end of the 12 th $e$, throngh the ereation of a Great Comeil, composed of 470 members, chosen from mobles as well as citizens, and invested with legislative power. Thuse afterwards appointed six of their uwn momber to superintend the doge in the exreise of his excentive power. Further, the meguli, or noldes, wha formerly were admitted by the duge to a slare in the pmble allairs, were wramised into a recular lowal of alministration, mimaring (0) mondras. by the now constitution, the f"eple, tom, last the must essential of their rights - vi\%, the right of clecting the dome. This right was buw rhanged into a phivere belongine exdnsively to the Cirat cimanel, whase members elected 24 from amone themsurs, and these latter again clected, ley haillot, ID if their own mumber, non Whon dabown tha riyht of apminting a doge. Selastimo Zami was the first doge thas elected, 1177: and on the wecasion of his clevation to oflice, he seatherel anomy amomy the poople, to eonsole theme for the buss of their riches an aet which
 reconised oustom, ats was also the case regarding the mantw in whin he wont through the ecremony of whatine the Ahratic sobe 'the Pope Alexander 111,, whom, during his gharrels with the Engeror

Froderic I., the duge had faithfully surported, sent him, ougether with other priviluges, is ring, is the symbel of domination the republic had acquired over the Adriatic. Accordingly, it marrage-ecremony took place on Ascension Dity-a ring beiner thrown fron the shij Bucentuu into the sea, to shew that as the wife is subject to her hushand, so is the Adriatie Nea to the repmblic of Pancer' 'Thu pactical hemring of the extmony soon apmared in the shape of stringent measures, regulating the navigation of the Ailriatio, and inposing tribute upon all foreign ships. The lewner of the duge mulerwent, in 1179, a signal modification; the Treble Quarantia-a high court of justice, composed miginally of 40 members-having been crected, as also the board of Adrogudori, for the settlement of itscal rquestions instituted. During the reign of Jacopo Tiepolo (129!-1219), a new restriction arose from the creation of an independent police, and a still greater one from the formation of a trilmual eonsisting of three inpuisitors and five correctors, who, on the demise of a duge, had to examine his combluct, sifting the minutest particulars of his private life. All these elanges were effected ly the Grat Conncil, to the thorongh exelusion of the prople. In 126s, the Great Coureil, in order to cat short all family influence upon the affairs of the state, levised a curious and extremely enmplicated mole of clection; but notwithstanding the linitations new and old, the power of a doge continued great, if he was only wise enough to prolit by the contentions between nobles and citizens. the disprutes of the different anthorities, and especially ly his own position as commander-in-chicf of the forces and high-admiral of the navy. This last prerogative of the doge remamed in vigow up to 1628 , when, ly a formal enactment, the doge was mohilited the exercise of such command, unless he were authorised by the Council of Forty. Other privileges, however, belonging originally to the dogate, were aboogatod or ciremoscribed long hefore this, and especially during the period IOS9-1311. Thus, at the instigit tion of the doge, Gradenigo, who was actuated by jealonsy towards the mighty family Tiepulo, the famous law of 'closing the Great Comeil' was passed, and by it the whole legislative and judicial power male the heirluom of those families whase names were inscribed in the Golden Book, or Liluo d'Oro. About that time (1309), ecclesiastics of any degree were declared unfit for political ur judicial functions. To counterlalance the influence of discoutented nobles, a pullic feast was institutedto come off yearly-at which the dore gave a dinuer to the iishermen, fraternising with them in testimony of equality. Shortly before Gradenimes death, that terrible tribunal, the Comeil of the Tem, was erected, which was to be the highest in the state, irresponsible, aul entitled to pass judgment uron the doge himself. In the meanwhile, the Great Council managed to get the functions, public as well at jrivate, of the loge circumscribel in the minutest way. It was ordered that the doge should not anoounce his accession, except to the princes of Italy; neither was he permitted the opening of disjratches emanating from the poles or from lrinces; the kissing of his hands, or laneding down in his presence, was strictly interdicted. Ile could not leare town, be possessed of real property abroad, or allow his children to contract matrimonial conncetions with foreign houses, ace pit donatians, \&c. He han to submit to the continued presence of two alrogadori, to be fined for the least mistake, and huar the exprenses of the ducal dignity from lis own purse. 'To all these restrictions and hurdens the doge declared himself liable on the eceasion of his corouation, by signing a docunent
healed 'I'romissione" 'The: state constume and retinue of the dore wre minutely indined, and a tribe: fixerl as his sadary. As a symbul of princely dignity, the duge woro a lurnem rap, :and hat the title of serenity: The erelentials of ambassathors were writurn in his anme, bat signcal by a suctetary of state, aud sealed with the arma of the remblice The muny was struck in his mane, but mat with his stamp or ams. All the mondrates med and saluter the oleg口 when he cane into ernacil, and the dowe rose to mone but to foreign ambastalons. Dis fanily was exempt from the jurisuliction of the

 statl-odicurs, and gondotiers in livery: Aftor the Wath of Aml. Damplo, 1354, on a duotion from tha comrecturs, the" three presidents of the ynamatia, :n 1 later six ministers, were joined to the six mivycouncillors of the duge, who. together with tha: ahove-named, has formed henceforward the so-ailend Signoria Seremissima. At that stage the rank of done could no longer lee an olject of ambition, and as carly as 10:0 a law was necessary to prohibit the dorge elected from resigning his plac! Ans. Contarini, 1367, accupted the proffered dignity ouly upon the threat of lecing declared a traitur to the comontry. In 1418 , by a law emanating from the Great Comeil, the dige was even denied the title of Signoria, that of Mlesscre lecing substituted insteal; at the same time he was dopriver of the right of convenine an arentw or meeting of the peoplo. With the fall of the Venctian republic, 1797, the dignity of doge also disappeared. There were in all 73 moges at Venice, the firat of whom, Anafeste (laoluccio), was elected 607; the last, Manin (Loldrico), 1788. In the Palazzo Ducale, the coldurated frieze of the doges is to be seen romed the Sala del Maggior Consiglio, exhibiting 72 portrats, and one sunce covered with a black veil, with an inseription, indiating that Faliero (Marino) was beheaded for high treason.
The repulsic of Genoa elected, after a victory gamed by the party of the people (1:30), Simon Phecanera for its first doge. He was electenl fun life, and with absolate power, of which. hrow ever, he allowed a share to 12 adermen (anzimi) the one half being chosen from the cittention (citizens), the other mong the nobili (undes). In the long run of centuries, the power. duration, and splendour of the ducal seat underwent freducut changes, arising from the vicissitules of the state and the hostilities latwenn the rombar and ariso tocratie prarties. A constitution for defining the functions and prerogatives of the doge was firmed in 1528, after the great rictory of And. I horia orer the French. Aeconding to this constitution, whith, with slight molifications. remaincel till the end of the licpmblie, the dignity of dose was of two ycars' duration, under restrictions similar to thase at Venice. The caudilate was to be a nolde, and at least 50 years of are. The loge presideat, with the right of veto, in the sittings of the "treat Crmancil, composed of ?om members, as allo in thuse ne al smaher one consisting uf lom. Those the com cils exereised the legishative pown. Whoreas the exentive was rested in the done, together with 19 gonemalori and \& procuratort, amang these latter hoiug always the doge retiring. During the time if lris goverment, the doge resildid in the state palace, where be was liafle to the stme restrictions and coremonies which wer in Hese at Varice. When, in 1797, Genoa was wechfied he the French. the dozate ceased to exist; in 1842, the Trenoese Republic leime conjointly with the Licurian, re-established. the chucal dignity was ance more resnscitated; luat in lsity, it
disapmeared for ever, the Requblic itself having been dissulvad.

In continental theolocy, howwor, $\mathrm{tl}_{20}$ woml is still used without implyint any arnsure Duemas (Ger. doymen) meanin: simply thetrines: and this is the case in our own expression, lumatie Themong, or I Mognatic, which is that lnamen of theolony that treals of the systematic arransement of the donctrines of Christianity. Ohk manes for the same thing were loci Theoloyici and Thenlomine Powitime.- The first attempt to give a comnecteal vinw of Christian doctrine was made in the :ide. by origen in his work De Principias. He wats followed in the the by Augustine, who in his lumk lde Inetrinue "heristiona, and whers, treated of the whale buly of doctrine held by the church, thom withont any very seimtific arrangement. The comtribations to Dogmatic. made in the 5th, Gith, and ith eantmins, wermere colluctions of 'sentances.' [n the Last. in the Sth c., the doctrines of the (ireek (hareh were treaterl by John of lamaseus in a form alrealy Aristotelian, and his work may be consilderel the first systematically arranged treatise on lhomatic. Whe makes no mention of purgatory. 11 is bouk was as inthential in the Greck chareh as the writings of Augustine in the Latin. The remular systematisnn of doctrines legan with the rimolames in the llth c., but degenerated oifen intor hair-splittins. The tirst eultivators of Donatio thenlogy :mones the sholastics were Hiblebert of 'Tours and Hhelard. who were followed by Petras Lambarius, Alexamder de Hales, Thomas Aquinas, Duns Fiontus, \&e.
The era of the leformation awoke Docmatie to a new life, leading it hack from Aristotle to bihlical theology. But the contruversies hetween the dillerent churches in the 17 the c ., and the tow sreat importance attached to Confessions of Faith, cramper anew its frecdom, and wive it asain a Scholastic turn. Many of our still stamias I treatises om systematic divinity wear traces of the fe fotters, and contrast strikingly with the: inderembence and vigour of inquiry displayed in the similar works of Nelanchthon, Calvin, and uther reformers. A fresh revial followed in Cermany the sprem of the critical philosophy of Kant, when hiblical theology rose up in contradistinction th the thenlosy of confessions, and dogmatic was grommed on the critical interpretation of soripture rather than on tralitional formulas. Ilenee, however, have spmeme widely diverging views. One party still lum fast ly the existing confessions; annther lonken chiefly to the contents of Scripture: While a third sulpected confessions and scripiture alike to the test of reason. Besiles these, there arose in more recent times, a school of dogmatic theologians, formed on the philosophical systens of dacobi and Nelulling, who looked for the issence of religion in the human sonl itself, and consitered Christianity as the historical revelation of it. Oi this schoml, shlelemaceler, and in some respects Neandre and Hothe also, may le considered the repecsentatives; ami of ald the Gemman schools, it is that which seems to be exercising the sreatest intlume on the speculative theology of Britain. The most recont impurtant work in this department of theolmy is Peter Lange's

of a saturated tincture, or taken into the stomach as a lowerful sulorific.

IOI'LEY, or DOILY, a staall napkin used at table for putting glasses mpon during dessert. Some are highly ornamented. The name is said to be derived from the origiual maker; but more proteably it is a modification of the Dutch dwoele, a towel, and was introduced along with the article from Holland.

DOIT, a small copper coin eurrent in Scotland during the reigns of the Stuarts. It was a Dutch coin (duit), and in value the 160th part of a guilder, which, estimated at 20d. sterling, would make the rloit equal to the eighth of an English penny, or half a farthing. By some authorities it is said to bave been worth only the twelfth of a pemay; in reality, it is difficult to say what was its Worth, for being imported, like many other coins of the period, from Holland, it would rise and fall in ralne according to the scarcity of money. The rloit must have been common in the early part of the reigu of James VI. The kirk-session of Terth (16th April 1552) 'ordains Tames Sym to give the witch in the tolbooth $S$ doits in the day" for subsistence.

DOIA ARRA, a vule ancient hatchet. They are represented on the columns of Trajan and Antoninus, and abound in all muserms. When made of hlint, which was their earliest and rulest form, they are ismally called celts (y.v.).

DO'LCÉ, an Italitn torm in music, meaming suftly aud with tenderness.

DóLCI, Cirlo or Carlivo, a celebrated paiuter of the Florentine school, was born at Florence in 1616. He received his tirst instructions in art from Jacopo Vigmali, a pupil of Roselli, and a remarkably skilful teacher. After an nneventful life spent cutirely in bis native city, D. died Jamary 17 , 1686. His works, which consist chictly of madonnas and saints, exhibit the character attributed to him. The faces are full of a pleasing and tender softness, which, however, is often carried so far as to rob them of all character: D.'s drawing is generally conrect, his colouring exquisitely delicate aud transparcont, and in the meety and laborious care of his timish be approaches the most characteristic examples of the Wutch sehool. ITis works are numerous, and senteral ner all Entope. Desides his malonnas, the most fanmus are his "St Cecilia,' "Christ Blessmo the Breul and Winc,' 'Herulias with the Fead of John the Daptist,' aud 'Clurist on the DLount of olives.'
I)OLE (Lat. Jolus, gmile), in Scotlind, the amount wf eonscions guitt of evil intention which is necessury to make a legal erime. A person incapable of ennsent is also incajnalik of nole-doli puctume, as it is techmionlly called. The correspunding phase in Englanl is filonions infent.
 IW putment of Jura, is miles somth-a ast of Dijum. It is selightfully situated on a vineyam slope: risiug from the right hank of the river Jonbs, and the convirons are tast, \{nll\} liad ont in garelens and promentwhes. The prineipal luilding is an immense cittheabal, namarl, in homona of the Virgin, yotre Jom". 'The chiof mambiatures of 13 . ate hosiery, tiles, putiory, whmical prodacts, and beer: there aro also irom-smeltinur firnaces, fomenills, and some tratu in coma, wine wood, mathle, and irons. I'oln 7.7.! I). is the /helk Seqmenernm of the Romans, af whorse proseluce kle rwass of two aqueducts, an amphitheatre, sovoral trmples, amm the "street' or
 lihine, still sive imdications. There are also tho
remains of a castle buit ly frederitk barlmrossa in the ISth century. 1). is likewise numorable for hiuving sustained several sieges.

DO'LE-FISHE semis to be that fish which fishar. men enployed in the north seas do of custom receive for their allowance, 35 ll len. VIIl. c. 7.

DOLES AT HUNERAIS; these are of great antipuity. St Chrysostom spealis of them as being Given to procure rest to the son] of the alecensed. On this ground, as well is on the seore of srennal benevolence, the practice of making gifts to the poor at funerals was common until emnpratively recent thacs; for it was continmed, sometimes on a mumificent scale, long after the custon of praying for the dead had heen abambomed on the intrombetion of reformed doctrines. Nielosls, in lis. Kistory of Leicestershire, speakiug of Strathern in Framland Hundred, observes of this usage: 'In 170), there were 432 inhabitants, the mumber taken loy the last person who carried about luread, whieh was given for dole at a funcral ; a fustom formerly common throughout this part of Bngland, though now fallen much into disuse. The practico was sometimes to hequeath it by will ; but, whether so specified or not, the ceremony was seliom omitted. On such oceasions, a small loaf was sent to cvery person, withont any distinction of age or circumstances, and not to receive it was a mark of particular disrespect.' 'These doles, whether in money or in articles of food and ale, were at one time common not only in limgand, but in Wales, Ireland, and Scotland; nnd the custom may be said to have represented, in a simple state of society, that form of benevolence which, in the present day, consists of bequests to hospitals and other public charities. By some writers, the custom of making doles at funerals is traced to the sin-offering of the Ilelrews. See lirund's Popular Antiruities, elited by Elhis.

DOLGE'LILEY ('date of hazels'), the eapital of Merioneth, North Wales, near the eentre of the county, and the laryest town in it, is situated on the banks of the Wnion, 205 miles north-west by west of London. It lies in a rich and pieturesque valley, at the foot of Cader Idris, and doring the smomer months is much frequented by Euglish and foreign tourists. It luas manufactures of coarse woollens and flanacls: its Welsh Tweed is in sreat repute and demand thronghout the kingdom; Iamb and kid skins are tanned and dressed; and in the vicinty there are fulling-mills and bleach-greens. 1'op. (1S61) 2050. Here, in 1404, Owen Glendwr lichd a parliament, aud signed a treaty of allinnce with Charles king of France.

DO'LICHOS, a genus of plants of the matural onder Leguminose, sub-order Papilionucter, elosely allied to Phaseolus (see Finsey Bens), aml chietly distinguished by the extension of the base of the standard so as to embrace the wings of the corolla at their base. The genns inchules a eonsidurable mumber of speeies, some of them shrubly, some ammal, and some peremial herbaceons plants. Some of them have leantiful fluwers, and some of the herbaceous species are cultivated on aceount of their seeds, which afford a kind of pudse; or of their young pols, which, like those of the Kidney Bean, are boiled for the table. Among these are D. Lablab, a native of India and Egylet (which has been made the type of a separate genus, Lellab); D. Nankinicus (or Lablub Nankinicus), a Chinese species; D. Lubia, a native of Egypt; $J$. scspipedalis, a native of America; D. Solu or sioja hispilla (the Suy Bean), U. Catian!, and D. uniflorus (Horse Gram), natise's of India; D. sphutorospermus (Calavana or Black-eyed lea), a natire of the West Indies, In the climite of britain, eren the mest
hardy kinds rorguine the idid of is little artifieial heat, and they are reckenmi inforior to other kinds of pulse or garmen vergetables of "isicr cultivation. "I'he well-known thmess sanace or ketchnp callod Soy (if.v.) is male from the Soy bean. Allied to D. is the genas finnevalif, to which belong the Sworn lieans of lmlia. E'. gladiate, the commonly cultivated specins, las puris two feet lons. Another allied penns is P'srohorarpus. 'Ilwe Eecods of I'. tetregonolobus, formerly 1). tetrafonolwhas, are used in the Minuitins as pas are in liritain; and its porls aml tuberous roots are common ladian csculents. Some species of Pochbrhizus, also an allicd genus, we remarkable for their fubcous routs, as $I$. ongulatus (formerly D. bulbosux), a native of India, now eultivated in Sonth America amd other warm countries, which produces pleasant tumip-like tubers; and I'. rilobus, which has tuburs two fecet long and nearly cylindrical, much used as a hoilul vegetable in China and Cochin-China.

DOLL, in imitative baby used as a toy by girls. The word dull is of doubtfal derivation; possibly from idol; in French, the name is ponume; in German, puppe, from Lat. pupu, a girl, i doll. The use of dolls dates from the most remote times, and is common in all countrics, barbarous as well as civilised, lecause it springs from that love uf nursing and fondling infants which is implanterl by mature in the female character. I'reciscly as it child in a puincely mansion in England fondles it fincly dressed doll worth a ginea, so does the child of in Africin or Esquimanx take delight in a piece of wood or bone carved rudely in the form of a haby-in fact, girls in the humbler ranks may sometimes be seen hugging ond talking to a bit of stick decorated with a few rags, as if it were it live child. This is not the place to discuss this curions psychological phenomenon ; it is enongh to say that the luve of dolls is a perfectly legitimate feehns, and its excreise helps to cultivate not ruly tender aflcetions, but taste as regaris the making and management of children's dresses. Aceorlingly, the keepirg of a cioll becomes a part of the home-cdncation of girls; and is recogmised to lie so by the universality of the practice.

As in the ease of most other Tuys (i. v.), dnills were at one tine imported into Grat Inritain elnelly from the Nethorlands; and hence not an ammsual name for a doll was a Flander's baby: 'These old Flemish or Duteh dolls were made of wood, with neatly formad faces and flashy dresses, the chanjr kimuls laving slendor wooden le,gs. Lattenty, there have locen grat inprovemonts in the making of dolds, and in England it has assumed the elnatocter of a manufacture; but there are still large innurtations from the conntries on the lihinc, france, and Switrerlamk. In these contimental conntries, women and chililren are mostly enisated in the manuficture. Sume carve the leats and homies, others faint the fitees and necks, whers frepare logs and amons, aml a different class cut out, sew, and pht on the dresses. 'These operations are seldnm executed in one maunfatory: Usually, dealurs boy the fraguents so fiar prepared by villagers, and wet them pat tomether in a wholesale way. As the time employed in the preparatory froeesses is searcely of any marketalle valum, the prices of framments we most insioniticant. Hence, as resarls all the cheap kinds. with painted faces and rawfets, dulls ean he imported at a cost luelow that at which they could be executed hy hand. labour in Enylamd. Whan, lonwerel, we come to dolls of is smperion kinm, with notulded wax or composithon faces, arms, aud fect. glass-eyes, stuffed bonlies llixcm rimertets, and gauze dresses, the English, by their mathinery and eapital, carry off the
tratc. $l_{n}$ Lombun, in 1861 , thitre were twenty three dull-makers, of whom one male them from guttapurela. He this as in otloer trales, there is an economic division of latwor ; for example, there are dulls' lead-makers, dolls' Iecs and arm makers, dull sewers, doll stuffers, dolls' wig-makers, dolls' eye-makers, and doll dressers. tror some dresses, rimmants uf ealico, ganze, silk, and other materials are poenrel from shopes ; hut for fashionably dressed dolls, muth in demand, it is necessary to buy goods on a large seale. The extent to which dolls glassuyes are manfactured appears surprising. Some years ago, in evilence betore a ernmmittee of the House of Commons, is gass-manfactmer at Birmingham stated that he lad received, at one time, an "rder for $\dot{L} 500$ worth of clolls' "yos. The cheaper dolls' eyes are simply small hollow glass-beads, made of white enamel, and eolomed with black ur bloe, but withont any attempt at variety or eflect: while those eyes of a hicher quality have a rines of colnur to represent the iris. The introduction of wres and mechanism to make the eyes move or wink at pleasure, and alsu to cause the doll to utter the sonnds 'papat' and 'mamaa," have been highly apreciated steps in anlyanee, with a corresponting rise in prices. It is statel in the expe ritnce of the trade, that since Victoria came to the throme, Hue eyes for alolls have been in the asecndant in Enghand; but that hack eyes find the Just maket on the continent, especially for Stranish dolls. Hlack dolls are male for expert to America, whore they are in request by girls of negro parentage, and the intruduction of gutta-pereha is farouralile for this brauch of the trad Composition-heads are umally made of propier-mithé, cast in a monde, and waxel and painted to represent the features.

One of the must attractive stalls at the (ireat Exhilition in 18.31, was that which contained the dolls of Narlame Nontanari, a Tondon mannfacturer. Fuferming to this stall, the Jury lieport said: 'It consists if a series of dulls, representing all ages, from infancy to womanhool, arramed in several family groups, with suitalile and elegant mordel fumiture 'these dolls have the hair, eyelashes, amt eyelids separately inserted in the wax, and ar. in other respects, molellow with lifelike truthfulness. Alneh skill is alsu erinced in the variety of expression whath is riven to these figures, in rergard to the ages aud stations whicl they are intended to rumesont.' some of those dolls were solal at five ghincas undressed ; and at a greatly increased price When richly attired. The same exhibition shewed how much shill is now excersed in makinus ras(his)], in whieh almost every part is formed of textile materials.
 the numetary system, of the [nitm] States. Thwe origin of the name lescreses motiee. Joller is a varicty of the (ier. thater, Low Gor. dabler, Dith. alutri: :und the word canue to signify a coin thins: Abont the end of the lothe, the lomuts of Sichlick -omed the silver extracterd from their mines at Juhblims-thal (omachin's Valley) into ounce-pitees, which reacived tho name of Joachims-thaler the Gier. aljuctive from the name of the rlace ('lusthims-ditlors,' as it wore). His two suns cintimued to carry on the business with great requatation and sucerss.

DO'LAX SHOP, the name pepularly wiven in Iomon to a shop, where rags and other kinils of ohd articles are bonght, and wer the dow of which a hack doll is usnally suspembol. It is numerstmen that dolly shops are in many mstances a kind of malicensed pawhoroking concerns. For small artielne. a few funct are given, on the understanling that the seller can loy them lack at an ulyane some days after. In Edinburgh ant Glastow, shops of this kiml are known as wee pouns, and give som. concern to magistrates and price.
DOLMEN, the name given in France to what Iritish archaogists call a Cronment (q. v.). The dolmen, property so called, cminsists of one laris muthen stone resting on two or more unhewn stanes filaced erect in the earth. But the name is somm times applied to structures where several blocks are mised upon pillars, so as to form a sort of grallery. One of the most remarkable monuments of this kind is the Piorre Couvert, about a mile and a half from Sammur. It is 64 fect long, about 15 fret wide, and about 6 feet high. It las four stones on each sithe, four on the top, and one at each end. 'The stome at the east end has fallen down ; all the others appar to be as they were originally phaced. Some of then are of great size, one on the romf measuring -4 leat in length, and more than: feet in thekuess. All are of the sandstone of the neighbomenow. The Hour is umpaved. Dolmen is believed to be a Celtic word, signifying a stone table. The monuments to which the name is given are supposed to be the sopulchres of the ancient C'elts or Crauls.

IOOLOMITE, BITTER SPAR, or MAGNE'SIAN LIMESTONE, a mineral consistine of Carbonate of Lime aml Carbmate of Marnessa in somewhat variable propurtions, smactimes nearly equal, the carbonate of lime often greatly pre proderating; and usually containing also a little -sometimes nearly 20 jer cent.-of carbomato of iron. It is softer than limestone; usually whito: sometimes gray, yellow, or brown; anil necurs compact, cellular, or porous, granular, foliated, and crystallised. Its crystals are nsually rhommindal, and its cleavage is rhomboital. It is readily dis. tinguished from limestone by its feeble effervescence in aculs. It uecasionally occurs in veins accompranied with quarts, calcarenus spar, \&e.. hut also as a rock, and forms mountain masses. It is nften usel as a mikhing stone: the new Houses of Parliament are built of it. It is also burned and made into mortar. but the lime olitainel from it remains much lonere caustic than lime from common limestone; ant if spread on land in the same rquantity, imprairs rathor than increases the fortility of the soil, seening to burn n], the vegetation. the erommon D. (I) dellinis), with which the wern confometed. They are wry voracious animals, and are said to prey not mon on fishes, mednsat, whalopmels, \&c. but erem on the wombed and fedile of their awn spectus. They live. lowever, in herds, wheh often delight the myager in the ncean solitule by the gambols which they perform aromed his ship. 'They may lee discerned it a great distanee; as they are continually leaping from the surface of the sea, an action which, as it secems on have no whions abject, is probiblly the mern exaberance of amimal mirth. Whan a shonl is seen thas frohilline at the distance of a mile or two, in a fow numents, laving caurht sight of the ship, llowa they cance tronping with the velocity of the wimb. When arrived, they display their antity in a thonsami wraceful motions, now leapone with curvel bulies many feet into the air, then dartiug throurh a waye with ineredible velocity, leavimy a slemter wake of whitening fuan under the water: now the thin back-fin only is exposed, cutting the surface hke a knife; then the broal and muscular tail is chratel as the anmal phnges perpendicularly down intor the depth, ar dives beacath the keed to explum the "pposite side.
The 'manom 1). is from in the Nerliterranean and in tha Northern Atlantic Ocean. It is usually not more than 6 or $S$ feet long, hat indirnduals have
been seen of 10 feet. The body tapers towards the tall. The tail is crescent-shaped, and abont a foot in brealth. The beak is about 6 inches long. The how-hole is crescent-shaped, with the horus dirceted backwards. The colour is Hackish on the back, grayish on the sides, and a satiny glistening white beneath. The female D. brings forth a single young one at a time, which she suckles and nurses with great care. Atthough an inhabitant of the ocean, the 1 . emits a peculiar murmuring or suppressed lowing ery. The flesh of the D. was formerly considered a delicacy, and sailors still regard the capture of one as a happy event.

From the fom of its lieal, the D. receives from the French the names of Bee dow (roose-beak) and Vie de Mor (trouse of the Sea). It was very Miferently regarded and designated hy the ancient Gireeks: it was their Hieres Ichuthe (sacred fish). was invested with many fabulons attributes, and was the subject of many mythological legenus. It was supposed to be peculiarly friendly to men. It was sacred to Apollo, who was worshiphed at Delphi with dolyhins for his symbols. The figure uf the D. (see accompanying illustration) appears on many ancient coins and medals: it is said to have been borne on the shield of Uyyses ; it early appented on the shich of some of the princes of France. and gave its name to one of the fairest of the Trench provinces, from which the beir-apparent of the French throne came to be styled the bauphin. It is not easy to account for the high regard in which the D. was anciently held; nor is it altogether easy to expain the very general transference of its name in nowdern times to the corychene, a very different creature, remarkable for those changes of colour in its dying moments which puets have delighted to celelrate.

Of the other species of 1), one only occurs, am that hut ravely, in the British seas, the Fottle-nosed 1). ( $L$. Tursio), which is saild sometimes to attain a longth of 24 feet. it arpears to belong to the northern parts of the worli.

Dolphins not unirequently enter the mouths of rivers. A dolphin of the Arctic Ocean ( $D$. leucas) ascends into the fresh water of the Ohi, to prey mon the ascending fishes of various linds.
bolpilin, Black (Amhis fubue), a species of Aphis (q. v.), or plant-lonse, which infests the

Thack Dolphin:
$a$, a coiong; $b$, a winged insert, magnifled; $r$, a winglens fomate, magnifict.
iwne and aften hows consideralle injury to crops, surkime the juices of the plants and preventing the
development of flower-buds. It is of a rlull, black, or dark-green colour, the young spotted with silvery white. The first that appear are all wingless, but by and by winged individuals are produced, and the pest spreads with great rapidity. It is in the succulent tops of the plants that the aphides first appear, and a common practice of gardeners is to remove the tops in which they are observed.

DOM, or DON (from Lat. dominus, lord). This tith was originally assumed by the popes, from whom it descended. in France at least, to bishops and other dignitaries, and finally to monks. In Portugal, the title rlom is confined to the sovereign and his family. The spanish don was originally confined to the nobility, but is now bestowed by courtusy as indiscriminately as the Enclish Mr or gentloman. The feminine doño is, in like mauner, given to ladies.

DOAL-BOC, or DOOM-BOOK (book of dooms or sentences, liber julicialis), the code of laws compiled by King Alfred, chictly from the West-Saxon collection of his own aucestor Ina, bnt comprising also many portions of the Kentish collection of Ethelbert, with the supplements of his successors, and of the Hercian laws of Offa. 'Ina's collection,' says Dr Paul', 'was the ouly one received entire into the Codex, which was chiefly applicable to the condition of the West saxons. A few articles werc admitted here and there from the Kentish and Mercian laws, lut research into this matter is not possible, as Offa's book is lost.' Alfred made few if any original laws, but contented himself with restoring, renovating, and improving those which he found alrearly in existence. The West-Saxon dialect had become a written lunguage earlier than any of the Teutonic dialects of the continent; and as the power of the clergy in Saxon England was of a more limited kind than elsewhere, the Laws of England, $n_{1}$, to the period of the Norman Conquest, were almimstered in the vernacular speech of the people. Alfred's peculiarly Christian character is strongly impressed on his code, which begins with extracts from the Bible, 'The Lord spake all these words, saying, I am the Lord thy God. Then follow the ten commandments, the part of the Mosaic law relating to criminal offences, and passages from the New Testament, including the golden rule. Yet it should be observed, that these extracts prove not the peclesiasticul, but ouly the scripiural character of the Dom-toc. The code was ratified by the Witan, as Alfred expressly informs us. In addition to Dr l'auli's life of Afred, now pullished in two English translations, the reader is referred, for information on this subject, to Thorpe's Introduction to Alfrelt's Laws, in the Ancient Laus and Institutes of England, i. P. 58.

DOMDROW'SKI (poperly D, DROWSKI), Jan Hankyk, a distinguished Polish genema, was born〇9th Augast 1755, at l'urszowice, in the district of Cracow. ILe entered the service of the Elector of Saxony in 1750; hut in 1792, on the first symptoms of the insurrection in I'oland, proceeded to Warsaw. He took part in the l'olish campaigns against Russia and Prussia, and cxhibited such remarkablo military talent, that on the termination of hostilities, Suwarrow offered him omployncnt in the Russian service, and I'russia made lim is similar offer. Both were refused, and 15. went to France, where, in 1796, he was commissioncel by the Directory to form a Polish Legion among his exiled countrymen, of which he was apmintes commander. The legion brilliantly distinguished itself in the Italian cempaign. While in lome, the admirable discipline which 1 . preserved awong his troops, raised hion so high in the
estimation of the Semate, that it presenter him witl the standiads which his great comatryman Sohneski late taken from the 'lugles, whes les eonnulled them toraise the siege of Vicmat, and which he had sent tu the church of sian Lorctor. In the cinapaign of $1799-180 \%, 1)$. silve splenmid prows of his comarge After the peace of Amicns, D. bectame ab sumeral of division in the service of the cisulpinn Refunlie; and after the battle of Jena, alony witl Wybicki, he was ordered by Napoleon (lsilif) to summon lis countrymen to amms. His entrance into $1 V^{\text {a }}$ arsaw, at the head of twelro Iolish divi. sions, resemhled a clatssical 'trimmilh.' At birscham and Friedland, he won fresh laurels. In the fatal Iussian calupaign of 1810 , he commanded one of the three divisions of the lifth rome d'armét, anm at the passage of the Beresina, sivet from destruction the relics of Poniatowski's eorps, $\ln 1813$, at the Jried of his Ioles, he took an lonnomahle prart in Whe lattles of Teltow, Grossheseren, Jiterhogk, and Leipsic. After the fall of Napoleon, D. returned to J'uland, and in 1815 was apmointed by the Emperov Aloxander a general of carahy and l'olish scmator; lnt in the following year he withdrew from public employment to his estate in the duchy of I'osen. Ie died 6th June 1S18.

DOMIS (Ital. ditomo). Though often used s.tnonymously with Cipola ( $1 . v$. ), a dome, in the stricter sense which it has obtained in the languares of Northern Einope, signifies the external part uf the spherical of polygonal roof, of which the cupela (cupo, or cup) is the intemal part. In Italian usacre, however, it has a wider siguilication than even llee first, being userl to denote the cathedral on chief chureh of a town, the house (donus) par eacellonee, or house of God. The cause of the name of the bunding being thus applied to the form of the ronf which covered it, arose from the fact, that the chicf churches of Italy were at one period almost universally so roofed. In tracing the listorical oricin of the dome, we are usually in the habit of regarding it as originating with the architecture of the Lastern Empire, because it was at Constantinople and in the Byzantine provinces that it was first enaployed in ecelesiastical sthoctures. But it was the Pomans who, in reality, were the inventors of the done, as of all the other applications of the semicircular arch. Of their success in aplying it to large lmildings, we have atoundant proof in the ancient domes still to be seen in Rome anil its neirghourhood. The rome of the I'antheon is still probalby the most magniticent dome in existenee, and others of smaller size are to be seen in the temples of Fiacchus, Vesta, Tomulns, Hercules, \&c. 'From Rome it went to Constantinople, and from the same source, also, came the few insignificant attempts at domes in the Western Empire.'Tergusson's Mendlook of Architectare, ii. 243. The external form of the dome of the church of St Sophia at Constantinople, which became the typical Christian structine of the kind, will be seen in the illustration appended to Byaantine Arcintecture. See I'Antireon. The dome of San Vitale, at Ravenua (cl.v.), is said to be still more ancient than that of San Sophia, and is a very remarlable structure of the same class. On the church of Sit Marco, at Venice, there are no less than five domes, the centre one, as is usual, heing much larger than the others. The interior of these domes is corered with Mosaic (q.v.). So far from being peculiar to the few churches we hare mentioned, domes oceur in the churehes of almost every town along the western shore of the Adriatic, ind form, in fact. the chicf architectural feature of this side of Italy. The construction of domes in modern times was reviver in Fome, lyy the building of that of Our Lady of

Lorote, in 1507. Inent the three most celebrated
 lionse, of st F'anl's (q. s.) in loman, fanl of the l'anthoon (y. v.) in l'arte. A very completro article on dennas, which has been rambenseal in the Irmmy Cychourdia, will be fomma in the Lincyrdopede M解hodique, mader 'Architecture.'
 a celehraterl paintor of the bolucrase selume, was born in loologna, losi. He began his stnolies ambur D. Calvarer, and completed them umber the Ciaracio Durines the whole of his carear, ]' land mond to suller from the jealonsy of rivals, whon are not free from the ruspricion of having cansen] lis death by prison, 16t1. IIs frescoes are (istmenished by canrectness of design, soft delicacy and freshomes of colour ; tho heads of his figures, in praticular, at: remarkalbe for expressive force. The masturpura uf 1)., the 'Communion of St Jerome' (in tho. Vatican), though sugcested by Ag. Caracci's, is a sublime production. The 'Life uf the likessed Virgin,' and the 'Cure of the Demoniae Boy,' are of expuisite beanty. Ont of ltaly, the Insenm of the Lounce possesses the larrest number of 1 ."s worts.

DO'NITSDAT BOOR, or DOONSD.AS BOOK゙. the mance ne one of the ollest and most valnalle recorls of England, containiug the results of a statis. tical survey of that country made ly Willian tho Connperor, and eompleted in the year 10s6. Tho origin of the name-which seems to have been given to other records of the same kind - is somewhat uncertan; but it has obrious reference to the supreme authority of the book in doom or judgment on the matters contained in it. 1t was anciently known ly several other names, such as the Liber de II intonia, or Book of Winchester ; and the Rotulus Wintonid, or Fioll of Winchester, because it was it one time preserved in the royal treasury in that city; the Liber Regis, or the King's Book; the Saripfura Thesauri hegis or Recorl of the Ning's Treasury (where it was long kept, together withs the king's seal, moler three locks anil keys): the Liber Censurlis Arglice, or Rate-bock of England.

The war in which the survey was matis will lue best ilescribed in the words of the contemporary writer in the Anglo-sixon Clmomele. After relatin"s how, in the year 10s.5, Emeland was threatenel with invasion fron Denmark and Flanders, ant how king Willian nepared for its defence by laying waste the sea-shores, and by raisine the largest army that harl ever heen seen in the island, - hilleting the sohbers ${ }^{10}$ bon his suljects, every man accordin's to the land which he possessel, the annalist soes on to say that at millwinter, when the ling was at Eloucester, "he had a great consultation, and spoke very deeply with his witan [i. e., great commed or parbiment] concorning this land, how it was held, and what were its tenantrs. He then sent his men all over England, into every shires, and cansed them to ascertain how many humiral hydes af land it contained, and what bamls the king liwl in it, what cattle there were in the suvoral comuties, and how much revenue he ought to get yearly from each. He also cansed them to write down how much land belonged to his archhishops, to his hishops, his abhots, ant his earls, and -that 1 may be lirief-what property every inhabitunt of all fingland possessed in land or in cattle, and how much money this was worth. So very straitly dirl lse cause the survey to be made, that there was not a single byde, nor a fardland of groumi, nor-it is shameful to say what he thought nu shame to do-was there an ox, or a

## DOMESDAY JOOK.

cow, or a pirs passed hy, and that was mot sut down in the aceomets, aud then all these writings were lromeht to lim.'
'Ithe survey was male lyy commissinners callod the Kiners Justicharies, who seem tu have hat the help of the chef men of every shine. By a sworn itsize or jury of the sherills, lords of manors, presbyters of ehurehes, reeves [i. c., grieves we oreseeme] of lmudreds, bailiff's, aud six villeins [i. ce., tenants at will of every villase, they mate inguent as to the name of the place: who held it in the time of King Elward (1041-10fit) ; whowas its fresent pussessor; how many hydes there were in the manor' luw many plonghontes in demesue [i.e., reserved in the lort's own hamel] ; how many lomacers ur viassals: how many villeims; how many cottars; low many seris; what fremen; low miny temants in socese [i. c., tenants by herelitary right]; ]
how mach mearlow and pasture; wlate mills and tish-ponds; how nunch latel heert anliled or taken away; what was the gross valne in King ledwarl's time: what was the gresent value; and how much wach freeman or sue-man has or had. Of all this there was to lee a tlueedend return or valuation: 1. As the land was hed in King Elwaet's days: 2. As it hat buen given ly king William: 3. As it stoon at the time when the survey was mude; aurl the furors were to say inther whether the value conkl now lo raised.

The returns thas eathered in the several shires, and their humbrems and ather sublivisions, were arranged and digested in the record which is now ealled the Great on Exchequer Domestay. The enmmeration of the cattle and swine, which so movel the indirnation of the Anerlo-saxon chronicler, was omitted from the record, dimbtless leeause the

DoMESTIC! ANMMALA are those whith, in arder to turn them to his nss, man las tanem or redued in a greatory or logs moasme fom tharir matural wihherss, and which he makes tho momets of his care, and in a livines stath his promerty, hany animals are nseful to man, whinh he has mever thus appropriated. Sheh are the der and other gane which the hunter fursons, imi dishes gemeraty, Whether of the sea, lake, or river. Mas has not ritt fomm it prossible tor dumesticate them. ar has not fomm it necessary or desirable to do so. Indivimals, inded, of some suedes may have heren domestieated, and beome very tame, hat these are exceptional instanes. In general, thense only are called humestic anmals which have existed from one reneration to another in a state of domestreation. Of almost all of them, domesticated races exist, consinterably different from any that are now fomm in a state of nature ; the peculian circumstances in whish thay are phaced by domestication expresing in modifying intluener. like that of cultivatom in phants. Domestic animats mostly belong to the classes of Mammals and Birds. Of mammals, those which have been domesticated are exclusively of the eommon quadruped form, aul mostly herhivorous. The greatost number. and those anmeng the most important, lelong to the order of limuinants: somse of them loeng valualle for their thesho their mith, their hair or won, thoir hide, de., of als heasts of humben and of dransht, some won om all these accounts. To this order holong the wx, butfolo, and yak, the sheep, the prast, the reiutere, the camel. and the llama and alpaca. Of other hertiverms guadrupeds, the most important aro the horse and ass. the elephant and the hog. (If the elephant, howeser, although for many ares it has ben much employed for varions 1 murnises in India, no dumesticated race exists; the individuals which man reduces to his service, locing still taken as at first from anomg the wild denizens of the forest. Lennesticated races exist of two compratively mimportat quadrupeds of the order of Renlents, the rabbit and the cary or Guinet-pig. - Of carnivormes fuadrupeds, there are only two which have been generally and thoronglaly domesticated, the iog and the eat. The uses to which these anmals are destincl are very different from those in order to which herbivoronis quadrupeds are kepet in adomestic state. Analugons to one of the uses of the dog is that to which the chectah or hunting-leopard is appled by some of the princes of ludia, hut like the elephant, it is only individually donesticaterl. The same remark may le made concerning some other anmals the otter, the civet, 踝.-which in ilifierent countries are tamed or keptin in confinemant to meet certain purposes for which man finds it convenient to employ them. The domestication of the ferret is rather more complete. - Of birds, the most important domestic species belong to the gallinaceous order, and to the fanily Anatider among wel-footed birds. To the former belong the common domestic fowl, the turkey,
the parock, the Guma-fowl, \&e: to the latter, the poose, duck, \&er of wher bieke, nome ran

 mily in the sanm semsu als tha chantala ; hat it is ant
 mak. Inoth Direls and laonts of proy his so ryents.

 of fresh-water hish arm to a merain extent the (1) jincts of cere amd of a lime of coltate on the fret of man-In the fower divisions of the mimal kingelom, ondy a fory spedies ever merive such cultine, or in their hancs state are clamed by man as his property. All thesu belong to tha class of insects -vize, two or three species of bre, two or thereg sprecies of silk-wommoth, and two or three parcios of conchincal insect. 'Tlows may furhars mome fitly be doseribond as cultimatel than as domestiontod.

Nany ammals wot yet domestieated, meht frohably be added with indvantase to the mumber of donuestie manals. Alaptation to particular climates and stations misht probably he foum to recommend species allied to those in which great part of the wrodth of menkind has loner comsistol, and from which still more of it has lar 11 derivel. It is not impusilde. also, that as the waste places of the world howne peonded, animals abraly locumang seare, may be advimtageonsly domesticated on aeconat of their fur or ather probncts fir which the $y$ are now fursucd ly the hunter. - "llae priucipal domestic animals. hovever, of the presont day, have been domestic ammals, and highly valued as such, from time immemorial. We have na recond af tha domestication of the ux, the horse, the eamel, the doge \&c. Even the llanamel apmea, although kiown only to the inhabitints of the Aurles ani adjacent regions, were fond in a state of domestication there when sinth Anerica was tirst visited by Europeans, and their subjection to man is mobahly to he referrel to the carbest periods of leruvian civilisation. The Imatation of some donnestic aminals to particular comotries and climates- of which we have notalde instances in the camel of the Asiatic duserts, the reindeer of the aretie reginns, the yak of the steep and show-edad Himalaya, the butiato of tronical marslines, and the South Aherican qualruped just mentioned firbid us turmpuse that all the imuratant domestic anmans were domesticated by the same pronse and at the same perion, on that they have all sjoread in a state of domestication from a common centre or sonrce. Yet there are many circmastances which point to the same Asiatic region as that in which the ereater number of them were first domesticated. which is commonly regardenl as the crable of the arts and sciences, and even of the homan race.

HOMESTHC ARCHITECTCHE, Jhe extemal forms aml intermal arancements of the domestie ahodes of a perple are far more intheneed by their manmers, habits, and ncoupations, and by the climate in which they live, than their ecclesiastical cdifices and public buidings: and there is, consequently, no department of architectme which is so varied and national as dumestic architecture. Thit not only are the circmastances of eadl country diflerent in this respect-the same is the eabe with every departmont of each comtry, with every town in each department, with every street in each town : and a domestic architecture which fulfils its object, will not only adipet itself to the necessities, but will make
the best, in point of artistic effect, of the specialties of every case with which it is called upon to deal. The circumstances of families, and even the tastes and fancies of individuals, are legitinate sulbjects of consideration in domestic architecture. To attemp to give to domestic architecture the beauty of uniformity, is consequently to mistake both its object and the source from which its charm is derived. When attained at all, uniformity is attained not in accordance with, but in detiance of, the utilitarian olijects of domestic arehitecture. The results of this artistic falsehool may be seen in the monotonous and meaningless streets aud sruares that have been built in all our principal towns during the last eighty years. The legitimate charm of domestic architecture, because the only one which ean arise from the complete fulfilment of its oliject, is the charm of variety. It is the charm which our ancestors sourght during the whole of the great architectural periml of the midhle ages, and which our architects, who in this, as in so many other respects, are returning to their principles, are now begiming to cultivate. But here, as in all similar cases, it must be horne in mind that, in general, it is the principle alone that can be revivel, and that the details hy which it was carried wat can be legitinately copied only in the exceptional cases in which circumstances and the objects $t$ o be attained remain unchanged. The position of an Englishman in the 19th iliffers in many respects from that of an Englishoman in the 14the.; and to construct for the former a honse in all respects resembling that which was constracten for the latter, would be to commit an error the same in Find as if we had songht for either of them a moldel dwellines in P'ompuii or C'anton.

An account of the forms of English honses from the 12th c. donnwards, will bo fond in Parker's Ghowtery of A chutucture. A jart from nur own earlier examples, the forms of domestic architcecture most suggestive for Iresent use in this comentry, are those which are to be fomm in such wonlerfal beanty and varicty in ahost all of the ohder continental towus of the north of Europe. It was from the domestic architecture of France and the Netherlands that that of soutland, at its bust period, was mainly berrowed; and if we wish to inprove it now, we can scarcely do better than resert tolts original source.
DOMESTTC MANAGEMENT, financially considered, may be nefineal as the art of making a given income go the furthest possille in procuring for a family the nuans of lising-the worl heing being understood in its wider and higher sense. It heing assumet, as a fumbanental maxim, that the ontlay shall be within the income, the lealing oliject of the art is, rightly to alportion the outlay amoner the different reyuisites. How this is lest to be done. can be disempered only ly large experience; and if a young housekener were to begin her career without some inlications of the path she shoud follow, she must fall into serious mistakes, occasioniner lows aul discomint. Not that any amount of previous instruction, whether written on (ral, can give the skill of expratace; but attention to some of the more important maxims may help to awert very serious (Thers whild the lasoms of exprrience are locing leamel. liy way of outlin chats for this rather intricate mavigation, we sive lore four sebemes of hombumb expuditure, lasem upan experience, and adapend to sombe of the more extonsive chasses of the britush ommmonty, prefacine the selomes with a

It in a wory safer ruln, that the best quality of fome is the wheapst in the mal; 'it goes further'-i, e.,
 (1) mantise monmony maty, by wing to market themselve, purchase good meat int a cheaper rato than
they would if they sent for it, from reasons known to experienced buyers, such as the pieces they select not lieing called prime cuts, nut bemy so well shaped, \&e., which in no way takes from the wholesomeness of the article. Again, gool cookia? renders things more digestible and nourishing; bal corking is absulnte waste, to say nothing of the injury it does to the stomach. How meat is rendered tender by boiling ar broiling, without having its nutritive fualities extracted, is described in the artiches bohling anil Brollivg. For the time necessary for roasting, laking, stewing, and frying, good instructions are wiven in the very useful works, The Dictionory of Daily Wents, and Mrs Beeton's Bw, of Household Management, where not only the monle of cooking, but the actual cost of each dish, is given.

Some hooks on housckcering recummend that Coal should le bought when cheap, and that froceries should be purchased in large quantities; but this is open to the objections, that coal occupies a larger space than can be spared in small houses; that many articles of grocery waste in quantity or deteriorate in quality by keeping, as sugar, which loses weight, and tea, which loses aroma; and that both coal and grocery in masses, are ait to be wasted by servants, chillren, and thoughtless $l^{r e r s o n s}$, from the circumstance of having large yunntities to go to. Groceries may be boughe elnaper in this way, and it is only personal experience that can decide in every case as to their being really cheaper. Cancles and soap are the chief things that certainly improve by keeping. Candles should be hmar uln, if dips; but moulds should be stored in hoxes, and covered and kept in a dry place. Soap bought in hars, in as lly a state as possible, should he cut in hunps, six to the bar, and lad on shelves, to harden slowly.

A thorough knowledge of the art of choosing material for Clothing, and making and cleaning articles of apparel, is also highly necessary, and, lake good marketing for food, can only be aequired by practice. Many things must be considered in this kind of purchase; the evenness of the threads in cotton and linen fabrics, softness of texture, freedom from what is called 'dress.' In printed goods, the same rule is to be observed as to evenuess of weaving, in aldition to which, those kinds should be selectel that lave the pattern printed through, so as to shew on the wrong side, and of a lilac or diark-line colour, as loing the best for washing. Flamel goods should be chosen for their remular make, goonl width, and softness; and tlannel articles slould he made larmer and longer than necessary, to allow for shrinking when washed. (wod patterns for making from should be obtained, well-titting and appropriate dress lasting longer, and looking leetter than what is jut together in an inconsilerate, slovenly manner: a cherr neealewman, like is clever conk, is the most traly economical one. Tho same remarlis aply to furniture-ehintzes an! linens for sltectings, ise. Articles chosen for glare and show, without reaged to their being in keeping with the general style of the romin or louse, of a tlimsy, irrequar, or ill-printed make, must certainly turn out insatiofactury ant wast ful.
The acompanying seabes relate to priees in Jondan that of her large binglish towns, amd reckoned on than allwwane of a hat and a half of bread (weighing fom pommeds to the loaf) for each indiyidual. Gount rhildren consume less leread than full-grown frrsons, but they requive nore milk and sugar; therefore the seale cean toe equalised according to cirrmastaners. Pudlings and vegetahle food for the wihlres must also inthence the amount for butcher's meat. It is supposed in these scales that

DO'MICILE, a man's legal place of abone, or the place which the las will hohi to be his residence. In determining questions of domicile, so often surrounded by difficulties, the law endeavours to follow the facts of each case, and, conseprently, the legal as well as the natural view of the matter is expressed in that definition of a dumicile in the code which siys, 'every man has his dmmicile where be has placed his hearth and centred his fortunes, whence he goes not forth without an occasion, from which, when he is absent, he is said to be abroad, and to which, when he returns, lie is sain to cease to lee abroal.'-cionl. 10, tit. 40, s. 7 . Even in Iome, questions of dmmicile were not withont importance, for the cmpire was divided for purposes of domestic guvernment, and the inhabitant of one frowince was not sulbect to the macistrates of another. lint it was in modern times, when Europe was divided into many imderemdent kinghoms, and Amerion was formed ont of states having different local customs and laws, that the law of domicile assumed its fill impurtance. It now constitutes me of the most diflicult hranches of urivate International Law (q. v.). The fullowing are its most general rulus: I. 'Tlie place of hirth is the original domicile of arery one, provildel that, at the time of his birth, it was the dumingle of his parents; but if his parents were then on a visit or on a journey, the home of the parents will be the domicile of lirth, natisity, of origin (ubmicilum originis). $\because$. If the chill is illecitimate, it follows the domicile of its mother. 3. 'The danicile ariginally oldained eontimus till a new one is acquired; muless it be lost lyy non-resindence, under the provisions of a statutro, as is the ense with paupers, for the purjuses of parish roliof in scotlami. 4. Ninors are generally decmed incapalile of changing their domicile of their owo aceorl, but it may be changed by a change in the domicile of the parents, which it follows. 5. If tho father dies, his last dumicile is that of lus willow and chiktren. ib. A wife follows the domiche of her husband. 7. The place where a man lives, if there he normmi for entertaining an opmonite presumption, is his domicite. S. If a person of full arst, having a right to change his domicile, takes ur his abock in a new place, with the acknowledsed intention of remaining permanently fixed there (unimo munmedi), that place inmediately becomes, and that which he has quitted ceases to be, his domicile. Questions as to what amonnts to intention, or what circumstances cunstitute sufficicnt
pronf of intention of remaining, or quitting a place of residence, are amongst the most difficult in the law of domicile. Most persons who are resident abroal have a sort of fonting untion that, in certain concervable circumstances, they wond return to their native country, and to these vague feelings
 One of the most immortant effects of the law of domicile was as to the validity of the will which a deceased person leaves-the English rule leing, that it must be according to the jaw uf the domicile, wherever the will was made, thongh the law of Scotland allowed a will alsu to be grod if it was expented according to the law of the cuntry where it was made. A statute, however, was passel in 1S61, to make the law uniform, so that the will of a Fritixh sulject, as recards personal estate, made nut of the Unitel Kinchom, is dement valid, wherever his donaicile may be, if the will is conformable to the law of the conntry where made, or to the law of the domicile of origin. Ami hy a later statute in ISGS, even as regards real or heritahle estate, an English will is to have offect given to it as regarels property sitnated in scotland. It is impossible, in our limits, to enmerate other effects of the law of domicile. Generally, it may be stated that it regulates the suecession to personal or movalule property, which is said to follow the person, and must be dis. tributed after death accurding to the law of the country of whieh the deceasech died a domiciled citizen. LIeritable or real property, again, descends in accorlance with the law of the land in which it is situnted (las cil siter). As to the eliect of a domieile of citation in Scotland in actions of divorce, see Divoree, Mariniage.

DOMINANT, in Mrasie, the fifth abowe the tonic: the ruling or govering tone of the key. Ancient writers called the cmminant the ruinta toni, from its beine the next in importance to the tonic. The dominant chord is always a majo chord, the third being the sulsemitomium modi, wr lealing note, which always rises a scmitone to the traie. The dominant seventl is the najor chorel with the that serunth above the duminant, and is the same in majer aud minor keys. The rules fur the treatuent of the dominant sewnth, and for the chord of the ninth on the dominant, apyly to all other churds of the seventh or ninth, which arise from the wher degrees of the seale. The dominant surenth is a must iupertant chord in molulation. The resolution of the dominant sevently is always into the chomb if the tonic, when mot interruptend. The elmmant as a key is the nearest in relation to the tomic. Alomblulatim inter the key of the dominant is so frequent in combperition, that its form may le suid tu he stemotype. The mblominant, we moderdominant, stamls next in importance to the doninant, and has its phace on the furnth alowe the tonic, ar, which is the sime. on the fiftlo below. Tha chert of the submoninat is majur or minur, accombing the moxle of tho hoy. The chombs an all wher te grees of the seate, beinis either mine or diminished, cive serater impertance to the mane charis of the tonic, fominimat. and sulumminat, in whiche cherds all the mon's of the spald are fomm. while the combination of these chompls, givines the mont ferfoct impurssion of a bas, may acemat for the ir bing of such importance in hirmenes:

15,000: and the principal huildings are churches, including a eathedral, convents, hospitals, eolleges, larraeks, an arsenal ant a light-honse. Its name has been extemked in sarious senses. It has been applied to the whole island, practically superseding the 'Hispanola' of Columbus; and also to the French or west section of 1Iayti, as distinguished from the Spanish ar east llivision, in which the place is situaterd. From it, also, the last-mentioned portion has derived its "pithet of 'Dommiean' as a separate teritory. Sice Hart, and Donivens lieptrlic.

## Do'minte, Sr. See Dominicazs.

DOMINICA or DOMINIQUE, a British West India Islami, lics in lat. $15^{\circ} 15^{\prime} \mathrm{N}$, and long. $61^{\circ}-24^{\prime} \mathrm{W} .$, containing about 290 square miles, and (1570) 28,517 inhalitants. It is of volcanic wigin, hot and sulphureous springs still attestimg the fact. It is the Joftiest of the Lesser Antilles, attanins, at one point, an elevation of 5314 fect, ame mearly un-balf of the surface consists of precipitons mountains and deep rasines. Where capable of cultivation, the soil is fertile; and, even on alyarently inaccessible sites, the emancifatel negrues have snccessfully established procision gromnts. The griucipal prodnctions are sugar, coffee, cocoa, cuttur, tolacen. molasses, rum, copper ore, sulphar, incligo, rose-wood, and other cabinet wouds. In 1556, the exports were 509,755 ; in 1S66, 106,452 ; in 1570, 462,24 . The imports in the same years were respectively $\pm 64.121, \pm 62,18 S$, and 400,278 . In 1stio, tho tommase entered and cleared was 15,777 tons; in 1565, 16,176; and in 1851, 19,160. In 1870, again, the revenue was $x[5,201$, and the expenditure, including repryments of loans, was 515,248 ; while, in 1849 , the returns had given $\pm 8577$, and $\pm 10,539$. The lacislation of 1557 apropriated $\pm 700$ for the purpose of affering aid, makler statutory regulations, to sehools of every deumnination-a liberality which, while accerted hy Protestants, whether of the Church of England or of dissenting bodies, does not appear to have been appreciated ly the homan Catholie priesthool. The abolition of avery, independently of inferences to be drawn from correlative statistics, is admitted by all parties to have worked well in Dominica. In is3 , the planters at a public meeting acknowledged, 'with feelings of ummixed Eratification, the peaceable and quiet disposition erincal by the labwures, as a body, since their contire emancipation ;' amd, in 1852, the hentenantgovernor officially adverted to the prosperity and contentment of the sume class. It is eren said that most of the 29 members of assembly are men of cobnh. The temperature, according to season and altitude, rances from $8 s^{\circ} \mathrm{F}$ down to chilliness; and "yon in tha dry montlis, from February to Amgust, main frepucintly falls.  werks and two days, the ledters an bambands two days every lap-year. If in the heriming of a ken-year the dominical letter le $6, \mathrm{~A}$ will be the doninical letter for the next yar. This extrame nary retrocession, howerr, is maho to takn phace at
 artifice of marking it $1, y$ thas stme letior as the day precoding it, and thus the next sumday is narked ly the letter preceding that which marked the smadiys before the intorealary day. Suppose the 2Sth Fohruary in a lear-year to le a Sunday and marked by F , it is evident that the dmninical letter for the rust of the yar will he E . As every fourth year is a leap-gear, and the letters are seven in munber, it is clear that the same order of letters monst retum in four time's seven, or 28 yoras, which would, but for the leap-years, recur in sown years, and bence the solar eycle $(\uparrow, v)$. The dominical letters were first introducet into the calmalar by the early Christiaus, to displace the numbinal letters in the Roman calendar. They are of use as a means of discoveriner on what day of the week any day of the month falls in a given year. See Easter. Rales and taldes for finding them are given in mayer-books, breviaries, \&c, ats well as in works on Dates (q. r.).

DOMINICAN REPURLIC, a state formed uf the Spanish or east section of Hayti ( $1, \cdots$ ). Spain. in 1697 , survendered to France, by the treaty of Ryswick, the west part of the island, retaining the remainder down to 1795. In the year last mentioned. however, the Spanish portion hecane nominally French. In 181! the west having vimbated its independence-Frauce formally relimuished, in favour of spain, all claim to the cast. In low, the colony, in huitation of the eontinental pussessions, threw ofl' the yoke of the mather-comintry, to link itself, more or less closely, with its African ncishbours. But, in or abont 1s 43 , it assumed a separate standing as the Doninican limblic. In 1861, after a troubled pxistence of seventeen on eighteen years, it exchanged its constituted auarely fir the somewhat despotic protection of its former musters. But in $156^{3}$ a revolt broke ont, and, after some fighting. Spain again gave up the pessession. It covers fan more than half the area of the island ; but, wreatly inferior in proportion of population, it contains anly 136,500 inliahitants. Since latit, the republie has been disturbed by intestine struggles.

DOMI'NLCANS, an order of preaching friars in the lioman Catholie thur ho (Frutres prodicatores), fommed at Toulonse in 121.5 ly Dominic (Domingo) de Guzman. Dominic was born at Calahorra, in Oha Castile, in 1170. He stanied theology at l'alencia, and in 1109 hecame canon and arehdeacon of 1 sma in Castife. In $100 \pi$, along with his superior, Diego de Azebus, Rishup of Osma, he legan to itincrate through the sonth of France, for the purpose of converting the "heretical' Alligenses; and cowsinced that the igmonace of the people and the wompliness of the elergy were areat helps to the progress of heresy, he instituted the order which

 which, after $1 \geqslant 2 \mathrm{~s}$, when the first comvert was estaldinher at Rome, spread far and wide. These mus followed the sanm rule as the friars, and wore solemmly pledered to ladits of industry. A thive Bominican merer (the Khights of ('lhist) was establishold in 1202, and contirmed in 1279 . It was uriginally a compary of knichts and nobles who hai leaged themselves together for the suppressime of "heresy' hy force of arms, hat after the death of its fommer, the orter was changed into that of the Penitents of st Dhominic. The memarrs of this hanch of the 1 . were also called the Tertiary Dominicans. They were mot bomil by any sows, lat their special duties were to olsersis particular fasts and devotions, and to execnte wreat ecelesiastical judiments. They retained all their eivic and domestic privileges. There were also female fenitents of it Jominic, a fow of whon, howerer, betook themselves tor a conventual life, and hecame nons. 'These few were chictly in ltaly; the most famens was it Catharine of Sima. The glowy of apostolic foverty, which encircled the D ., the privilegus which they possessed-especially of preaching and heaing confession-and the circunstance that as emly as lwin, only fiftem years after the fomulation of them order, thes serment a chair of theolugy in the great minersity of Paris, all helpod to rapully incrase their $\quad$ numb Within six years after thuir estalidshnent, they had spreal to England throm ono dilluert In Fresney; and fonded a monastery at oxforl. 'The nomks,' writes the contemparary amalist. Hathew I'aris. himself a benedictine, "dil mot, in three or four humbel years, ascemb to such a hecingt of ereatmeas as the friars, minors ant preachers, within twentyfour years aftes they hecgan to lomind their first honso in Englanl.' Their purress was sarcely less rapin in Scotland, where they fimme a muniticent patrom in King Alexamder fl., who is said twhare met st Dimninice at l'aris almont the year 1017 . In Britain, the Dominicans were called the Fhuck Frams In Franer", they received the name of Jacobins, from the: line St Tacyus: (Lat. Jocobus) in l'aris, where they first established themselves. Their monasteries arnse throughout all "hristembow, and were even to he soom om the shoms of Asia. Airien, and subsequently Ancrica. Their monarehical constitution, which homel all the hanches and comeregations ont the order muler me grand head (mayister orfinis), insured their pongess and the co-nperation of their eflomes to secure inthence in chareh and state. Through their preaching and proselytising, it is noderiable that they exereised. at the time of the

## DOMINIS-DOMINUS.

foundation of their order, and for a considerable time after, an inflnence alike extensive and beneficial. They have yroducell several great seholars and men of genius, such as Albertus Magnus; Thumas Aquimas, the normal theolomian of the Cimuan Catholic Church : and Raymund de P'eanaforte. 'They have. however, acquired a black repmtation in history in connection with the Inquisition (1.v.), in which they were the chief agents. After 1425, when they olstained permission to acecpt endowments, they in some measire refrained from begging, and engaged themsclves more with pulities and theology. Their great rivals were the frenciscens (q.v.), and the mitual animosity of the two arders was strongly exhibited in the disputes of the

Dominican, or Dlack Friar.
Thomists aml subtists. Thase two urders divided between them the honomr of controlling the ehureh. and uften the Catlirlae states of Cluistendum, until the rise of the Iesuits in the I6th c.o whon gradnally hruve both from the schools aml the court, when the I. were campelled to retum to thate ariminal voration. Their jowar was, huwerer, again revived tu a certain extent in $[4,20$, when the cinsuming of Lonks was cunferreal on the Naster of the Vatican at lionne, wham mat indwas be a lrominican. In the 1 Sthe e., the orim of $[3$. pussessed 11000 monasterius and convents, dividel into 45 provinees. besides 12 separati cuncrematmas or sects.  abl two Bats later, Arehbishon' of Chalatro, in wheh rapacity, however, de quarreded with the
pope, and having, moreover, exhibited certain Prutestant leaniog, he found it expedient to resi in his post. In 1616, he eame to England, where he was hospitably receivel. King James aplointad him Dean of Wrimdsor; and while holling this office, he wrote his De Republica Ecclesinstica, a work in which he endeavoured to slew that the pope had no supremaey over other bishops, but was only primus inter pares. D. pmblished one or two other productions hetween 1617 and 1618; but finliny Anglicanism far from satisfactory, a revalsion of feeling occurred, ant D. once more louked and longed for the unity of the Catholic Church. The motives that induced him to retmon to the lioman Catholie Chureh are not known. Most writers consiler that he was actuated by avarice and ambition, but a critical appreciation of his character would lead us to donlot this harsh judgment. He was, it has been supposed, desirous of discovering a chureh broat enongh to form the lasis of a nniversal Christiamity. Men holding such opinions are always misunderstoon, and so 1b., even after bis return to Rome, was still snspected of heresy. In eonsequence, he was inmmisoned in the castle of St Angelo, where he died, September I6?t. Being subsequently condemned as a heretic, his body was raised from its grave, and bmonel.

While at I'arlua, 1. wrote his De Radiis Ïisus et Lucis in litris Perspectivis et Iride (Venice, 1611). He was the first to proint out that in the phenomenon of the rainlow, the light undergoes, in each rain-drop, two refractions and an intermediate retlection.

DOMI'NIUM, a Roman law-term, whieb has heen received into the technieal language of most of the legal systems of Enope. It may lee described as a full lemal right in ami to an object-as the right from which alone legal possession could flow, but which actual possession alone coull never confer, unless snel ] ?ossession had tudured for the perion nif legal preseription. The right to possess is thus distinguished from the right arising from fossession, which is the usufruct. Ownership or clominium may be either absolute-that is to say, it may inelude the benelicial interest in the subject-or it may be bare ownershys, consisting in solue limited power over it at the time, or some nltimate right. to it at a future timu. I omininm nust not be couffommed with $1 m p u r i m m(q . v)$, which Inas a totally different sisnification.

DOMIN(), the mame formerly given to the garl, wonn in winter by priests while otfeiating in eoln edifies. It is now usel to sismify a masquevade costume, consisting of an ample eloak or mantle with wide sleeves. See Masqubrader.

IonMINOS, the mame of a qame, usually played with is whmpe, llat plieces of isory or bome, \&e. each of whinh hoars two numbers marked by printes from monglat to six. The porty wins who hats lirst playoul out his tallets, or, if this las becen fonmel impossible, who has the fevest proints on the tablets still remainmg. 'Jhe game of ilomimas has heon attempterl to be traced back to tlue Greedss and Ilebrews, and also to the Chinese. Su mole is eertain, that it was introduced abont the lominnine of the Isth e. from Italy into Frames, where it immerlithely fermue fomatar in the largur towns. l'rom ['aris it spread to Germany, where ats in France, it is mow playl in every
 boistol of asscmbling the most expert players; an honnme, howevor, which was warmly contested by tho (estathlinhments of limen and lootiers.

100'M1NUS, the latin worel by which we commonly render lord, Lut which more properly
significs master, as oflowed to slave (wrows). Aurelames is said to have bem the first amporar who adopited dominus as at tite of hombur on his
 versatoon and in correspumben" in that sonse, ay by Pliny in addressing Trajam. In lagal phaseedary. the dominus litis is the person rinlly inturestial in the issue of an action, thongh not mocessarily the pursmes.

 younger brother of Titus, whan ho surecealed in the throne. The earlier years of his reign were on the whole idvantagenisly asenpien for the pmblic benctit. Many good laws were passent, the pmoneres earefully govmed, and justice rigilly aministeres. As he grew older, howerer, his ambition, his jealonsy, and his pridr, woumion by the failure of his canbaigns against the Dacinos and the Dareomanai, in 87 A. D., began 10 instigate him to the most atrocious crucltios. By murder or banishment, he deprived Jome of nearly cvery citizen conspichons for talcut, leming, or wealth. To win the amy, he greatly increased the pay of the soddiors, and securat the favour of the people by prodigal lareesses and dadiatorial shows aud games, in which he sonetimes took part in person. 11 is cruelties became at length so intolerahle, that a comspracyeneouraged, if not organised-hy his wife Domitit, whom he had doomed to death, was formed against him. and the tyrant fell nomer the darmir of the assassin, 18th Seqtember 9 A. A.

DO'NO D'OSSOLA, a charming little town in the extreme nonth of Picelmont, at the fout of the Simplon, near the right lrank of the Tosa, which Hows moto Lago Maggiore. Its general nspect is peculiarly Itahian. It has some trale and several haudsome lmalinigs, but is chielly noteworthy as leing a starting-point for tomists who wish to make excursions up the southern valloys of the Alps. The chief places of interest in the vicinity are the Val Anzasca, the Yal Vigezzo and the Falls of the Tosa. From 1). It. the Simplun can be ascended in seven hours. l'op. 2480.

DON (anc. Tamos), a river of Itussia, has its sonrce in a small lak" in the povernment of Tula,
 flows at first in a southeastern direction flumuth the governments of Tula, Fiazan. Tambew, and Woronctz, and after wiading snath-west throngh the country of the Don Conssalks, it alvances to its embonchure in the Sea of Azos, which it enters by three mouths, only one of which is uavigalle. The Don receives 81 afluents, of which the prineipal are the Sosna and the Donctz on the right, and on the left the Khoper, the Mcdviclitza, the sal, and the Manitel. Its tutal lengih is about ! 900 miles. Its course is olistructed hy frequent samd-hanks, which, when the water is low, render navigation impossible to any but dat-bottomed loats. From Aril to Juse, however, eluring which monthe it overtlows its banks, and forms unwholesome swams on either sike, it is navigable as high as Zutunsk. 600 miles from its month. The Don is conneted by a canal with the Volga, aml by this means the produce and manufactures of the interior are conveyed to the sonthern provinces of liussia. The waters of the 1 bun aboum in fish, the traffic in whieb commolity is considurable, especially in its lower couss.

DON, a river of Aberdensline, rising on the west border of the county in a puat-moss, 1640 feet above the sea. It runs morth-east, then east, and lastly south-east, enterimg the sea a mile north-cast of oid Aberdeen. It has a total course of is miles, but
only $\mathrm{f}_{2}$ in a etrabith lane and it draims a tract of
 gneiss, wath a lithe syanite amd clay-slate. In the upper part of its comere, it reccives some large monntan streans, lint its chinf tributary is the I'ry, Which fomes \&? milus from the north-west. Near the junction of the liry and bon is a curims conical Gravel hillock, eallol the Bass, the subigeet of at proplery by thanats the libymer. The bom, at lows than a mile from the soa, is evossed by the ahl 'Jrig "' Batgownic,' of one (dothie arch. Lord byrom, while a someth, had a supurstitiond dread
 nectal wath it. To' keep this budge in repair, Nir Alexamer Has, in 160., J it an amuity of $x^{2}$, 5. Sad. Whicls sum has mow acommated to
 thirty years ago in the erection of a now hringe ower the Don, it quarter of a male luwer down.
DON, w DON, a river of the Thest lialing of Sorkshive, rising in the mons on the lureless of
 south-rast to Cheliche, and thon motherast ley Bothritam, Doncaster, am] 'Thornc, intu the Aire, which some aftersards mutes with the Guse. Its Iasin consists of Codnomiterous and l'erminu strata Its chicf tributarics are the Rother, Dearne, and Wento. It is navigalde for the last 39 mbes of its comss below thedidh, ly the aid of atimeial canals and cuts.

Don PENTTO, a town of Sain, in the province of lamajoe, 5 s miles east of the eity of that name. It is situaterl near the left hank of the Guadiana, and is in general well hnilt, with wish and tulerally clean strects. It has sevrabl spuares, thr ehief of which 13 lined with the principal structures in the town, inchuling the town-hall, prisom, and a conwent; and in the centre is a public promeuade. 1). 1b. hats mann. factures of woollens, wine, and oil, and its proxmuty to the Guadima affords it great tradug facilutes. Pons. abent 15000 .

## don Cidrlos. Sue Carlos.

DON MUAN is a legmedary and mythical persounge like fratus. The two have lecen mate the represmatatives of two different tumbences, leoth proceching from the sane principle-from the pmciple, namely, of mulnef and gullossuess, which neeessarily turns self into either a winl or a beastthe prineiple of subjectiviom, or seltishanss hecome dommant. In Fanst. "xpresemon las bung given to the suljoctive idcalism of the Ciemmanc nations, their tembucy to sulde speculation amb a rationalism antagonistic to faith. In 1). J. apluar the practical materialism and refined semsualism of the linmanic peoples and the tendency of hind belief in acorrunt cathulicisu to pass intw unbedict.
Althourb Fanst and 1). J. have thus the same sonree arin] the same termination. yet, as they proced from "unnsite proles. they stind in contrast to each other. ancl, as was natural, have fimond different vehieles of expression-Faust in Jentry, I. J. in musie. The ifeal of the D.J. legend is presented in the life of a protigate who gues limself up so entiredy to the gratilication of sense, especially to the mist jowerful of all the impulses, that of luve, that low acknowledees no hichuer consideration, and pmeserls to murler the man that stands between him and his wish, fancying that in so denng lue hail amihilated his very existence. I'artly in wantom daring, partly to allay all measy masgiving, he then challenges that sprit in which be dusblieves to demonstrate to him its existence in the only way he hohls valid-namely, through the scuses. When this actually lappers, when the spirit proves its existence and pow ly animating the marble statue
which he lad, with daring mockery, invited as his guest, and summowise lim to the final trilnual, compls him tir acknoledre the supremacy of spirit, ame the worthlessness of a merely sensmus, gentuss. and inmural existence, it is all orer with him, he is crushel, and sinks into hell.
This ineal career is aptly enongh lucalised in one of the most luxurious cities of the once world monarchy of the saracens-viz. Sevill-am the characters wear the names of the anciont noble families of the place. The hero of the story, II. J., is described as a momber of the celemated family Tonorio, and is remesented as liviny sometimes contemporary with Peter the C'rack. sometimes with Chates V. The chnef am of his sinful catere is the seduction of the danghter of a sow ornor of Seville, or of a nobleman of the fawily of the llowas. Beins opmed ly the father, he stalds him in a alnel. He then forees his way into the fannly tomb of the murdered man, within the convent of Aan Francised, cances a feast to be prepared there, and invites the statue which had been erected to his victim to be bis quest. The stone guest appears at table as invited, compels D. J. to follow him, and, the measure of his sins being full, delivers him orer to bell. At a later perime the legend cane to lue mixed up with the sury of a similar profligate, Juan de Miarana, who had in like manner sulil himsele to the devil, but was at last converted, and diel as a penitent monk in the odour of sanctity.

The genuine legend of D. J. was first put into form ly Gabriel Tellez (Tirso de Molina), in Lt
 drama was transplanted to the 1 talian stage about 1GO , and soon found its way to l'aris, where numerous versions of $i t$, ammong uthers Dloliere's Fextin do Piove ( 1669 ) male their alpearance. It was bronght on the English stase Joy Shalwoll mater the title of The Lilurtime (1070). In the end of the 17 th c., a new stonish version of 'Pellez's phy was $1^{\text {rec }}$ fared by Antonio de Zanoria, and bronint on the stage. It is this version that fums the rommero of the later 1 talian versions and of Nazart's "pera. It was tirst phit into an "preatic form he Vincenzo lighmin in Il 'ompitetu olf P'ictme (17:7); the text of Mozart': Jon Griorennt was written ly Lusenza da Ponte (1750).  of the laran, the result of owerwors, shewen itsolf first by nemalcic pains, and attorwams by mare alarming symptoms. Ho romosod to Vamulan, and (lied in his mother's honse, atter some weoks of ereat sufferinu, lame with caln aml jationt commara, on the lothe of Febmary 1861 . Ln private life, he was distingusled by kinduess of hoart, realy wit, unfailing vivaeity, and viried conversational powers. It sught, perhaps, to be montioned that it little work, puhbsed anonymonsly under the title of l'hildentherves inglememes, which made no small sensation at the time of its aperarace, has been very gencrally attributed to Dr bomalelsen.

TONALDSONG HOSPITAL, an extensive estallishment at Edinburgh, of the character of Christ's IJospital, London. Its foumbre was Iames Tonaldson, a snccessfal printer in limindurgh, som of Alexamber Donaldson, pmblisher, of whom some notice is taken in the articles I'mak Thame and C'orreigent. In 1763 , Altwander stanted the Edinharoh Adrotiser newspaper, which was afterwards conclucted by his son James, aml lereme a lucrative concem in his hands. Dyine in $18: 30$, James bequeathed the fortme of two generations, amounting to about $\mathrm{s}^{2} \mathrm{~s} 5,000$, to trustenes, for the endowment and rection of a hospital for the maintenance and education of por boys and givls. The building, which ocenjies a erommandiner sitmation to the west of Edmbinsh, was hemon in ISt?, and finished in 1850 , is a larere amel benutiful quabrangular structure, in the Elizincthan style, the late W. II. l'ay air boing the arelatect. I'he cost of the edifice amd fumblungs was nearly dex, 100 , Jont as this was lefrated biy the alecumulated interest, the orisimal chlowment remained untumehed. The hospital can accommodiate ;om ehildren- 150 loys and 150 eirls : at 1 resent ( 1573 ) it contains 220 children $(124$ bugs and 166 girls) of Whom $9 ; 3$ (56 boys and :37 mirls) ar. duaf and slumb. Those ellgilde for armissiom are cleclared to lee, 'Ist, Poor chiliden of the mane of Domaldson on Marshall, if appearing to the gevernors to he deserving; $\stackrel{\rightharpoonup}{l}^{\prime} l$, Such poor ehildrem as shall apmon to be in the most lestitnte circumstances and tha most cleserving of admission.' None are receverl whose parents are able to maintain them. 'The children are elothed and maintained in the hospital, and tanght such useful hranclues of a pain binglish plucation as will tit the boys for trates, and the givls for being servants. The age of admission is from six till nine, and that of leaving the hospinal fomben years. The children wear a simple miform of moderi fashion.

DONATELLLO (properly, Donito di Betto Pateni), one of the resthers of the art of sendisture in Italy, was horn at Florence in las:. He belonged to the Donato family, which reckons several seholars among its members, and has given some' doges to the republic of Venice. Donutello was a dimintive given to the artist in chilhthool, He received his earliest instructions from Larenzo licei. His first ireat works in marble were the 'St l'eter' aml 'st Mark' in the churel of st Michacl in his native city.

DOXATISTS were the followers of Donatus a Numidian hishop who anmosed the election of Cecilianus in 31I A.D. to the bishopric of Carthage. on the ground of the ordantion having been performe 1 lyy one who had been a Traditor, or traitor-that is, one who, during persecntion, had given up the sacred books to the paran anthorities: aml also because Cecilians lawl exhilited great hostility towards the victims of the late persecution. After some time, the Comacil of Arles (August 1, :314 A. i.) deeided againat Donatus, who in a short time seceded from the Catholic Church, and formed : distiuct sect, which, by 830 , had as many as 172 hishops in Northern Africa. The D.. like the Nowatians ( (1. 豸.). Went upon the prineiple, that the essence of the trie chureli consisten in the purity and holiness of all its members individually and unt merely in its apostolieal and Catholie fomdation and linetrine. They therefore hoth excommanicated all lapsed and gress otienders, not receiving them agin lout on being re-baptized, and also held that the efficany of the sacraments lepended on the worthiness of the administrator. Driven to fanaticism by the opression of the secular power, they not only demied to the state all right to medhle with ecclesiastical affairs. lut hands of Donatist aseetics collected, attacked the imperial trons (348), and contimed to devastate Manritania and Xumidia for a dozen years. In the leginning of the 5th century, they seem to have anoost equalled the Catholics in number, and the eloquence of Augustine and the severities of Honorius were exereised unon the sect in vain; they continued to exist as a separate body. But hy aloping a more prulent plan of procerding, the Catholic hishops buld, by the end of the 6th e., induced most of those that had left to return to the bosom of the chureh; and in the 万th c. the D. wervextinct. Donatism is regarled hy Neandir (see Dommentrechichte, translated into Jinglish hy J. E. Jiyhail: Bohn, vol. ii. page 394) as a reaction achinst that form of Cithohicism, 'which conceived the church to le an ontward oryanism, continued ly the succession of hishops, whe formed the necessary medinm of eommunication with Christ, and for partaking in the Holy stinit and salvation.' 'Whocrer is shewn to be a Clristian in a right and lawfol mamer, is to nee a Catholic,' was a saying of the $\mathbf{1}$.; while the Church in ganeral, guided by Ausustine, wished to let the worthy and unworthy remain mixed together; and to defor the separation to the linal juigment." Thus, whate the D. had the merit of superion strictiness of theory, it must he adnowlodgen that their views were less practieal than those of their opponcuts.
JơNATLS, Tams, a wdlknown grammarian and commentator. who taught prommar and rhetorio at fomme alout 2.5 A. 1 , and was the instructor of Sit deromes. Il. wrote treatisus, bo Literis, syllabin,

and there was an old French praverb, Les diables estuient encore à lour. Donat (The devils were yet in their grammar). The Latin grammar of D . has formed the grommwork of the elementary treatisus on that subject to the present day. Douatus was one of the lirst books on which the art of printines by means of letters cut on wooden blucks was tried, and copies of these Donatuses are reckoned among the greatest of bibliographical curiosities. The anthor ilso wrote a commentary on Terence, of which we possess only a part extending to tive comedies, to be found in the edition of Terence lyy Kioz (2 vols., Leip. 18:38).

From this D. we must distinguish a later grammarian, Therits Claudus Donatus, from whom we have a very worthless life of Virgil, prefixed to many editions of that poet, and fradments of a commentary on the fineid.

DO'NAUWORTII, a town of Bavaria, sitnated at the confluence of the Wermitz and the Danube, about 2.5 miles north-north-west of Angsburg. It is well lmilt. in the form of an amphitheatre, round the side of a hill, and is surommeded by walls. It was formerly a free imperial city of considerable inportance, but it has now sunk into an insigniticant phace of 3000 inhabitants. It is historically interesting, however, as the main eanse of the Thirty Ieas' War ; the severity of the punishment meted ont to the inhabitants in 1607 , in consequence of their adoption of the Fefomned doctrines, and their assault on a Foman Catholic procession of the "host," having lel to the formation of the Protestant League, and Catholic Union, the opponents in that long and serere struggle. It is likewise associated with the name of Marlborongh, who stormed ant carried the intrenched eamp of the Bavarians here in 1704. Also, on the 6th Oetolner 1805, the French. umder Soult, oltained a victory here over the Austrians, umer Mack.
$\mathrm{DO}^{\prime} \mathrm{NAX}$, a genus of lamellibranchiate molluses, of the family Tellinider, with shell of two equal valves, which close perfectly, and are of a triangular form. prettily striated from the beak to the margin, the beak oceupying the olttise angle of the triangle. The species of $D$. are generally small. Several are found on the British coasts. The fossil species are not numerous, and belong to the cocene formation.

DO'NCASTER, a muncipal borongh in the West Riding of Yorkshire, on the right bank of the Don, on the Grat North lioul, 3 is miles sonth of York. The comntry aromil is that, but beantiful. Fine old ams line the broad amd level roal from the sonth. 1). is very clean and well huilt. The Fligh Street is a mile long. It has mamuactures of iron, brass, sacking. linen, and agricultural machines. Its cornmarket is one of the largest in the kinglom. Pop. (IST1) 18.728. D. was the metient I? anum, and liay on the liman roal from York to Lincoln. Foman chins, urns, and a votive altar have been found here. It was the Jone Cistre of the Saxms. The Saxom Northumbian kings haw a palace here. D. was burned by lishtning in 759, and frequently ravaged by the bunes. It has long been famons for its anmal raves, legun in 1703, and held a mile sondheant of the twin in the scrond week of septomber.  is also a plate of consideralile trate. Its exports are elnedy slaves, in return for which it receives gromes of all limes from Cairo. Its bazaar is well supplion, anl it has an indigo-factory belomins tu the Eypption pasla. Pop. estimated at 5000 NB 60m, In the vicinity, on the fertile river-island "is Arev, wo the ruins of old Ethiopian and Egrydian huildines, colossal statnes, \&c.-Oln DoNionat is : mined town on the right bank of the Nile, न. mules south-south-east of New Dongola. On the erast sinfe, the descrt in sone places stretehes down to the water-adge.

DONLS CONTDITIONALIBC二, SINTUE NE, called also the Statute of Westminster the seennd, 13 Eifw. I. e. 1 , is the statute which tirst established in England the power of creating an Entail (q. v.). Bufore the passimer of this act, it had lnew halil liy the juiges that a convegance to a man amb the latirs of his holy was a fee-simple combitional. i. '•, a Fecsimple (r. v.) on condition that the lamee shonld have hers of his borly: and this econdition having been frimitiod by the birth of an heir, the donce was at liberty to alienate me liman the lame, and thas to delent the original gitt. In this mespect, however, the gift ditiered from a fee.simply that if the done finiful to exerese his puwer of alrenation, and died withont issue survering the land desernderd not to the heirs of the donere, lout tor thase of the honor. T'o comateract the decision of the judgesis above noticed, the statute de douis was passed. It parided that the wall of the griver, aceurding to the form in the ded ut wift maniestly expressent, shall $l_{0}$ from lemedorth olserverl." "From the date of this act, the courts recugniser thon estatus in the lime-vize, that of the donee, which is coalk it Fees-tal (y. r.), and that in the donor. which was a reversinn wexpetaney, by which, on the termina. tion of the estate-tail. the lands world revert to the miginal owner. As to the nanmer in which evon thas intention was aleteated, see Exiant. Not only lands, but rents. limities, de., michat he entailed undur this act. Co, Litt. 20 a. See ExTail.

DONIZ1: TTI, GAEFANO, a famous Italion composer, was born at Dergamo, in Lominaty, 179 s . We leamed the elements of masic at the $\mathbf{L}_{\text {secenm }}$ of that town, and later, the art of emposine muder Simon Mayr. D.'s first ermpositions belonged wehnsively to church-mnsic, but the whly success he notained by then was an appointmont as a chorister at the ehweh of Dasilica di sam- Dlagerme. J). gave m that pusition very som, aml after several ticiositades, entered the military service of Anstria. 10. now levoted limself to the eman bosing of operas, of which he has left mome then sixts. Bhate de Beregomu, 1SI!, with ninten others that followed, fallel to promee any mankel resmlt; and it was not watil 1831 that his renown bepin to spread beyond Italy. Innw. Boleme,
 Lucke di Lammermoor, La Fille du lŕgiment, fu?. lowed each other in rapid snceession, alding now lustre to his fance J.'s last pornctions were Don Squestimo and Cuterino (onmero. De died at Wergano in lSts. Amomy momern Italian comaposers, F . is reckoned to be mearest to liossini, whose style he imitated during the first stacge of his career. D.'s music is praised mit so much for melody as for irmatic truth ami solility of exceution.

Do NJON, or IOTAGEON, the prineipal tower or kee] (4. r.) of a eastle (1-r.) or fuptress. It was so called either from heing places on a flem or elevation, matural or artificial, or heanse, from its position, it dominated (Lat. clominio, commpted into ctomgio, tongeo or commandel the other parts of the fortress. From the circurustance that the lawer or underground story of the donjon was used as a prison, has come the modern meming of the word. Sue C'sstle.

DONNE, JOHy, D.D., the som of an eminent merchant. calet of an ancient family in Wales, was bom in Lombon in 15se. His purnts were Catholies, and he was educated in that faith. At the age of deren, he went to (bxford, where he remained three years; thereafter, le remored to cambridere. Althonerh he greatly distinmaished himself iat these seats of leaming, the faith of his parents preventerd him fron taking a derree. it the ate of $1 \%$, ho "ntwred Limenin's Inn. to real for the bar: and while so encosed, he arefnlly standied the prineipal points in dispute between C'atholies and J'rotestants. and timally joined the latter. Abont this time, les wrote seceral of his minor poens, the erotic heat of which contrasted strangely with the ansterity of lis later years. la liovt. he went almand, and lived for three years in spaim and Italy. On his retmm, he was made secretary to Lore blhesmorn, then lard liepper of the Great seal. Here hefell in loy with that mobleman's niece, and they were privately married. When the mion wits discovered. (1). Was imprisoned by his 'motural father-in-law Aftur his luseration, he recovered his wife by lemal [mocess, aml, withont settleal employmunt, went to resibe at the lomse of Nir limacis Voobey, a kinsman of his wife. After the death of Nir Frameis, ho rembed tu lamion, and lived with Nir liobert Drury, in lorury lame. With Nir Rebrert he went tu loris ; and on lisis retion, at the instigation of dunes J., when was didiehted with the PientoMrepty, a hook which 1 , had written iquinst the?

DOOR Axd DOORWAY, in Art. The form of the domway is determined by the arehitectural style of the lmiding in which it is pheed. In chassical humdings, it is generally rectangular in form, thonch both Greeks and liomans, following the Fapotions, anongst whom the practice was almont miversal, necasimally diminisled the openims towarels the top; and the lomans, in fater times, very fresuently threw over it the cirenlar arch, which was the characteristie feature of their styb, berytian domways are known to ne, for the most part, only ly the examples which remain in mommental structures: and these, like the other mombers of the style as thas exhibitel, are of eigantio poportions. The dowrway of the temple at Eifn measures $7 \frac{1}{2}$ foet to ils summit, int the lint 1 and corniwe which cover it are so deep and massy ats to monpy a phace of no less than $2: 3$ feet, so that the hajit of the aperture is only 51 . With the Explians. the doorway was an architectural whiont if bery great importance. On cither side of it, colensal statues or thelisks were paxed, and the apmoach to it was olten lined with rows of sigantic splinixes.

The Greck dorway was sumounded ly mouldings, aml as the lintul or top-stone which covered it pros jected on buth sides leyom the janks, the mondings which ram roumi buth jutten ont at the place of mecting, fomines a sort of shmiders, as in the acompanying example. This arrangenent, howver, was by mo mens unifum, the monldings of the jambs leeing frepuently duite separated from these of the architrite, as in the leautifnl fonway of the Erechtheimm, of which an illustration is enpich from Ar bomatisula's worla , in bours. The doors themselves, in antipuity, in private dwellings, wer" renco rally of wool: and in strictures devoted tor rolinons or pmbie purpuses, of metal, and uceasionally ui marble. They were pencrally panelled, and thrned on pirots working in rockets. With the execption of the forms of the wimdows, and the tracery and foliage of the pillars, doorways are the most

 6.54
by the kind of mouling which surroumls the fanel, nud from the description of panel. The main objeet of framing, besides appearance, is to connteract the tendency of the wool to warp, by hinding the lifferent parts together with pieces having their fibres at right angles to each other.

In many old bixildiugs, the onter, and even some inner doors are male of massive oaken planks, bound toyether with ornamental iron strajs. Iron doors are chiefly used to intercept fire. For this purpose, they are lest made of wrought iron, with couble sides. Bronze dwors are sometimes nsed for churches and nther large lanikings. They are usually ornamented with rastings in high anil low relief. Those of the Baptistery of the cathedral of Florence, by Ghiberti, and the Panthenn of Rome, are among the most celebrated examples. A few examples of marble donrs exist, ehiefly in cemeterics anh some Lelgian churches.

DOORA. See Derre.
DOORN, in English, Thom, is a common name in South Airica. It indicates various eommunes in the Cape Colony. It also desimates two rivers, distinguished as Great and Little, both of them joining the Olifant, or Eleplant, on the right, but the swaller from the sonth-cast, and the larger from the north east.

DOORNBOOM (Acrecia horrilu), the most common tree in the wastes of South Africa. The name D. (Thorn-(rep), given to it by the Dutch eolonists, anil the botanical specific name, are due to the number and sharpness of its spines. It seldom much exceeds thirty feet in height, hut its timber is hard and tough, and is nuch usel for housecarpentry, \&e. Sece A"scra.

DOQUET, or DOCLET (from the same root as dock, to cut off or clip), a swall piece of paper or parclment. containing a hrief or simmary of a Jarge writing. All attestations or declarations annexed to written instruments are called doquets, more particularly those that are done by a notary. The notarial doquet is said to be the most ancient example of tixed style in Europe; and thongh latterly appropriated to the instrument of sasine, it Wais furnerly common to all solemn instruments. It consisted of a Latin attestation, holograph of the notary, amexed to the notarial instrmment preparet hy him. The name of the notary was set forth, ans the authority mentioned, lay which he hati been appointer to be a notary. In the case of an instrument of sasine, it stated that he was personally present with the witnesses; that le saw, linew, heard, and noted the circumstances mentionerl in the sasine; that he prepared the instrnment, anl the number of pares it contained. In addition to his subseription, the notary was formerly in use in Scotland to adel his sigmum, which was a flourish of the pen, ealled a paraph or ruck. Lattirly, he only subseribed the dacument on each page; and on the last page, mposite to the doquet, he added to his subscription the motto which he hai assumed on his almission as a notary. The notariad doplet of instruments of sasine was supersoded ly 8 and 9 Vict. c. 35, s. .5
bole. See Iown lhatie.
DOR, or NONTT DOR (often written less momery Mont I"Or), a chan of momains in France romprised in the areat ermp, of the Anvergne (y. w.) momatans in the department of Puy-de-Dome. They are clanly of volcanic formation, and rise in tho luy-rtesinny, which is the highest peak of Central France, to tha height of 6190 feet.

Dol:A'k a town of lersia, in the province of Kilmzistam, sitnated on a marsly plain at the
junction of the Dorak with the Ierrahi, lat. $80^{\circ}: a^{\prime \prime} \mathrm{N}$, , long. $45^{\circ} 50{ }^{\circ} \mathrm{E}$. It is surmunded hy a mud-wall, ani defended by a furt. The houses, which have sloping roufs, tre built for the most pert of sumdried hricks. liy at eanal which mates the Darak with the river kiam, a comsilcrable tralle is carried on. 10, is also refortal to have thaving manuactures. Bop, (wow).
 of Derreych. The ferpulation, nearly Sollo in namber, are chidly engacel in agrionltural pursuits. Tha. carnans from Mocar to Persia halt lure fo ohtain suphies. 13, was taken ly Ihrahm lashar in IS18, ami its inhalitants mealy all slanghered.

Do'ROAS sOCI'J'I'S, the name given to an association of tadies who collect and rispose of garments with the benevolent whect of giving aid to necessitons fanilies. Sometinses the ladies connected with a congregation mite to form a Doreas society, in order to afforl employment to pour neellewomen. Societies of this linit are so called irom what is recorded in Acts ix. 39: 'And all the widows stool by him weeping, and shewing the coats and garments which Doreas made, whle she was with them.'

DO'RCLIES'IER, a parliamentary and municipal burgh, the comity town of Dorsetshire, in the south part of the county, on the right bank of the Frome. and on the South Downs, 115 miles south-west-by-west of London. It lies on a slight elevation, is nealy eneireled by a fine aveme, and consists chiefly of three spacious streets. There is a cavalry barrack near the town. It lins a considerable trade in ale aud beer, and sends much batter to Loudon. J'op. (LS71) 6915, It senta no member to parliament. D. was the Roman Durnovaria or Durinum, a wallel town with a fosse, and a ehief Loman British station. Parts of the wall, six feet thick, remained till 1802. Near J. are the remains of the most perfect homan amphitheatre in Eagland, 2IS by 163 feet, ant 30 feut deel, the eats rising from the arena, cut in the chalk, and capable of holding $1 ; 3,000$ spectators. There is also a Lioman can! with a ditch and high vallum. A large British station oceurs near 1., with three earthen rimparts, a mile and a half in circuit, and pierced by intricate passages, and enclosing harrows. The inner rampart is 60 feet high. liuman urns, coins, and tesselated ${ }^{\text {macments have been fomi near }}$ Dorchester. In 1613,300 honses ant $\because$ churches were buned in the town. In the Civil War, many battles oecorred near Dorchester. Here, in 168 dudse Jeflieys, in his 'bloody assize,' sentenced to death, in two days, 100 persons, implisated in Noummeth's releellion.

DORDOGNE, a department in the south-west of France, formel of the ancient province of Perignord, with small 1"rtions of $^{\text {of }}$ Limonsin, Angoumois, and Saintonge, lies in lat. $44^{\circ} 35^{\prime}-45^{\circ} 43^{\prime} \mathrm{N}$., and long. $00^{\circ}-1^{\circ} \stackrel{5}{ } \mathbf{S}^{\prime} \mathrm{E}$. Area abont 3500 square miles. J'川. 480,141. 1). is watered by the Dordugne, which flows from east to west through the sonth of the department, and hy its tributaries, the Drome, and the ligher and Lower Vezerc. The surface is for the most firt hilly, and covered with brom and underwood, with hicre and there a valley of extra. ordinary beauty and fertility, enclosed with hills, the sides of which are generally clothed with sineyards. There is a mreat deficiency of corn, but the want, as an article of food for the inhabitants is surplied to some extent hy the immense prombec of the chestnuts. which, with the walnut and the mak, are the prevaliar trees in the forests. The climate is generally milid. Nines of coal, iron, and manganese are worked; marble, alabaster, and millstones
are guarried. The manufactures are coarse woollens, hosidery, Dranizy, nl, piper, \&c. D. carries on ronsidurable trade in irm, wime, hams, and trudted turknys. Thu arrmlisemponts are five in number vi\%, Jhemrae, Nontron, J'ergumx, fiberac, and Sarlat, whe frrimens as capital.
